giving a rate of heat-supply about 2 to 6 watts. The water equivalent of the calorimeter was about 85 grammes, and was determined by varying the quantity of water from 140 to 260 or 280 grammes, so that the final results depended on a difference in the weight of water of 120 to 140 grammes. The range of temperature in each experiment was 14° to 26° C. The rate of rise was observed with a mercury thermometer standardized by comparison with a platinum thermometer under the conditions of the experiment. The time of passing each division was recorded on an electric chronograph. The duration of an experiment varied from about 30 to 70 minutes. Special observations were made to determine the corrections for the heat supplied by stirring, and that lost by radiation, each of which amounted to about 10 per cent. of the heat-supply. The calorimeter was gilded, and completely surrounded by a nickel-plated steel enclosure, forming the bulb of a mercury thermo-regulator, immersed in a large water-bath, maintained at a constant temperature. In spite of the large corrections the results were extremely consistent, and the value of the temperature-coefficient of the diminution of the specific heat of water, deduced from the observed variation in the rate of rise at different points of the range 15° to 25° , agreed with the value subsequently deduced from Rowland's experiments over the same range, when his thermometers were reduced to the same scale. Griffiths' final result for the average value of the calorie over this range was 4.192 joules, taking the E.M.F. of the Clark cell at 15° C. to be 1.4342 volts. The difference from Rowland's value, 4.181, could be explained by supposing the E.M.F. of the Clark cells to have in reality been 1.4323 volts, or about 2 millivolts less than the value assumed. Griffiths has since applied the same method to the measurement of the specific heat of aniline, and the latent heat of vaporization of benzene and water.

§ 13. *Schuster and Gannon*.—The method employed by Schuster and Gannon for the determination of the specific heat of water in terms of the international electric units (*Phil. Trans. A*, 1895, p. 415) corresponded to the expression *ECT*, and differed in many essential details from that of Griffiths. The current through a platinum resistance of about 31 ohms in a calorimeter containing 1500 grammes of water was regulated so that the potential difference on its terminals was equal to that of twenty B.O.T. Clark cells in series. The duration of an experiment was about ten minutes, and the product of the mean current and the time, namely *CT*, was measured by the weight of silver deposited in a voltameter, which amounted to about 0.56 gramme. The uncertainty due to the correction for the water equivalent was minimized by making it small (about 27 grammes) in comparison with the water weight. The correction for external loss was reduced by employing a small rise of temperature (only 2.22°), and making the rate of heat-supply relatively rapid, nearly 24 watts. The platinum coil was insulated from the water by shellac varnish. The wire had a length of 760 cms., and the P.D. on its terminals was nearly 30 volts. The rate of stirring adopted was so slow that the heat generated by it could be neglected. The result found was 4.191 joules per calorie at 19° C. This agrees very well with Griffiths considering the difficulty of measuring so small a rise of temperature as 2° with a mercury thermometer. Admitting that the electro-chemical equivalent of silver increases with the age of the solution, a fact which has since been discovered, and that the E.M.F. of the Clark cell is probably less than 1.4340 volts (the value assumed by Schuster and Gannon), there is no difficulty in reconciling the result with that of Rowland.

§ 14. *Callendar and Barnes* (*Brit. Assoc. Reports*, 1897 and 1899) adopted an entirely different method of calorimetry, as well as a different method of electrical measurement. A steady current of liquid, *Q* grammes per second, of specific heat, *J*s joules per degree, flowing through a fine tube, 1 or 2 millims. in diameter, is heated by a steady electric current during its passage through the tube, and the difference of temperature $d\theta$ between the inflowing and the outflowing liquid is measured by a single reading with a delicate pair of differential platinum thermometers. The difference of potential *E* between the ends of the tube, and the electric current *C* through it, are measured on a very accurately calibrated potentiometer, in terms of a Clark cell and a standard resistance. If *hdθ* is the radiation loss in watts we have the equation,

$$EC = JsQd\theta + hd\theta \quad (2).$$

The advantage of this method is that all the conditions are steady, so that the observations can be pushed to the limit of accuracy and sensitiveness of the apparatus. The water equivalent of the calorimeter is immaterial, since there is no appreciable change of temperature. The heat-loss can be reduced to a minimum by enclosing the flow-tube in a hermetically sealed glass vacuum jacket. The insulation is the most perfect possible. No stirring is required, if the tube is sufficiently fine and the velocity of flow adequate. The conditions can be very easily varied through a wide range. The heat-loss *hdθ* is determined and eliminated by varying the flow of liquid and the

electric current simultaneously, in such a manner as to secure approximately the same rise of temperature for two or more widely different values of the flow of liquid. An example taken from the *Electrician*, September 1897, of one of the earliest experiments by this method on the specific heat of mercury will make the method clearer. The flow-tube was about 1 metre long and 1 millim. in diameter, coiled in a short spiral inside the vacuum jacket. The outside of the vacuum jacket was immersed in a water jacket at a steady temperature equal to that of the inflowing mercury.

Specific Heat of Mercury by continuous Electric Method.

Flow of Hg.	Rise of Temp.	Watts.	Heat-loss.	Specific Heat.
gm./sec.	$d\theta$	<i>EC</i>	<i>hdθ</i>	Per gm. deg.
8.753	11.764	14.862	0.655	.13780 joules
4.594	12.301	7.912	0.685	.03297 cal.

It is assumed as a first approximation that the heat-loss is proportional to the rise of temperature $d\theta$, provided that $d\theta$ is nearly the same in both cases, and that the distribution of temperature in the apparatus is the same for the same rise of temperature whatever the flow of liquid. The result calculated on these assumptions is given in the last column in joules, and also in calories at 20° C. The heat-loss in this example is large, nearly 4.5 per cent. of the total supply, owing to the small flow and the large rise of temperature, but this correction was greatly reduced in subsequent observations on the specific heat of water by the same method. In the case of mercury the liquid itself can be utilized to conduct the electric current. In the case of water or other liquids it is necessary to employ a platinum wire stretched along the tube as heating conductor. This introduces additional difficulties of construction, but does not otherwise affect the method. The absolute value of the specific heat deduced necessarily depends on the absolute values of the electrical standards employed in the investigation. But for the determination of relative values of specific heats in terms of a standard liquid, or of the variations of specific heat of a liquid, the method depends only on the constancy of the standards, which can be readily and accurately tested. The result found by this method for the specific heat of water at 20° C. would agree with that of Rowland within the probable limits of error, if the ohm were taken as correct, and the Clark cell at 15° C. were supposed to have an E.M.F. of 1.4333 volts. These values appear to be extremely probable in the light of recent researches, but the more important application of electrical methods to calorimetry is to the relative measurements for which it is peculiarly adapted.

§ 15. *Variation of Specific Heat of Water*.—The question of the variation of the specific heat of water has a peculiar interest and importance in connexion with the choice of a thermal unit. Many of the uncertainties in the reduction of older experiments, such as those of Regnault, arise from uncertainty in regard to the unit in terms of which they are expressed, which again depends on the scale of the particular thermometer employed in the investigation. The first experiments of any value were those of Regnault in 1847 on the specific heat of water between 110° C. and 192° C. They were conducted on a very large scale by the method of mixture, but showed discrepancies of the order of 0.5 per cent., and the calculated results in many cases do not agree with the data. This may be due merely to deficient explanation of details of tabulation. We may probably take the tabulated values as showing correctly the rate of variation between 110° and 190° C., but the values in terms of any particular thermal unit must remain uncertain to at least 0.5 per cent. owing to the uncertainties of the thermometry. Regnault himself adopted the formula,

$$s = 1 + 0.000,04t + 0.000,000,9t^2 \quad (\text{Regnault}), \quad (3)$$

for the specific heat *s* at any temperature *t* C. in terms of the specific heat at 0° C. taken as the standard. This formula has since been very generally applied over the whole range 0° to 200° C., but the experiments could not in reality give any information with regard to the specific heat at temperatures below 100° C. The linear formula proposed by Bosscha from an independent reduction of Regnault's experiments is probably within the limits of accuracy between 100° and 200° C., so far as the mean rate of variation is concerned, but the absolute values require reduction. It may be written—

$$s = s_{100} + .00023 (t - 100) \quad (\text{Bosscha-Regnault}) \quad (4).$$

The work of Pfaundler and Platter, of Hirn, of Jamin and Amaury, and of many other experimentalists who succeeded Regnault, appeared to indicate much larger rates of increase than he had found, but there can be little doubt that the discrepancies of their results, which often exceeded 5 per cent., were due to lack of appreciation of the difficulties of calorimetric measurements. The work of Rowland by the mechanical method was the first in which due attention was paid to the thermometry and to

the reduction of the results to the absolute scale of temperature. The agreement of his corrected results with those of Griffiths by a very different method, left very little doubt with regard to the rate of diminution of the specific heat of water at 20° C. The work of Bartoli and Stracciati by the method of mixture between 0° and 30° C., though their curve is otherwise similar to Rowland's, had appeared to indicate a minimum at 20° C., followed by a rapid rise. This lowering of the minimum was probably due to some constant errors inherent in their method of experiment. The more recent work of Lüdin, 1895, under the direction of Prof. Pernet, extended from 0° to 100° C., and appears to have attained as high a degree of excellence as it is possible to reach by the employment of mercury thermometers in conjunction with the method of mixture. His results, exhibited in Fig. 1, show a minimum at 25° C., and a maximum at 87° C., the values being .9935 and 1.0075 respectively in terms of the mean specific heat between 0° and 100° C. He paid great attention to the thermometry, and the discrepancies of individual measurements at any one point nowhere exceed 0.3 per cent., but he did not vary the conditions of the experiments materially, and it does not appear that the well-known constant errors of the method could have been completely eliminated by the methods which he adopted. The rapid rise from 25° to 75° may be due to radiation error from the hot water supply, and the subsequent fall of the curve to the inevitable loss of heat by evaporation of the boiling water on its way to the calorimeter. It must be observed, however, that there is another grave difficulty in the accurate determination of the specific heat of water near 100° C. by this method, namely, that the quantity actually observed is not the specific heat at the higher temperature, but the *mean specific heat* over the range 18° to 100°. The specific heat itself can be deduced only by differentiating the curve of observation, which greatly increases the uncertainty. The peculiar advantage of the electric method of Callendar and Barnes, already referred to, is that the specific heat itself is determined over a range of 8° to 10° at each point, by adding accurately measured quantities of heat to the water at the desired temperature in an isothermal enclosure, under perfectly steady conditions, without any possibility of evaporation or loss of heat in transference. These experiments, which have been extended by Barnes over the whole range 0° to 100°, agree very well with Rowland and Griffiths in the rate of variation at 20° C., but show a rather flat minimum of specific heat in the neighbourhood of 38° to 40° C. At higher points the rate of variation is very similar to that of Regnault's curve, but taking the specific heat at 20° as the standard of reference, the actual values are nearly 0.56 per cent. less than Regnault's. It appears probable that his values for higher temperatures may be adopted with this reduction, which is further confirmed by the results of Reynolds and Moorby, and by those of Lüdin. According to the electric method, the whole range of variation of the specific heat between 10° and 80° is only 0.5 per cent. Comparatively simple formulæ, therefore, suffice for its expression to 1 in 10,000, which is beyond the limits of accuracy of the observations. It is more convenient in practice to use a few simple formulæ, than to attempt to represent the whole range by a single complicated expression:—

Below 20° C. $s = 0.9982 + 0.000,0045 (t - 40)^2 - 0.000,0005 (t - 20)^3$.
From 20° to 60°, $s = 0.9982 + 0.000,0045 (t - 40)^2$ (5).

Above 60° to 200° $s = 0.9944 + .000,04t + 0.000,0009 t^2$ (Reg. corr'd.)
 $\{s = 1.000 + 0.000,22 (t - 60), \text{ (Bosscha corr'd.)}$

The addition of the cubic term below 20° is intended to represent the somewhat more rapid change near the freezing-point. This effect is probably due, as suggested by Rowland, to the presence of a certain proportion of ice molecules in the liquid, which is also no doubt the cause of the anomalous expansion. Above 60° C. Regnault's formula is adopted, the absolute values being simply diminished by a constant quantity 0.0056 to allow for the probable errors of his thermometry. Above 100° C., and for approximate work generally, the simpler formula of Bosscha, similarly corrected, is probably adequate.

The following table of values, calculated from these formulæ, is taken from the *Brit. Assoc. Report*, 1899, with a slight modification to allow for the increase in the specific heat below 20° C. This was estimated in 1899 as being equivalent to the addition of the constant quantity 0.020 to the values of the total heat h of the liquid as reckoned by the parabolic formula (5). This quantity is now, as the result of further experiments, added to the values of h , and also represented in the formula for the specific heat itself by the cubic term.

The unit of comparison in the following table is taken as the specific heat of water at 20° C. for the reasons given below. This unit is taken as being 4.180 joules per gramme-degree-Centigrade on the scale of the platinum thermometer, corrected to the absolute scale as explained in the article THERMOMETRY, § 23, which has been shown to be practically equivalent to the hydrogen scale. The value 4.180 joules at 20° C. is the mean

Specific Heat of Water in terms of Unit at 20° C. 4.180 Joules.

t° C.	Joules.	s.	h.	Rowland.
0°	4.208	1.0094	0	0
5°	4.202	1.0054	5.037	5.037
10°	4.191	1.0027	10.056	10.058
15°	4.184	1.0011	15.065	15.068
20°	4.180	1.0000	20.068	20.071
25°	4.177	0.9992	25.065	25.067
30°	4.175	0.9987	30.060	30.057
35°	4.173	0.9983	35.052	35.053
40°	4.173	0.9982	40.044	
50°	4.175	0.9987	50.028	
60°	4.180	1.0000	60.020	
70°	4.187	1.0016	70.028	
80°	4.194	1.0033	80.052	
90°	4.202	1.0053	90.095	Shaw
100°	4.211	1.0074	100.158	Regnault
120°	4.231	1.0121	120.35	120.73
140°	4.254	1.0176	140.65	140.88
160°	4.280	1.0238	161.07	161.20
180°	4.309	1.0308	181.62	182.14
200°	4.341	1.0384	202.33	
220°	4.376	1.0467	223.20	

between Rowland's corrected result 4.181 and the value 4.179, deduced from the experiments of Reynolds and Moorby on the assumption that the ratio of the mean specific heat 0° to 100° to that at 20° is 1.0016, as given by the formulæ representing the results of Callendar and Barnes. This would indicate that Rowland's corrected values should, if anything, be lowered. In any case the value of the mechanical equivalent is uncertain to at least 1 in 2000.

The mean specific heat, over any range of temperature, may be obtained by integrating the formulæ between the limits required, or by taking the difference of the corresponding values of the total heat h , and dividing by the range of temperature. The quantity actually observed by Rowland was the total heat. It may be remarked that starting from the same value at 5°, for the sake of comparison, Rowland's values of the total heat agree to 1 in 5000 with those calculated from the formulæ. The values of the total heat observed by Regnault, as reduced by Shaw, also show a very fair agreement, considering the uncertainty of the units. It must be admitted that it is desirable to redetermine the variation of the specific heat above 100° C. This is very difficult on account of the steam-pressure, and could not easily be accomplished by the electrical method. The writer has, however, devised a continuous method of mixture, which appears to be peculiarly adapted to the purpose, and promises to give more certain results. In any case it may be remarked that formulæ such as those of Jamin, Henrichsen, Baumgartner, Winkelmann, or Dieterici, which give far more rapid rates of increase than that of Regnault, cannot possibly be reconciled with his observations, or with those of Reynolds and Moorby, or Callendar and Barnes, and are certainly inapplicable above 100° C.

§ 16. *On the Choice of the Thermal Unit.*—So much uncertainty still prevails on this fundamental point that it cannot be passed over without reference. There are three possible kinds of unit, depending on the three fundamental methods already given: (1) The thermometric unit, or the thermal capacity of unit mass of a standard substance under given conditions of temperature and pressure on the scale of a standard thermometer. (2) The latent-heat unit, or the quantity of heat required to melt or vaporize unit mass of a standard substance under given conditions. This unit has the advantage of being independent of thermometry, but the applicability of these methods is limited to special cases, and the relation of the units to other units is difficult to determine. (3) The absolute or mechanical unit, the quantity of heat equivalent to a given quantity of mechanical or electrical energy. This can be very accurately realized, but is not so convenient as (1) for ordinary purposes.

In any case it is necessary to define a thermometric unit of class (1). The standard substance must be a liquid. Water is always selected, although some less volatile liquid, such as aniline or mercury, would possess many advantages. With regard to the scale of temperature, there is very general agreement that the absolute scale as realized by the hydrogen or helium thermometer should be adopted as the ultimate standard of reference. But as the hydrogen thermometer is not directly available for

the majority of experiments, it is necessary to use a secondary standard for the practical definition of the unit. The electrical resistance thermometer of platinum presents very great advantages for this purpose over the mercury thermometer in point of reproducibility, accuracy, and adaptability to the practical conditions of experiment. The conditions of use of a mercury thermometer in a calorimetric experiment are necessarily different from those under which its corrections are determined, and this difference must inevitably give rise to constant errors in practical work. The primary consideration in the definition of a unit is to select that method which permits the highest order of accuracy in comparison and verification. For this reason the definition of the thermal unit will in the end probably be referred to a scale of temperature defined in terms of a standard platinum thermometer.

There is more diversity of opinion with regard to the question of the standard temperature. Many authors, adopting Regnault's formula, have selected 0°C . as the standard temperature, but this cannot be practically realized in the case of water, and his formula is certainly erroneous at low temperatures. A favourite temperature to select is 4°C ., the temperature of maximum density, since at this point the specific heat at constant volume is the same as that at constant pressure. But this is really of no consequence, since the specific heat at constant volume cannot be practically realized. The specific heat at 4° could be accurately determined as the mean over the range 0° to 8° keeping the jacket at 0°C . But the change appears to be rather rapid near 0° , the temperature is inconveniently low for ordinary calorimetric work, and the unit at 4° would be so much larger than the specific heat at ordinary temperatures that nearly all experiments would require reduction. The natural point to select would be that of minimum specific heat, but if this occurs at 40°C . it would be inconveniently high for practical realization except by the continuous electrical method. It was proposed by a committee of the British Association to select the temperature at which the specific heat was 4·200 joules, leaving the exact temperature to be subsequently determined. It was supposed at the time, from the original reduction of Rowland's experiments, that this would be nearly at 10°C ., but it now appears that it may be as low as 5°C ., which would be inconvenient. This is really only an absolute unit in disguise, and evades the essential point, which is the selection of a standard temperature for the water thermometric unit. A similar objection applies to selecting the temperature at which the specific heat is equal to its mean value between 0° and 100° . The mean calorie cannot be accurately realized in practice in any simple manner, and is therefore unsuitable as a standard of comparison. Its relation to the calorie at any given temperature, such as 15° or 20° , cannot be determined with the same degree of accuracy as the ratio of the specific heat at 15° to that at 20° , if the scale of temperature is given. The most practical unit is the calorie at 15° or 20° or some temperature in the range of ordinary practice. The temperature most generally favoured is 15° , but 20° would be more suitable for accurate work. These units differ only by 11 parts in 10,000 according to Callendar and Barnes, or by 13 in 10,000 according to Rowland and Griffiths, so that the difference between them is of no great importance for ordinary purposes. But for purposes of definition it would be necessary to take the mean value of the specific heat over a given range of temperature, preferably at least 10° , rather than the specific heat at a point which necessitates reference to some formula of reduction for the rate of variation. The specific heat at 15° would be determined with reference to the mean over the range 10° to 20° , and that at 20° from the range 15° to 25° . There can be no doubt that the range 10° to 20° is too low for the accurate thermal regulation of the conditions of the experiment. The range 15° to 25° would be much more convenient from this point of view, and a mean temperature of 20° is probably nearest the average of accurate calorimetric work. For instance 20° is the mean of the range of the experiments of Griffiths and of Rowland, and is close to that of Schuster and Gannon. It is readily attainable at any time in a modern laboratory with adequate heating arrangements, and is probably on the whole the most suitable temperature to select.

§ 17. *Specific Heat of Gases*.—In the case of solids and liquids under ordinary conditions of pressure, the external work of expansion is so small that it may generally be neglected; but with gases or vapours, or with liquids near the critical point, the external work becomes so large that it is essential to specify the conditions under which the specific heat is measured. The most important cases are, the specific heats (1) at constant volume; (2) at constant pressure; (3) at saturation pressure in the case of a liquid or vapour. In consequence of the small thermal capacity of gases and vapours per unit volume

at ordinary pressures, the difficulties of direct measurement are almost insuperable except in case (2). Thus the direct experimental evidence is somewhat meagre and conflicting, but the question of the relation of the specific heats of gases is one of great interest in connexion with the kinetic theory and the constitution of the molecule. The well-known experiments of Regnault and Wiedemann on the specific heat of gases at constant pressure agree in showing that the *molecular specific heat*, or the thermal capacity of the molecular weight in grammes, is approximately independent of the temperature and pressure in case of the more stable diatomic gases, such as H_2 , O_2 , N_2 , CO , &c., and has nearly the same value for each gas. They also indicate that it is much larger, and increases considerably with rise of temperature, in the case of more condensible vapours, such as Cl_2 , Br_2 , or more complicated molecules, such as CO_2 , N_2O , NH_3 , C_2H_4 . The direct determination of the specific heat at constant volume is extremely difficult, but has been successfully attempted by Joly with his steam calorimeter, in the case of air and CO_2 . Employing pressures between 7 and 27 atmospheres, he found that the specific heat of air between 10° and 100°C . increased very slightly with increase of density, but that of CO_2 increased nearly 3 per cent. between 7 and 21 atmospheres. The following formulæ represent his results for the specific heat s at constant volume in terms of the density d in gms. per c.c.:—

$$\begin{aligned}\text{Air, } s &= 0.1715 + 0.028d, \\ \text{CO}_2, s &= 0.165 + 0.213d + 0.34d^2.\end{aligned}$$

§ 18. *Ratio of Specific Heats*.—According to the elementary kinetic theory of an ideal gas, the molecules of which are so small and so far apart that their mutual actions may be neglected, the kinetic energy of translation of the molecules is proportional to the absolute temperature, and is equal to $3/2$ of p_v , the product of the pressure and the volume, per unit mass. The expansion per degree at constant pressure is $v/\theta = R/p$. The external work of expansion per degree is equal to R , being the product of the pressure and the expansion, and represents the difference of the specific heats $S - s$, at constant pressure and volume, assuming as above that the internal work of expansion is negligible. If the molecules are supposed to be like smooth, hard, elastic spheres, incapable of receiving any other kind of energy except that of translation, the specific heat at constant volume would be the increase per degree of the kinetic energy, namely $3pv/2\theta = 3R/2$, that at constant pressure would be $5R/2$, and the ratio of the specific heats would be $5/3$ or 1.666. This appears to be actually the case for monatomic gases such as mercury vapour (Kundt and Warburg, 1876), argon and helium (Ramsay, 1896). For diatomic or compound gases Maxwell supposed that the molecule would also possess energy of rotation, and endeavoured to prove that in this case the energy would be equally divided between the six degrees of freedom, three of translation and three of rotation, if the molecule were regarded as a rigid body incapable of vibration-energy. In this case we should have $s = 3R$, $S = 4R$, $S/s = 4/3 = 1.333$. In 1879 Maxwell considered it one of the greatest difficulties which the kinetic theory had yet encountered, that in spite of the many other degrees of freedom of vibration revealed by the spectroscope, the experimental value of the ratio S/s was 1.40 for so many gases, instead of being less than $4/3$. Somewhat later Boltzmann suggested that a diatomic molecule, regarded as a rigid dumb-bell or figure of rotation, might have only five effective degrees of freedom, since the energy of rotation about the axis of symmetry could not be altered by collisions between the molecules. The theoretical value of the ratio S/s in this case would be the required $7/5$. For a rigid molecule on this theory the smallest value possible would be $4/3$. Since much smaller values are found for more complex molecules, we may suppose that, in these cases, relative movements of the constituent atoms are possible, which may be classed generally as energy of vibration. A hypothesis doubtfully attributed to Maxwell is that each additional atom in the molecule is equivalent to two extra degrees of freedom. From an m -atomic molecule we should then have $S/s = 1 + 2/(2m + 1)$. This gives a series of ratios $5/3$, $7/5$, $9/7$, $11/9$, &c., for 1, 2, 3, 4, &c., atoms in the molecule, values which fall within the limits of experimental error in many cases. It is not at all clear, however, that energy of vibration should bear a constant ratio to that of translation, although this would probably be the case for rotation. For the simpler gases, which are highly diathermanous and

radiate badly even at high temperatures, the energy of vibration is probably very small, except under the special conditions which produce luminosity in flames and electric discharges. For such gases, assuming a constant ratio of rotation to translation, the specific heat at low pressures would be very nearly constant. For more complex molecules the radiative and absorptive powers are known to be much greater. The energy of vibration may be appreciable at ordinary temperatures, and would probably increase more rapidly than that of translation with rise of temperature, especially near a point of dissociation. This would account for an increase of S , and a diminution of the ratio S/s , with rise of temperature which apparently occurs in many vapours. The experimental evidence, however, is somewhat conflicting, and further investigations are very desirable on the variation of specific heat with temperature. Given the specific heat as a function of the temperature, its variation with pressure may be determined from the characteristic equation of the gas, as illustrated for a simple case in the article THERMODYNAMICS, § 15. The direct methods of measuring the ratio S/s , by the velocity of sound and by adiabatic expansion, are sufficiently described in many text-books.

§ 19. *Atomic and Molecular Heats.*—The ideal atomic heat is the thermal capacity of a gramme-atom in the ideal state of monatomic gas at constant volume. This would be nearly three calories. For a diatomic gas, the molecular heat would be nearly five calories, or the atomic heat of a gas in the diatomic state would be 2.5. Estimated at constant pressure the atomic heat would be 3.5. Some authors adopt 2.5 and some 3.5 for the ideal atomic heat. The atomic heat of a metal in the solid state is in most cases larger than six calories at ordinary temperatures. Considering the wide variations in the physical condition and melting-points, the close agreement of the atomic heats at any one temperature is very remarkable. The specific heats as a rule increase with rise of temperature, in some cases, e.g., iron and nickel, very rapidly. According to Tilden (*Phil. Trans.*, 1900), the atomic heats of pure nickel and cobalt, as determined from experiments at the boiling-points of O_2 and CO_2 , diminish so rapidly at temperatures below $0^\circ C.$ as to suggest that they would reach the value 2.42 at the absolute zero. This is the value of the minimum of atomic heat calculated by Perry from diatomic hydrogen, but the observations themselves might be equally well represented by taking the imaginary limit 3, since the quantity actually observed is the mean specific heat between 0° and $-182.5^\circ C.$ Subsequent experiments on other metals at low temperatures did not indicate a similar diminution of specific heat, so that it may be doubted whether the atomic heats really approach the ideal value at the absolute zero. No doubt there must be approximate relations between the atomic and molecular heats of similar elements and compounds, but considering the great variations of specific heat with temperature and physical state, in alloys, mixtures, or solutions, and in allotropic or other modifications, it would be idle to expect that the specific heat of a compound could be deduced by any simple additive process from that of its constituents.

Caltagirone, a town and bishop's see of the province of Catania, Sicily, Italy, 57 miles S.W. from Catania. Besides the cathedral, it has a technical school, school of agriculture, and several fine mansions. Population, about 33,000.

Caltanissetta, Italian town and episcopal see and capital of the province of Caltanissetta, Sicily, 43 miles by rail N.E. from Girgenti. It has a diocesan seminary, a royal school of mines, and a technical school. Population of town (1881), 30,480; (1901), 44,600; of province (1881), 266,379; (1901), 330,972.

Caluire et Cuire, a town of France, department of Rhône, in the arrondissement of Lyons, $7\frac{1}{2}$ miles N. by E. of that city, on railway from Lyons to Trevaux. It has manufactures of coarse earthenware and hardware; copper- and bronze-founding, and essence distilleries. Population (1881), 6828; (1896), 8070, (comm.) 9035; (1901), 10,926.

Calumpit, a town of 15,000 inhabitants in the

province of Bulacan, Luzon, Philippine Islands, at the junction of the Quingua river with the Rio Grande de la Pampanga. The surrounding country is a fertile plain, producing large quantities of rice, as well as sugar, indigo, and a variety of fruits. The Manila-Dagupan railway passes through, and the bridge across the Rio Grande is the longest in the Philippines. The town was fired and completely burned by insurgent troops in 1899. The language is Tagalog.

Calvados, a department of the N. of France, bordering on the English Channel, watered by the Orne and Vire.

Area, 2198 square miles, distributed among 38 cantons and 763 communes. The population decreased to 437,267 in 1886 and 410,178 in 1901, a reduction due to the fact that the number of births is in steady decline and much surpassed by the number of deaths. In 1899 the deaths numbered 9966 against 8520 births, of which 968 were illegitimate; marriages numbered 3009. Caen, the capital, had in 1896, 45,000 inhabitants. In 1896 there were 1055 primary schools with 55,000 pupils, and the illiterate formed 2 per cent. of the population. Calvados is chiefly noted for its rearing of live stock, an industry favoured by the excellence of its pastures. Out of 1,460,498 acres forming in 1896 the total area cultivated, 617,786 acres were laid out in grass and 590,600 acres were plough-land. In 1899 the wheat crop yielded the value of £1,015,000. The total production of the green crop (trefoil, lucerne, and sainfoin) and natural pastures and grass lands amounted to 11,510,000 cwts., of the value of £1,498,000. In the way of grass lands Calvados ranked third among the departments of France. Colza, which was produced to the amount of fully a fourth of the total produce of France, returned a value of £230,000. Among the fruits cultivated, apples for cider gave a revenue estimated at £444,000. The live stock in 1899 included 65,000 horses, 236,614 cattle, and 68,750 pigs, and the value of milk products was £1,839,140. The horses of Calvados are much prized. Agriculture constitutes the principal wealth of this department, which supplies large quantities of butter (Isigny) and of cheese. It has, however, also a few coal-mines and seams of iron, the latter supplying 13,000 metric tons in 1898. The department produces plenty of stone. The textile industry has developed around Caen and Falaise.

Calverley, Charles Stuart (1831-1884), one of the brightest of English wits, and the literary father of what may be called the university school of humour, was born at Martley in Worcestershire, 22nd December 1831. His father, the Rev. Henry Blayds, resumed in 1852 the old family name of Calverley, which his grandfather had exchanged for Blayds in 1807. It was as Charles Stuart Blayds that most of the son's university distinctions were attained. He went up to Balliol from Harrow in 1850, and was soon known in Oxford as the most daring and most high-spirited undergraduate of his time. He was a universal favourite, a delightful companion, a brilliant scholar, and the playful enemy of all "dons." In 1851 he won the Chancellor's prize for Latin verse, and it is said that the entire exercise was written in an afternoon, when his friends had locked him into his rooms, declining to let him out till he had finished what they were confident would prove the prize poem. A year later he took his name off the books, to avoid the consequences of a college escapade, and migrated to Christ's College, Cambridge. Here he was again successful in Latin verse, and remains the unique example of an undergraduate who has won the Chancellor's prize at both universities. In 1856 he took second place in the first class in the Classical Tripos. He was elected fellow of Christ's (1858), published *Verses and Translations* in 1862, married a cousin, and was called to the bar in 1865. Owing to an accident while skating he was prevented from following up a professional career, and during the last years of his life he was an invalid. His *Translations into English and Latin* appeared in 1866; his *Theocritus translated into English Verse* in 1869; *Fly Leaves* in 1872; and *Literary Remains* in 1885. He died on the 17th February 1884. Calverley

was one of the most brilliant men of his day; and, had he enjoyed health, might have achieved distinction in any career he chose. Constitutionally indolent, he was endowed with singular gifts in every department of culture; he was a scholar, a musician, an athlete, and a brilliant talker. What is left us marks only a small portion of his talent, but his sparkling, dancing verses, which have had many clever imitators, are still without a rival in their own line. His humour was illumined by good nature; his satire was keen but kind; his laughter was of that human sort which is often on the verge of tears. Imbued with the classical spirit, he introduced into the making of light verse the polish and elegance of the great masters, and even in its most whimsical mood his verse is raised to the level of poetry by the saving excellence of style. (A. W.A.)

Calvo, Carlos (1824-1893), Argentine publicist and historian, was born at Buenos Ayres on 26th February 1824, and devoted himself to the study of the law. In 1860 he was sent by the Paraguayan Government on a special mission to London and Paris. Remaining in France, he published in 1863 his *Derecho internacional teórico y práctico de Europa y América*, in two volumes, and at the same time brought out a French version. The book immediately took rank as one of the highest modern authorities on the subject, and by 1887 the first French edition had become enlarged to six volumes. Señor Calvo's next publications were of a semi-historical character. Between 1862 and 1869 he published in Spanish and French his great collection in fifteen volumes of the treaties and other diplomatic acts of the South American republics, and between 1864 and 1875 his *Annales historiques de la révolution de l'Amérique latine*, in five volumes. In 1884 he was one of the founders at the Ghent Congress of the Institut de droit international. In the following year he was Argentine minister at Berlin, and published his *Dictionnaire du droit international public et privé* in that city. Calvo died on 4th May 1893.

Camacho, Juan Francisco (1824-1896), Spanish statesman and financier, was born in Cadiz in 1824. The first part of his life was devoted to mercantile and financial pursuits at Cadiz, and then in Madrid, where he managed the affairs of and liquidated a mercantile and industrial society to the satisfaction and profit of the shareholders. In 1837 he became a captain in the national militia, in 1852 Conservative deputy in the Cortes for Alcoy, in 1853 secretary of congress, and was afterwards elected ten times deputy, twice senator, and life senator in 1877. Camacho took a prominent part in all financial debates and committees, was offered a seat in the Mon cabinet of 1864, and was appointed under-secretary of state finances in 1866 under Canovas and O'Donnell. After the revolution of 1868 he declined the post of minister of finance offered by Marshal Serrano, but served in that capacity in 1872 and 1874 in Sagasta's cabinets. When the restoration took place, Camacho sat in the Cortes among the dynastic Liberals with Sagasta as leader, and became finance minister in 1881 at a critical moment when Spain had to convert, reduce, and consolidate her treasury and other debts with a view to resuming payment of coupons. Camacho drew up an excellent budget and collected taxation with a decidedly unpopular vigour. A few years later Sagasta again made him finance minister under the regency of Queen Christina, but had to sacrifice him when public opinion very clearly pronounced against his too radical financial reforms and his severity in collection of taxes. He was for the same reasons unsuccessful as a governor of the Tobacco Monopoly Company. He

then seceded from the Liberals, and during the last years of his life he affected to vote with the Conservatives, who made him governor of the Bank of Spain. He died in Madrid on 23rd January 1896. (A. E. H.)

Camajore, a town of the province of Lucca, Tuscany, Italy, at the foot of the Apuan Alps, 12 miles N.W. from Lucca. It is still surrounded by walls, and has a 13th-century church and an old triumphal arch. Population, about 9000.

Cambay (KHAMBHAT), a native state of India, within the Gujarat division of Bombay. It has an area of 350 square miles. Population (1891), 89,722; (1901), 75,122, showing a decrease of 16 per cent. due to the famine of 1899-1900. The estimated gross revenue was Rs.6,18,139; the tribute, Rs.21,924; the number of police was 170; the number of schools in 1897-98 was 36, with 2490 pupils, being 3.43 per cent. of the population, compared with 2.4 for Bombay generally.

The town of CAMBAY had a population in 1881 of 36,007, and in 1891 of 31,390; the municipal income in 1897-98 was Rs.10,229, together with Rs.5,596 contributed by the state. It is proposed to connect the town by railway with the terminus of the Gaekwar's railway at Petlad, 19 miles distant, at a cost to the state of Rs.10,00,000. There is a high school and a state printing-press, which issues a monthly gazette.

Cambodia, called by the inhabitants *Sroekhmer* (Khmer province), lies between 10° 30' and 13° 46' N. lat., and 102° 50' and 106° 50' E. long. It is bounded on the W. and N. by Siam and the Laos States, on the E. and S. by Cochin-China, and on the S.W. by the Gulf of Siam. By the treaty of 3rd October 1893, between France and Siam, the latter bound herself not to maintain armed forces upon the great lake or in the adjoining provinces of Battambang and Siemrap. The whole of Cambodia lies in the lower Mekong valley, the delta of which commences at Pnom-penh. The characteristic feature of Cambodian geography is the presence of an immense lake, Tonle-Sap, in a vast depression more than 68 miles long and 15 miles wide. During the annual overflow of the Mekong (when its waters rise to a height of 40-45 feet and flow violently towards the lake along a channel 62 miles long and 1640-4920 feet wide) this lake covers an area of about 770 square miles, but during the dry season the current reverses and the depression empties, so that the lake shrinks to an area of 100 square miles and its depth falls from 45-48 feet to 1½ and 5 feet in its shallowest parts. Tonle-Sap represents, in all probability, the chief wealth of Cambodia. It supports a fishing population of over 30,000, and provides a variable but always considerable quantity of dried fish and *nuoc-mam* (sauce composed of fermented fish) for exportation. The climate is hot and damp. Cotton and cotton-wool reach perfection. Cotton in the pod finds its chief market at Kobe (Japan) at an average rate of 20 piastres the picul of 150 lb. The area of Cambodia is about 38,600 square miles. Its population numbers about 1,500,000, of whom 208 are French (exclusive of the land and sea forces, which, however, are small, the defence of Cambodia being assured by Indo-China), 200,000 Annamese, and 1,300,000 Cambodians of Khmer origin. Cambodia became a French protectorate by the treaty with France of 11th August 1863, and the convention of 17th June 1884. It is an absolute monarchy, and its king (by divine right) bears a very long series of laudatory titles. As in all countries the inhabitants of which have a Khmer origin, there are in Cambodia two kings, the second being a general, the younger brother of the first king and his heir-presumptive. King Norodom was born in 1834, crowned in

1860 at Udong, and the same year made Pnom-penh his capital. He has 14 sons and 22 daughters. The second king, *obbarach*, Prince Somdach Prea Maha, has 13 sons and 9 daughters. Since 1884 a French resident has lived near the king. In 1885 an insurrection, due to increased taxation, was utilized by the king's brother, Si-Votha, who claimed to have been despoiled of the crown, but was promptly suppressed. In 1891 M. de Lanessan, governor-general, concluded an agreement with King Norodom by which the Cambodian budget was to be combined with the general one of the protectorate. This budget was established from 1st January 1892, and immediately sent up the value by 500,000 piastres in a budget which in the previous period rose only to a total value of 800,000 piastres. The income and expenditure in 1899 practically balanced at 3,146,359 piastres. On the unification of Indo-China, Cambodia was represented on the Superior Council. On 16th August 1899 a Council of the Protectorate was instituted. The Superior Council of Indo-China sat at Pnom-penh in October 1899, the two kings being present. Cambodia is divided into seven districts, subdivided into numerous provinces administered by mandarins subject to the resident-general and vice-residents. Cambodian idiom has nothing in common with that of Annam. It is monosyllabic in character, a blend of Malayan and Chinese. The "king's language" and the royal writing, however, are apparently of Aryan origin and akin to *Pali*. Cambodian writing is syllabic. The books (manuscripts) are generally formed of palm-leaves upon which the characters are traced by means of a style. The gambling monopoly was condemned in 1887, and suppressed in consequence of the financial agreement of 1st January 1893. PNOM-PENH, the capital, is a town of about 45,000 people, 173 miles from the sea, on the branch of the Mekong which communicates with Tonle-Sap. It is a commercial centre of great importance. During low water the largest vessels can ascend the Mekong and drop anchor within a mile of the town. During the rest of the year they come alongside the quay below the town, in the arm of the lake. House-building is changing the appearance of the town, which has grown rapidly, new quays and numerous streets having been built. (See also INDO-CHINA.) (J. M. A. DE L.)

Camborne, a market town and railway station in the Camborne parliamentary division of Cornwall, England, 14 miles N.W. of Falmouth. Recent erections are a free library and mining, science and art schools; practical mining is now taught in South Condurrow mine. Area of civil parish (an urban district), 6931 acres; population (1881), 13,601; (1901), 14,737.

Cambrai, chief town of arrondissement, department of Nord, France, 37 miles S.E. of Lille, and an important junction on railway from Paris to Lille. Great improvements have been effected in the city. The fosses have been filled up and the ramparts in part levelled to make way, as the suburbs extended, for wide avenues stretching out on all sides. A new railway station has been constructed. Chicory is now manufactured very extensively, and one of the sugar factories is said to be the largest in the world. During the busy season 2000 persons are employed, during the rest of the year from 300 to 400. The consumption of beetroot amounts to from 200,000 to 250,000 tons annually. Port traffic on the Mons and Seine canal was 149,422 tons in 1899. Population (1881), 14,818; (1896), 14,306, (comm.) 21,948; (1901), 26,586.

Cambridge, a market and university town of England, capital of the county of Cambridge, stands on the river Cam, a tributary of the Ouse, 56 miles by rail N. by

E. from London. Since the year 1876 several new colleges and hostels have been opened.

Cavendish College, which was founded in 1873 for the purpose of affording a cheaper course to students somewhat younger than the average of the older colleges, was declared a public hostel of the university in 1882, but was closed in 1891. The buildings, situated in Hills Road, were acquired by the authorities of Homerton College, Middlesex (founded in 1843), and under the name of *Homerton New College* equipped as an undenominational training college for schoolmistresses. *Selwyn College* was incorporated in 1882, and recognized as a public hostel in 1883, though the two blocks of the existing buildings, in Grange Road, were not erected until 1889; the chapel in 1895. The style is Tudor, from designs by Sir A. W. Blomfield. It is intended to afford a cheaper course to students belonging to the Church of England. *Ayerst Hall*, opened as a public hostel on Parker's Piece in 1884, was removed in 1893 to a new structure, in the Queen Anne style, on Mount Pleasant, and closed in 1896. It is now the Roman Catholic St Edmund's Hostel. *Girton College*, which was first opened at Hitchin in 1869, was removed to its present site, $2\frac{1}{2}$ miles from Cambridge, on the Huntingdon Road, in 1873. It consists of plain red-brick structures. Additions were made in 1876 and 1883, and subscriptions were collected in 1901 for further enlarging it. *Newnham College* for women was founded in 1871. The buildings, which were added to in 1887 and 1893, consist of three halls, built from designs by Basil Champneys, and a library, added in 1898. *Ridley Hall*, at Newnham, was erected in 1879-82 as a training college for evangelical candidates for the ministry of the Church of England. New buildings, including the chapel, were added in 1892. *Westminster College*, the theological training college of the Presbyterian Church of England, was opened in 1899. The buildings are of brick, in the Jacobean style, and stand on the Madingley Road.

The following colleges, situated in parts of England other than Cambridge, have been duly affiliated to the university—University College, Nottingham; St David's College, Lampeter, Wales; Firth College, Sheffield; University College of Wales, Aberystwith; St Edmund's College, Old Hall, Ware; as also the Universities of New Zealand (1886), Adelaide (1891), Cape of Good Hope (1892), Allahabad (1895), Bombay (1896), Punjab (1896), Toronto (1896), Madras (1897), Sydney (1898), Montreal (1899), and Tasmania (1900).

Besides these, various additions have been made to the older colleges. A new east wing, of red Suffolk brick and Ancaster stone, was added to Jesus College in 1883-84; new buildings were added to Pembroke, from designs by G. G. Scott, Jun., in 1883; new rooms to St John's in 1887-88; a new hostel to Emmanuel in 1886 and 1894; new buildings (1887) and a chapel (1891) to Queens'; and a third court, from designs by J. L. Pearson, to Sidney Sussex; while St Catherine's Chapel was thoroughly restored in 1896. Amongst the new scientific equipments of the university may be mentioned the museum of archaeology (1884), divided into two departments—one classical, the other general; it also contains the museum of the Cambridge Antiquarian Society. The new geological museum was erected in 1900-1901, and the Divinity School, a 15th-century Gothic structure, built from Basil Champneys' designs in 1878-79, out of the Selwyn fund, contains Bishop Lightfoot's library. A chemical laboratory (1887), new anatomical lecture-rooms, dissecting-rooms, and anatomical museum should also be mentioned. The university library was enlarged in 1889. The Fitzwilliam Museum has been

enriched by several valuable bequests of pictures, &c., since 1872, and now contains also valuable collections of engravings and etchings. In 1891 Mr Newall of Gateshead presented to the astronomical observatory a new equatorial telescope of 29 feet focal length and 25 inches' aperture. Addenbroke's Hospital was enlarged in 1878 and 1883, and now has over 150 beds. In the end of 1900 the university was attended by 2985 students, and the professorial staff numbered 88. The income of the university increased from £21,629 in 1879 to £45,614 in 1899. (For the history of the university, see under UNIVERSITIES.)

Turning to the town edifices, there has been considerable activity in church building and church restoration. To the former category belong St Barnabas' (1878-80), Early English, enlarged in 1887-90; St John's (begun in 1896); St Philip's (1890); the Roman Catholic Church of Our Lady (1887-90), Early Decorated, with a tower 220 feet high; and the Presbyterian church (1890-91). Amongst churches that have undergone restoration are St Mary's (1874-92); St Benet's (1874-82); St Botolph's (1874-87); St Giles's (rebuilt in 1875-76), of white brick in the Early French Gothic; and St Mary's the Less (1891). Baptists, Congregationalists, Wesleyans, Primitive Methodists, Quakers, and Salvation Army all have places of worship in the town. A free library was built in 1885, and a branch library on Mill Road in 1897; the Teachers' Training College, Wollaston Road, 1895; the Henry Martyn Memorial Hall in 1887; the Cambridge Technical Institute in 1894; the Working Men's Institute in 1884; the Beaconsfield (Working Men's) Club in 1884; the police station in 1901; the Theatre Royal in 1896; a hospital for infectious diseases in 1884; and a cattle market in 1885. In 1889-90 new buildings were erected for the Perse grammar school in Hills Road, and in 1893 a science building for Leys school. The principal industries are iron and brass foundries, brick and tile works, tobacco factories, breweries, maltings, flour mills, and nursery gardens. The town is governed by a mayor, 10 aldermen, and 30 councillors representing the town, and 2 aldermen and 6 councillors representing the university. Population (1891), the census being taken during vacation, of municipal borough (area, 3233 acres), 36,983; (1901), 38,393; of parliamentary borough (area, 3975 acres) (1891), 44,330; (1901), 47,737.

Cambridge, a town of Maryland, U.S.A., capital of Dorchester county, on the south bank of the Choptank river, on the eastern side of Chesapeake Bay, at the terminus of a branch of the Philadelphia, Wilmington, and Baltimore railway. Population (1890), 4192; (1900), 5747, of whom 52 were foreign-born and 1958 were negroes.

Cambridge, capital of Middlesex county, Massachusetts, U.S.A. Its area of 7 square miles formerly contained several villages, the chief of which were Old Cambridge, the seat of Harvard University, East Cambridge, and Cambridgeport, the last two being manufacturing and commercial centres. At present the entire area is built up, mainly in detached residences, and the city, although under independent government, is in effect a part of Boston, with which it is connected by several bridges and tramways. It has an excellent water-supply, and the waterworks, which belong to the city, cost more than \$5,000,000. Although in the main residential, it

has extensive manufactures. In 1890 the manufacturing capital was \$20,331,585, employing 14,258 persons, with an output valued at \$35,975,000. The principal items of production were iron and steel goods, furniture, soap, and candles, musical instruments and crackers. Cambridge is one of the chief publishing centres, containing nine publishing houses, with a capital of \$1,600,000. The assessed valuation of property in 1900 was \$94,465,930, or over \$1000 per caput of the population, the net debt was \$6,090,707, and the rate of taxation \$16.90 per \$1000. The receipts from all sources, including loans, were \$3,626,883, and the expenditure, including loans repaid, \$3,371,184. Old Cambridge, as the seat of Harvard University, is one of the literary and scientific centres of the United States. Population (1880), 52,669; (1890), 70,028; (1900), 91,886, of whom 3466 were foreign-born, and 3888 were negroes. The death-rate in 1900 was 18.5.

Cambridge, the county seat of Guernsey county, Ohio, U.S.A., on the Baltimore and Ohio, and the Cleveland and Marietta (controlled by the Pennsylvania) railways, at an altitude of 842 feet. Population (1880), 2883; (1890), 4361; (1900), 8241.

Cambridge, H.R.H. George William Frederick Charles (1819—), 2ND DUKE OF K.G. (earl of Tipperary, baron Culloden, and duke of Brunswick-Luneburg), only son of Adolphus Frederick, 1st duke of Cambridge, and grandson of King George III., was born at Hanover, 26th March 1819. He was thus about two months older than his cousin, Queen Victoria, and was for that period presumptive heir to the British throne. He was educated at Hanover by the Rev. J. R. Wood, a canon of Worcester. On 3rd November 1837, the rank of colonel in the British army was conferred upon him, and he was attached to the staff at Gibraltar from 10th October 1838 to 25th April 1839. After serving in Ireland with the 12th Royal Lancers as 2nd lieutenant-colonel, he was appointed in April 1842 colonel of the 17th Light Dragoons. For two years, April 1843 to April 1845, he acted as colonel on the staff in the Ionian Islands, and was then promoted major-general. In October 1846 he took command of the Limerick district, and shortly afterwards of the Dublin district. In 1850 his father died, and he succeeded to the dukedom. Being appointed inspector of cavalry in 1852 he held that post until 1854, when, upon the outbreak of the Crimean war, he was placed in command of the two brigades of Highlanders and Guards united to form the first division of the British army. In June of the same year he was promoted lieutenant-general, and was present at the battles of the Alma, Balaklava, and Inkerman, and at the siege of Sebastopol. On 15th July 1856 he was appointed general commanding-in-chief, on 9th November 1862, field-marshal, and by letters patent, 1887, commander-in-chief. The period of thirty-three years during which H.R.H. held the command of the army was marked by many changes. The Crimean war brought to light great administrative defects, and led to a regrouping of the departments which, with the whole *personnel* of the army, were brought under the authority of the secretary of state for war. A constitutional development was thus involved, and the relations of the army to the Crown were gradually modified in some respects. Until 1870, however, the organization of the military forces was practically unaltered. The startling successes of the Prussian arms in the Austrian and French campaigns having created a profound impression, drastic changes were introduced by Mr Cardwell into the entire fabric of the army. The objects of the reformers of 1870 were undoubtedly wise; but some of the methods adopted were open to question, and were strongly resented by the

duke of Cambridge, whose views were shared by the majority of officers. The reforms of 1870-71 having largely failed to produce the results anticipated by their promoters, further changes were inaugurated in 1880, and again H.R.H. found much to criticize. His opinions stand recorded in the voluminous evidence taken by the numerous bodies appointed to inquire into the condition of the army. They contain much sound common-sense, and they show a strong attachment to the old regimental system, and a natural dread that *esprit de corps* might suffer from innovations. Throughout the period of change, H.R.H., while protesting, invariably accepted and loyally endeavoured to carry out the measures on which the Government decided. In a memorandum addressed to Mr Childers in 1880 he defined his attitude as follows:—"Should it appear, however, that for reasons of state policy it is necessary that the contemplated changes should be made, I am prepared to carry them out to the best of my ability." This attitude H.R.H. consistently maintained, and while his training and associations led him to deprecate changes the need for which was not apparent to him, his military judgment was sometimes indisputably correct. This was notably the case in regard to the ill-advised reduction of the artillery carried out by Mr. Stanhope. Under the Order in Council of February 1888, the whole responsibility for military duties of every kind was for the first time centred upon the Commander-in-Chief. This, as pointed out by Lord Hartington's commission in 1890, involved "an excessive centralization" which "must necessarily tend to weaken the sense of responsibility of the other heads of departments, and thus to diminish their efficiency." The duke of Cambridge, whose exalted position entailed many duties apart from those strictly appertaining to a Commander-in-Chief, could not give personal attention to the vast range of matters for which he was made nominally responsible. On the other hand, the adjutant-general, as "chief staff officer," could act in his name, and the Secretary of State could obtain military advice given behind his back by officials charged with no direct responsibility. The effect was to place the duke in a somewhat false position in the eyes of the Army and of the country, while power accumulated in the hands of this adjutant-general. If the administration of the army suffered after 1888, this was due to a system which violated principles.

Throughout his long term of office the duke of Cambridge evinced a warm interest in the welfare of the soldier, and great experience combined with a retentive memory made him master of military details. While quick to condemn deviations from the letter of regulations, and accustomed to insist upon great precision in drill, he was never a martinet, and his natural kindness made him ready to bestow praise. Belonging to the pre-scientific period of the British army, he could not easily adapt himself to the new conditions, and in dispensing patronage he was somewhat distrustful of originality, while his position as a member of the royal family tended to narrow his scope for selection. He was thus inclined to be influenced by considerations of pure seniority, and to underrate the claims of special ability. The army, however, always recognized that in the duke of Cambridge it had a Commander-in-Chief devoted to its interests, and keenly anxious amid many difficulties to promote its well-being. The duke resigned the Commandership-in-Chief 1st November 1895, being succeeded by Lord Wolseley. H.R.H. was colonel of the Scots Fusiliers from 1852 to 1861, of the Royal Artillery, 1861, and colonel of the Grenadier Guards since 1862. He was made Ranger of Hyde Park and St James's Park in 1852, and of Richmond Park in 1857; governor of Woolwich Academy in 1862,

and its president in 1870, and personal aide-de-camp to Queen Victoria in 1882. The chief honours conferred upon him were: G.C.H., 1825; K.G., 1835; G.C.M.G., 1845; G.C.B., 1855; K.P., 1861; K.T., 1881.

Cambridgeshire, a south midland county of England, bounded on the E. by Norfolk and Suffolk, on the S. by Essex and Hertford, on the W. by Bedford, Huntingdon, and Northampton, and on the N. by Lincoln.

Area and Population.—In 1891 the area of the ancient (geographical) county was 549,749 acres, and the population 188,961, of whom 92,513 were males, and 96,448 females, an increase of 3367 persons since 1881 (185,594), or an increase of 1·8 per cent., as compared with a decrease of 0·7 per cent. (namely 1312 persons) in the period 1871-81. In 1891 there were 0·34 persons to an acre, and 2·91 acres to a person. In the same year the area of the registration county was 565,737 acres, and the population 196,269, of whom 96,219 were males, and 100,050 females; in 1881 the registration county contained 191,289 inhabitants (94,002 males, 97,287 females). In 1901 the population of the ancient county was 190,687. Particulars of the birth-rate, death-rate, and illegitimacy-rate, and the number of persons married per 1000 inhabitants are given in the subjoined table:—

	1871-80.	1881-90.	1887-97.	1898.
Birth-rate . . .	32·3	29·3	27·2	25·4
Death-rate . . .	18·8	17·3	16·6	15·6
Illegitimacy-rate .	57	54	51	48
Marriage-rate . .	13·0	12·8	13·4	14·1

In 1891 the county contained 494 persons of Scottish birth, 439 of Irish birth, and 260 foreigners. At the same date there were 174 blind persons, 80 deaf and dumb, and 664 insane.

Administration.—The ancient county is for parliamentary purposes divided into three divisions (Northern or Wisbech, Western or Chesterton, and Eastern or Newmarket), and embraces also the parliamentary borough of Cambridge, each returning one member. The University of Cambridge also returns two members. Administratively the ancient county embraces the two counties of Cambridge and the Isle of Ely. There are two municipal boroughs, Cambridge and Wisbech; courts of quarter sessions at Cambridge and Ely; and ten petty sessional divisions. The boroughs of Cambridge and Wisbech have each a separate commission of the peace; and the University of Cambridge exercises disciplinary jurisdiction over its own members. The two administrative counties contain together 172 entire civil parishes and parts of 4 others. The ancient county contains 181 entire ecclesiastical parishes or districts, with parts of 12 others, most of them in the diocese of Ely. Spring assizes are held at Ely, summer assizes at Wisbech.

Education.—There is a day training college for schoolmasters at Cambridge, and in the same town also the New Homerton denominational training college for women (see CAMBRIDGE). At Ely a theological college was founded in 1876, the building being opened in 1881. The number of elementary schools in the county, including also the Isle of Ely, on 31st August 1898 was 224, of which 66 were board schools and 158 voluntary schools, the latter including 146 National Church of England schools. The average attendance during the year at the board schools was 8920, and at the voluntary schools 18,996. The total school board receipts for the year ending 29th September 1898 was £23,984. The income under the Technical Instruction Act was £467, and under the Agricultural Rates Act £2283.

Agriculture.—In the period 1875-99 the area under corn crops decreased, as did also the area of the green crops, chiefly miscellaneous roots and fodder plants. Potatoes, on the other hand, showed a very considerable increase. Since the year 1875 there has been a very noticeable decline in the number of sheep. The number of acres farmed by tenants was 402,450 in 1889, and 402,438 in 1899; whilst in 1889, 86,202 acres were farmed by their owners, and in 1899, 87,822 acres.

The table immediately following shows the area under the different kinds of crops at the periods named:—

Year.	Area in Cultivation.	Under Corn Crops.	Under Green Crops.	Bare Fallow.	Under Permanent Grass.
1875	483,340	261,327	85,793	16,776	...
1880	485,482	251,479	82,735	20,422	...
1885	487,496	241,777	82,102	20,040	90,894
1890	491,153	238,414	75,494	15,940	108,468
1895	488,524	222,073	76,526	18,776	117,058
1899	490,260	222,434	76,174	12,806	117,722

The next table shows the number of live stock at the periods named:—

Year.	Cows and Heifers.	Other Cattle.	Total Cattle.	Horses.	Sheep.	Pigs.
1875	47,507	26,959	321,993	43,687
1880	14,105	32,885	46,990	29,387	309,250	39,459
1885	15,276	35,299	50,575	27,476	274,493	44,858
1890	16,568	35,975	52,543	28,759	259,426	55,511
1895	15,519	32,618	48,137	31,055	213,482	56,191
1899	17,928	38,195	56,123	31,505	214,422	48,472

Cambuslang, a town of N.W. Lanarkshire, Scotland, near the Clyde, about 5 miles S.E. of Glasgow by rail, inhabited for the most part by Glasgow business men. There are 13 coal-mines in the vicinity, a turkey-red dyeing establishment, and the largest steel works in the kingdom. Recent structures are United Free churches, an institute and library, a public hall, a new bridge over the Clyde, and an Established church hall. Electric light is supplied. Population (1881), 5538; (1891), 8323; (1901), 20,212.

Camden, a city and port of entry of New Jersey, U.S.A., and capital of Camden county, situated in 39° 57' N. lat. and 75° 07' W. long., on the Delaware, opposite Philadelphia, of which it is a suburb. It is entered by three railways—the Pennsylvania, the Atlantic City, and the West Jersey and Seashore. It has extensive manufactures, in which there was invested, in 1890, a capital of \$15,244,500, employing 10,362 persons, with an output valued at \$21,145,637. The principal manufactures were iron and steel, shipbuilding, woollen and worsted goods, oil-cloth, and boots and shoes. In 1900 the assessed valuation of property, real and personal, was \$27,607,810. The net debt was \$2,453,475, and the rate of taxation \$21.40 per \$1000. Population (1880), 41,659; (1890), 58,313; (1900), 75,935, of whom 10,097 were foreign-born, and 5576 were negroes. The death-rate in 1900 was 16.3.

Camera Obscura.—The invention of this instrument has generally been ascribed, as in the ninth edition of this work, to the famous Neapolitan savant of the 16th century, Giovanni Battista della Porta, but, as a matter of fact, the principle of the simple camera obscura was well known and it was in practical use long before his time. He was anticipated in the discoveries he claimed to have made regarding it, and all he seems really to have done was to popularize it. The increasing importance of the camera obscura as a photographic instrument makes it desirable to bring together what is known of its early history, which is far more extensive than is usually realized. In southern climes, where during the summer heat it is usual to close the rooms from the glare of the sunshine outside, we may often see depicted on the walls vivid inverted images of outside objects formed by the light reflected from them passing through chinks, or small openings, in the shutters. We do not, however, find many allusions to this appearance in the ancient writers, but the correlated problem of the image of the sun passing through a quadrilateral aperture always appearing round is explained by Aristotle (*Probl.* sect. xv. cap. 5), and he further describes the appearance of the eclipsed sun or moon in the same manner through the interstices of foliage or lattice-work. These problems regarding the passage of light through small apertures and their practical application in the camera obscura, occupied the attention of many of

the master minds of the period between the 13th and 17th centuries, in which the foundations of modern science were laid. Among them were the following:—

Roger Bacon, about 1260 }
John Peckham } Optical problems.
Vitellio }
Leon Baptista Alberti, the architect, 1437. Show-box.
Leonardo da Vinci, end of 15th, or early in 16th century.
Don Papnūtius, or Panuce, before 1521.
Franciscus Maurolycus, 1522. Optics.
Erasmus Reinhold, 1540 }
Gemma Frisius, 1544 } for observing eclipses.
Jerome Cardan, 1550. Camera obscura with speculum.
Giov. Batt. Porta, 1558. Camera without lens and with speculum.
Daniele Barbaro, 1568. Camera with lens as an aid for drawing.
Egnatio Danti, 1573. Reflecting mirror for erecting images.
Ferderic Risner, before 1580. For copying maps.
Giov. Batt. Benedetti, 1585. Camera obscura with lens.
Giov. Batt. Porta, 1589. Camera obscura with lens.
Johann Kepler, 1600. Optical theory and solar observations.
Johann Fabricius, 1611. Observations of sun-spots.
Christopher Scheiner, 1611-30. Helioscope for solar observations.
Gaspar Schott, 1657. Optical theory.
Johann Zahn, 1685. Box forms of camera and optics.

That Roger Bacon was acquainted with the principle of the camera obscura is shown by his solutions of the optical problems relating to the passage of light through small round or multiangular apertures given in his *Perspectiva*, which are better and clearer than Peckham's or Vitellio's, but there is nothing to be found in his published writings to show clearly that he had constructed any instrument for viewing outside objects on that principle, though it seems possible from a passage of the *Perspectiva*, upon which Friend, in his *History of Physick*, gives him the credit of the invention. The arrangement of concave and plane mirrors, by which the realistic images of objects inside the house or in the street could be rendered visible, though intangible, there alluded to, may apply to a camera on Cardan's principle, or to a method of aerial projection by means of concave mirrors with which Bacon was quite familiar, and indeed was known long before his time.

There is no clear evidence that Alberti invented or described the camera obscura, but it appears from an extract from an anonymous biography of him, quoted by Vasari, that he constructed little boxes in which painted pictures were viewed through a small hole with great verisimilitude. He had two kinds, one for use at night, showing the moon and bright stars, and the other for day scenes. The account is vague, and seems to refer more to a magic lantern or show-box than to the camera obscura—though some forms of the latter can be used as show-boxes (Harris's *Optics*). Kircher mentions some arrangement of this kind made by an Albertus, whom he distinguishes from Albertus Magnus. Libri, in the history of the invention of the camera obscura in Italy, given in his *Histoire des sciences mathématiques en Italie*, iv. 303, makes no mention of Alberti, but he draws attention to an unpublished MS. of Leonardo da Vinci, which was first brought to light by Venturi, in his *Essai sur les ouvrages physico-mathématiques de Leonardo da Vinci* (Paris, 1797), in which the appearance of the reversed images of outside objects on a piece of paper held in front of a small hole in a darkened room is quite clearly described and explained, with a diagram, as well as its application to illustrate the phenomena of vision. This is probably the earliest distinct account of the camera obscura, though Leonardo does not mention it as an invention of his own. The first published account, however, appears, as Libri has shown, in a translation, with commentary, of the *Architecture* of Vitruvius, published at Como, in 1521, by C. Cesariano, in which he mentions an experiment made by a Benedictine monk and architect, Don Panuce, of the same kind as Leonardo's, but without the demonstration.

About the same time Maurolycus, the eminent mathematician of Messina, in his *Theoremata de Lumine et Umbra*, fully investigated the optical problems connected with vision, the passage of rays of light through small apertures with and without lenses. Risner says he has described the application of the darkened room to the observation of eclipses. In any case his theoretical work was a great advance on that of his predecessors. It is possible that Reinhold got this method of observing eclipses from Maurolycus, through Pürbach. He is said to have used it to observe an eclipse of the sun at Wittenberg, in 1540, and he certainly did so in 1544 and 1545. He has described his method in his edition of Pürbach's *Theorice Novæ Planetarum*, and says it can also be applied to observing terrestrial objects, though he only used it for the sun. Gemma Frisius has fully described the application of Reinhold's method to making measurements and drawings of the sun during eclipses, or otherwise, and gives a figure of the arrangements he adopted in observing the eclipse of January 1544 at Louvain, in his *De Radio Astronomico et Geometrico* (1545), p. 31. He says it can also be used for observations of the moon and stars and for longitudes. Moestlin adopted the same method later, and handed it on to Kepler. It had the advantage of being simple and avoiding injury to the eyes. It is interesting to note this early application of the camera obscura to the field of astronomical research, in which its latest achievements have been of such pre-eminent value.

The addition of optical appliances to the simple dark chamber seems to have been first described by Cardan, in a passage in his treatise *De Subtilitate* (1550), p. 107, which Libri has noted: "Quod si libeat spectare ea quod in via fiunt, sole splendente, in fenestra orbem è vitro collocabis, inde oclusa fenestra videbis imagines per foramen translatas in opposito plano . . . atque alia mira non solum sphericum sed et conicum ac cylindricum." From this it would appear that he used spherical mirrors, and not a lens, which might be implied by the use of the word "orbem."

We now come to Porta. In his first account of the camera obscura in the *Magia Naturalis*, in four books, Naples, 1558, no mention is made of a lens, but he discloses as a great secret, that by a proper arrangement of a concave speculum in front of the aperture the colours of objects could be seen much better. This seems, however, to be very similar to Cardan's arrangement published eight years earlier. Porta also alludes to the application of the method to painting by persons ignorant of drawing who could lay on colour. His second edition, in which he in the same words claims the discovery of the use of a convex lens in the aperture as his own, and a secret he intended to keep, was not published till 1589, thirty-one years after the first. In this interval the use of the lens was discovered and clearly described by Daniele Barbaro, a Venetian, Patriarch of Aquileia, in his work on geometrical perspective, *La Pratica della Prospettiva*, p. 192, published in 1568, or twenty-one years before Porta mentioned it. The lens used by Barbaro was an ordinary convex, or old man's, spectacle glass; concave, he says, will not do. He shows how the paper must be moved till it is brought into the focus of the lens, the use of a diaphragm to make the image clearer, and also the application of the method for drawing objects in true perspective. That Barbaro was really the first to apply the lens to the camera obscura is supported by Bettinus in the *Apiaria*, and by Schott in his *Magia Universalis*, the former taunting Porta with the appropriation. In an Italian translation of Euclid's *Optics*, published by Egnatio Danti in 1573, after discussing the effects of plane, convex, and concave reflectors, he gives a full description of the method of showing reversed images passing through an aperture in a darkened room, and shows

how by placing a mirror behind the aperture unreversed images might be obtained, illustrating the two effects with diagrams.

Risner, who died in 1580, has also in his *Opticæ* (1606) very clearly explained the reversal of the images in the camera obscura. He notes the conveniences of the method for solar observations, and its previous use by the observers already mentioned. He further points out its advantages for easily and accurately copying on an enlarged or reduced scale, especially for chorographical or topographical documents. This seems to be the first notice of the application of the camera to cartography and reproduction of drawings on various scales, which, perhaps more than anything else, is its prime use at the present day. In the *Diversarum Speculationum Mathematicarum et Physicarum*, written in 1585 by the Venetian nobleman Benedetti, there is a letter to Pirro de Arzonis, in the course of which, after discussing the destruction or weakening of the images of the camera obscura by the admission of extraneous light, he tells him of an improvement in that sort of thing some one had carried out by the use of a double convex glass in the aperture of the dark room, and that the images could be made erect by reflexion from any plane mirror. This was four years before Porta published it, and may refer to Barbaro. The account of the camera obscura given in Porta's second edition of the *Magia Naturalis*, in 1589, is expanded from the first. The use of the lens, which is given as a great secret, in place of the concave speculum of the first edition, is not so clearly described as by Barbaro; the concave speculum is used for making the images larger and clearer, and also for making them erect, but no details are given. He describes some peep-show arrangements, and indicates how the camera with a concave speculum can be used for observing eclipses. There is no mention of a portable box or construction beyond the darkened room. In his treatise *De Refractione Optices Parte* (1593), he goes into the theory of vision and the optics of the camera. He brought forward no novelty in the camera obscura, he did not improve it, his descriptions of it are vague, but were published in a book which became popular, and so he acquired credit for the invention.

The first to take up the camera obscura after Porta's second edition was Kepler, who used the method for solar observations in 1600, and in his *Ad Vitellionem Paralipomena* (1604) discusses all the old problems of the passage of light through small apertures and the rationale of the camera obscura. He was the first to make up an instrument fitted with a sight and paper screen for observing the diameters of the sun and moon in a dark room. In his later book *Dioptrice* (1611) he fully discusses refraction and the use of lenses, showing the action of the double convex lens in the camera obscura, and the principles which regulate its use, with the reason of the reversal of the image. He also shows that enlarged images can be produced by using a concave lens at a suitable distance behind the convex, as in modern telephotography. He extended the work of Maurolycus, and demonstrated the exact analogy between the eye and the camera and the arrangements by which an inverted image is produced on the retina.

About this time the telescope came into use, and the danger of observing the sun with it was soon discovered. In 1611 Fabricius published his observations of sun-spots, and describes how he and his father fell back on the old method of observing the sun's image through a small hole in a darkened room, finding that they could observe the spots just as well as in the telescope. They do not seem to have used a lens, or thought of using the telescope for projecting an enlarged image. This was done by Scheiner, who has fully described and illustrated his method in the

Rosa Ursina, published in 1636. He demonstrates very clearly and practically the advantages and disadvantages of the different methods, without a lens, with a single convex lens, and with a telescope, as used in his helioscope, which was a telephotographic arrangement on a stand on Kepler's principle. Here we first find the dark chamber constructed of wooden rods covered with cloth or paper, used separately to screen the observing tablet.

Bettinus in his *Apiaria* (1645) has described several methods of measuring the sun and terrestrial objects by the images projected through an aperture, and also methods for erecting the inverted images formed by lenses in the camera obscura. In 1646, Fr. Kircher published his well-known *Ars Magna Lucis et Umbrae*, and in it has gathered most of the information then available on the principle and use of the camera obscura and methods of optical projection. It is noticeable that he first uses the word *conclave*, a box or cage, like Scheiner's, as alternative to *camera*. The optical principles of the camera obscura with and without lens were very fully treated by Schott in the first part of his *Magia Universalis Naturæ et Artis* (1657), and he has discussed the nature and manner of production of the image on the paper, the similarity of the eye to the camera, and the phenomena of vision. In his preface there is a useful list of early writers on optics.

It is difficult to ascertain when the camera first came to England. The translation of Porta's book, *Natural Magick*, was published in 1658, and in the same year there is a mention of a portable tent camera obscura for sketching, in a work called *Graphice, or the Most Excellent Art of Painting*. In this the object glass of a "prospective image trunk," or telescope, was used alone to throw the image on a sheet of paper on which the outline could be drawn. William Molyneux has given a number of optical problems relating to lenses in his *Treatise of Dioptrics*, 1692. He states the relative proportions between the diameters of the object and the image, and their distances from the lens, and proves it geometrically by the case of the camera and lens. The analogy of the eye and the camera is also discussed, as well as the optical theory of the dark chamber or camera with and without a lens.

The first notice of a box, or portable camera with lens, appears to be in Zahn's *Oculus Artificialis Teledioptricus* (1702). He gives figures and descriptions of two forms: one a wooden box with a projecting tube, in which two or three lenses could be fitted, the image from which was thrown on a screen of oiled paper and viewed through a hole in the back of the camera about two or three inches away. The second was fitted with a reflector to throw up the image on a horizontal screen on which it would be viewed unreversed. There is also a great deal of theoretical and practical information on lenses in connexion with the camera and other optical instruments. From John Harris's *Lexicon Technicum* (1704), we find that the camera obscura fitted with the arrangement called the "scioptric ball," and known as *Sciopticks*, was on sale in London, and after this must have been in common use, either as a sketching instrument or as a show. Many patterns are described in Joseph Harris's *Treatise on Optics*, 1775, Hutton's *Philosophical and Mathematical Dictionary*, and other books on Optics and Physics of that period.

The camera obscura was first applied to photography by Thomas Wedgwood about 1802. (J. WA.*)

Camerino, a town and archbishop's see of Italy, the Marches, province of Macerata, 24 miles S.W. from Macerata, on an E. spur (1139 ft.) of the Apennines. It is the seat of a "free" university, founded in 1727, and attended in 1898 by 234 students; 18 professors. Population, about 12,000.

Cameron, Verney Lovett (1844-1894), African traveller, was born at Radipole, near Weymouth, 1st July 1844. He entered the navy in 1877, and was employed for a considerable time in the suppression of the East African slave-trade. The experience thus obtained led to his being selected to command an expedition sent out by the Royal Geographical Society in 1873, to succour Dr Livingstone. Soon after the departure of the expedition from Zanzibar, Livingstone's servants were met bearing the dead body of their master, but Cameron continued his march, reached Ujiji, on Lake Tanganyika, in February 1874, and, after solving the principal geographical problems connected with that lake, proceeded south-west, continually making discoveries in regions never before visited by any European. His travels were published, under the title *Across Africa*, in 1876. The remainder of Cameron's life was chiefly devoted to projects for the commercial development of Africa, and to writing tales for the young. He also visited the Euphrates valley in connexion with the proposed railway, and accompanied Sir Richard Burton in his West African exploration in 1882. He wrote on both subjects. He was killed by a fall from horseback when returning from hunting, 24th March 1894.

Cameroon, or KAMERUN, in West Central Africa, forms the north-west corner of the great Central African plateau. This becomes evident in its eastern section, where are wide-spreading plains, which farther west assume an undulating character, and gradually merge into a picturesque mountain range. This range, running from north to south, is flanked by a second lower parallel range in the west, with a wide valley between. In the north-west the Upper Guinea mountains send their eastern spurs just across the boundary, and from a volcanic rift, which runs south-west to north-east, the Cameroon peak rises to an elevation of 12,480 feet. Inland the Chebchi and Mandara mountains indicate the direction and extent of the rift. Geologically, these three mountain groups belong to so many different periods. The first is composed of Archaic rocks, the part belonging to the Guinea mountains is of more recent age, showing sandstones and clay schists, while the rift mountains and Cameroon peak are purely volcanic. The mountains of the plateau lose their meridional direction, sweeping grandly round to the east on reaching the eighth degree of N. lat. Here they give rise to a number of small rivers, which collect in the rift and form the Benue, that passes between the two chief groups of the rift mountains, and leaves the protectorate to join the Niger. Cameroon is thus a mountainous country, which has only, on the coast, a strip of low land. In the south, near Batango, this is very narrow; it widens towards the north. Here, at the foot of the peak, a number of estuaries cut deep bays which form excellent harbours. The small rivers which empty into them can be ascended for some miles by steam-launches. The chief rivers of the protectorate are the Lom and Nyong, next to them the Lokunja and Kribi. The two former rise on the central plateau, down which they leap in splendid cascades; through the parallel coast range they break in rapids, which indicate the extent of their navigability. It is most probable that the Sannaga, an arm of the Lom, will also prove navigable for launches in its upper course on the plateau. Through the Logone and Shari the country becomes tributary to Lake Chad, through the Sanga to the Congo.

Climate.—Cameroon has a very considerable rainfall, and though this is greater in a certain part of the year, there is hardly a month without rain. In the interior four seasons can be distinguished; a comparatively dry

and a wet one alternating. Although on the northern hemisphere, the seasons show a south equatorial character. July to October are the coldest months, and also bring most rain. On the coast the temperature is high all the year round, but in the interior it falls as the country rises. Malarial fever is frequent, and even the natives, especially imported Africans, suffer from it.

Flora and Fauna.—The southern part of the low coast is chiefly grass-land, while the river mouths and arms of the bay are lined with mangrove. The mountainous region is covered with primeval forest, in which timber and valuable woods for cabinet-making are plentiful. Most important are the *Elaeis guineensis*, *Sterculia acuminata*, and the wild coffee-tree. On Cameroon peak the forest ascends to 8000 feet; above it is grass-land. Towards the east the forest gradually grows thinner, assumes a park-like appearance, and disappears, and wide grass uplands take its place. Animals of all kinds are plentiful, including the great pachyderms and carnivora. The latter prey on the various kinds of antelopes which swarm on the grass-lands, and two kinds of buffaloes are found in the forests, which are the home of the gorilla and chimpanzee. Large rodents, like the porcupine and cane rat, are frequent. Of birds there are 316 species, and several of venomous snakes.

Ethnology.—The north of Cameroon is inhabited by Sudan negroes, the south by Bantus. The former only recently came from the north and north-east, gradually driving the Bantu before them. They are a fine race, probably of Hamitic origin; they brought horses and horned cattle with them, which were unknown in these regions until then, and they founded well-organized states, like that of Adamawa, of which Yola is the capital. The Chief, or Emir, who resides here, is nominally a subject of the so-called Emperor of Sokoto, but exercises rather independent authority over the people under his rule. He has a strong military force, consisting chiefly of well-mounted cavalry. In the lower parts of the country, in the vicinity of the rivers Benue, Faro, and Mao Kebbi, the people, who are good agriculturists, cultivate extensive fields on the hills, which, north of the river, form disconnected ranges; while south of it they represent the slope of the great central African plateau, and stock-raising forms the chief pursuit of the inhabitants. Hand in hand with the labours of the field a considerable industry is carried on. The people forge their own arms, and manufacture their own stuffs for clothing out of the native cotton. Common villages are built in the Sudanese zeriba style, surrounded with thorn fences; more important places are enclosed by a well-built wall and strongly fortified. Being of warlike disposition, the people often wage war with their neighbours and also amongst themselves. The Bantu negroes inhabit the country south of about 7° of N. lat.; they are active traders, who well understand how to keep the intertribal barter entirely in their own hands. They build square houses, and are ruled by independent chiefs, but in no case has an attempt at political organization been observed amongst them, though they quickly adapt themselves to civilization. Among the Duallas a curious system of drum signals is noteworthy.

Area and Population.—The western boundary of Cameroon was laid down in an agreement between Germany and Great Britain on 15th November 1893, and runs as follows:—From the mouth of the Rio del Rey to the rapids of the Old Calabar or Cross river under 9° 8' E. long. Thence in a straight line towards Yola, as far as the confines of that township. This, in the east, forms part of a circle, of which the radius is a line drawn from the centre of the town to a spot fully 3 miles west of

where the Faro river joins the Benue. From this point, on the left bank of the river, the line goes to the point of intersection of 13° E. long. with 10° N. lat., from here to the border of Lake Chad, 35 miles east of the meridian of the town of Kuka. The south and east boundaries were laid down by agreements between Germany and France on 24th December 1885 and 15th March 1894. The south boundary goes in an almost straight line from the mouth of the Campo river to the river Sanga. And the eastern boundary runs irregularly north to 10° N. lat., and thence eastwards to the Shari river, which it follows to Lake Chad. The protectorate measures about 191,130 square miles, and is estimated to have 3,500,000 inhabitants. In 1899 there were 425 whites, of whom 348 were German and 36 English. The principal town is Cameroon; and Buëa, Victoria, Bibundi, Batanga, and Campo are important trading stations; Aquatown and Belltown are the principal native settlements.

Administration.—Cameroon is divided into three districts, each with an administrative official, subordinate to the *Landeshauptmann* or commissioner. The forces consist of 32 Germans and 554 natives, who are distributed on a number of stations in the interior. There are two courts of law and a court of arbitration for native officers.

Education.—The Bantu are Pagans, the Sudanese Mahommedans. There are four missionary societies (American Presbyterian, Roman Catholic, Baptist, and Protestant). There are several well-attended schools, and it is a hopeful sign that the natives eagerly desire their children to learn to read and write. There are the Government schools with 500 pupils, while the missionary schools are attended by 5000 pupils.

Finance.—The revenue for 1898-99 was 1,251,387 marks, including imperial grant in aid. The budget revenue for 1899-1900 (including imperial contribution) and expenditure was 1,713,000 marks; the imperial contribution for 1900-01 is 1,197,700 marks. There are the ordinary export and import taxes, and various other dues.

Shipping.—There is regular steamship communication between Hamburg and Cameroon. The Woerman line steamers leave Hamburg monthly, and call at most of the ports of the protectorate. The African Steamship Company's and the British and African Steam Navigation Company's steamers also call once a month. In 1898-99, 66 vessels of 81,891 tons called at the ports.

Post and Telegraph.—There is no railway. Roads are gradually being built. On the rivers which run into the bay, small steam-launches ply, and communication with the Government stations in the interior is kept up through native runners. Mails are carried by German and British steamers three times a month. The protectorate belongs to the Postal Union, and the cable is connected with the British Telegraph Station at Bonny on the Niger.

Production.—Cameroon is rich in natural products; ivory is among the export articles, of which the chief are palm-oil, palm kernels, and cocoa. Rubber is collected from the *Landolphia* and various species of *Ficus*. Copal, copra, Calabar beans, and kola-nuts are exported in large quantities. There are several kinds of finely grained wood, amongst which a very dark ebony is specially remarkable. Cotton, indigo, and various fibres of plants deserve notice. The natives grow several kinds of bananas, yams and batatas, maize, pea-nuts, sugar-cane, sorghum, and pepper. Valuable minerals have not yet been found in paying quantities, though signs of gold have been discovered. Iron is smelted by the natives, who, especially amongst the Sudanese, are very clever smiths, and manufacture fine lance- and arrow-heads, knives and swords, and also hoes. Smithwork is

about the only useful form of existing industry. The natives round the bay are clever carvers of wood, and make highly ornamental figure-heads for their canoes, which also sometimes show very fine workmanship. In the interior the people use the wild-growing cotton and fibres of plants to manufacture coarse drapery and plait-work. In 1898-99 the imports were valued at 10,638,955 marks, and exports at 5,145,822 marks. Of the exports, palm-oil was valued at 893,361 marks; palm kernels, 1,365,608 marks; gum, 1,928,080 marks; ivory, 598,470 marks; cocoa, 813,115 marks.

Development.—Of old Cameroon and the neighbouring coast were known as the Oil Coast, and trading settlements were established at an early period. The trade, however, was always confined to the coast, because the Dualla and other tribes had become recognized intermediaries between the coast factories and the tribes in the interior, whither they allowed no strange trader to proceed. They took a quantity of goods on trust, visited the tribes in the forest, and bartered for ivory, rubber, and other produce. This method had become so universal, that it was called the trust system, under which name, though in a safer form, it still exists. It hampered the coast trade seriously, and had to be abolished before it was possible to open up the interior to settlers and traders. With the utmost difficulty, and not without bloodshed, this barrier was broken down, and direct communication with the higher parts of the country established, and traders from the interior induced to visit the coast. The great labour question came next. In order to lay out plantations, workers had to be brought from the interior, for the coast tribes will only trade, and not work. But the plantations have proved a success, and though coffee, tobacco, ginger, and other plants thrive well, the best article seems to be cocoa, of which more than half a million trees have been planted, which yield yearly large quantities of excellent cocoa.

Camiling, a town of 23,000 inhabitants, in the northern part of the province of Tarlac, Luzon, Philippine Islands, on a branch of the river Agno. Its products are rice, Indian corn, sugar, and indigo. Fine timber grows in the vicinity. The principal language is Pangasinan.

Cammarata, a commune of the province of Girgenti, Sicily, Italy, 28 miles N. from Girgenti by the railway to Palermo. It lies at the N.E. foot of Mount Cammarata (5181 feet), one of the loftiest summits in Sicily. It has mines of rock-salt and sulphur springs, with a bath-house. Population, about 6500.

Campagna di Roma, in the wider sense, means the plains which stretch around the city of Rome, and, in the more restricted sense, the coast-belt which extends from Civitavecchia to Terracina. By action of the Italian parliament in 1882, 1886, and 1893, great efforts have been made to cure the waterlogged condition of the marshy grounds. The methods employed have been three—(i.) the cutting of drainage channels and clearing the marshes by pumping, the method principally employed; (ii.) the system of warping, *i.e.* directing a river so that it may deposit its sedimentary matter in the lower-lying parts, thus levelling them up and consolidating them, and then leading the water away again by drainage; (iii.) the planting of firs and eucalyptus trees, *e.g.*, at Tre Fontane and elsewhere. These efforts have not been without

success, though it cannot be affirmed that the malarial Campagna is anything like healthy yet. Its bare, treeless, sun-browned expanses are still given over to herds of oxen, horses, sheep (from October to June), and buffaloes; but some fruit and wine are produced. The regulation of the rivers, more especially of the Tiber, is probably the most efficient method for coping with the problem. Since 1884 the Italian Government have been systematically enclosing, pumping dry, and generally draining the marshes of the Agro Romano, that is, the tracts around Ostia; the Isola Sacra, at the mouth of the Tiber; and Maccarese. Of the whole of the Campagna less than one-tenth comes annually under the plough. As regards the Pontine Marshes, the worst district of all, in the south, the government drainage schemes have so far reclaimed them that they are now in great part adapted for pasturage, or are even cultivated. The evil in this tract arises chiefly from the insignificant slope of the ground, so that the surface-waters are unable to find their way readily to the sea.

See Field-Marshal Count MOLTKE'S *Wanderbuch* (6th ed., Berlin, 1892).

Campania, a territorial division of Italy, bordering on the Tyrrhenian (Mediterranean) Sea, both N. and S. of Naples, and embracing the provinces of Avellino, Benevento, Caserta, Naples, and Salerno, with an area of 6289 sq. miles, and a population (1881), 2,896,577; (1901), 3,142,378. The Campania proper, immediately N. of Naples, is one of the most fertile as well as one of the most densely-peopled regions in the world. The principal products are wheat, maize, olives, wine, oranges, lemons, chestnuts, tobacco, potatoes, hemp, beans, and pease. Sulphur is mined. The coast is studded with towns and villages (*e.g.*, Naples, Castellamare, Amalfi, Sorrento, Barra, San Giorgio, Resina, Cava dei Tirreni, &c.), which are much visited for sea-bathing in summer and as health resorts in winter. The modern history is generally coincident with the history of Naples.

Campanology (from late Lat. *campana*, a bell), in its widest sense, includes the history of bells and their uses, *i.e.*, bell-lore; the scientific construction of bells, *i.e.*, bell-founding and tuning; and the science and art of bell-ringing. The two former of these heads are treated under "Bell" (*Encyclopædia Britannica*, ninth edition), and the present article will deal mainly with the third and most commonly accepted meaning of the term, *viz.*, the science and art of change-ringing as practised upon church bells or hand bells.

1. When a given number of bells are rung over and over again in the same order, from the highest note, or "treble," to the lowest, or "tenor"—1, 2, 3, 4, 5, 6, 7—they are said to be rung in "rounds." "Changes" are variations of this order—*e.g.*, **General principles.** 2 1 3 5 4 7 6, 2 3 1 4 5 6 7; and "change-ringing" is the art of ringing bells in "changes," so that a different "change" or rearrangement of order is produced at each pull of the bell-ropes, until, without any repetition of the same change, the bells come back into "rounds." The general principle of all methods of change-ringing is that each bell, after striking in the first place, or "lead," works gradually "up" to the last place, or "behind," and "down" again to the first, and that no bell ever shifts more than one place in each change. Thus the ringer of any bell knows that whatever his position in one change, his place in the next will be either the same, or the place before, or the place after. He does not have to learn by heart the different changes or variations of order; nor need he, unless he is the "conductor," know the exact order of any one change. He has to bear in mind, first, which way his bell is working, *viz.*, whether "up" from

first to last place, or "down" from last to first; secondly, in what place his bell is striking; thirdly, what bell or bells are striking immediately before or after him—this being ascertained chiefly by "rope-sight," i.e., the knack, acquired by practice, of seeing which rope is being pulled immediately before and after his own. He must also remember and apply the rules of the particular "method" (§ 3) which is being rung. The following table representing the first twenty changes of a "plain course" of "Grandsire Triples" (for these terms, see § 3) illustrates the subject-matter of this section:—

1 2 3 4 5 6 7 "Rounds."	7 5 6 1 4 2 3 (10th change.)
2 1 3 5 4 7 6 (1st change.)	5 7 1 6 2 4 3
2 3 1 4 5 6 7	5 1 7 2 6 3 4
3 2 4 1 6 5 7	1 5 2 7 3 6 4
3 4 2 6 1 7 5	1 2 5 3 7 4 6
4 3 6 2 7 1 5 (5th change.)	2 1 5 7 3 6 4 (15th change.)
4 6 3 7 2 5 1	2 5 1 3 7 4 6
6 4 7 3 5 2 1	5 2 3 1 4 7 6
6 7 4 5 3 1 2	5 3 2 4 1 6 7
7 6 5 4 1 3 2	3 5 4 2 6 1 7
	3 4 5 6 2 7 1 (20th change.)

It will be observed that at the 1st change the third bell, and at the 15th the fifth bell, according to the rule of this "method" (see § 3), strikes a second blow in the third place ("makes third's place"). This stops the regular work of the bells which at the previous change were in the 4th, 5th, 6th, and 7th places ("in 4, 5, 6, 7"), causing them to take a step backwards in their course "up" or "down," or as it is technically called, to "dodge." Were it not for this, the bells would come back into "rounds" at the 14th change. It is by the use of "place-making" and "dodging," according to the rules of various "methods," that the required number of changes, upon any number of bells, can be produced. But in order that this may be done, without the bells coming back into "rounds" (as, e.g., in the "plain course" of Grandsire Triples, above given, they will do in seventy changes), further modifications of the "coursing order," called technically "Bobs" and "Singles," must be introduced. In ringing, notice of these alterations as they occur is given by one of the ringers, who acts as "conductor," calling out "Bob" or "Single" at the right moment to warn the ringers of certain bells to make the requisite alteration in the regular work of their bells. (Hence, in ringing language, to "call" a peal or touch—to conduct it.) Particulars of these, as of other details of change-ringing, may be gathered from books dealing with the technique of the art (see § 7); but they are best mastered in actual practice. The term "single," applied to five-bell ringing, meant that, as the first three bells remained unchanged, only a single pair of bells changed places, e.g., 1 5 4 3 2, 1 5 4 2 3. On larger numbers of bells it loses this meaning; but the effect of this "call" is that the "coursing order" of a single pair of bells is inverted. The origin of "Bob" is unknown. As a "call" it was perhaps adopted as a short, sharp sound, easily uttered, and easily heard by the ringers. As applied to a "method" or system of ringing (§ 3), it may refer to the evolution of "dodging," e.g., in "Treble Bob" to the zigzag "dodging" path of the treble bell; but none of the old writers attempt to explain it.

2. The number of possible "changes" on any given series of bells may be ascertained, according to the mathematical formula of "permutations," by multiplying the number of the bells together. Thus on three bells, only 6 changes or variations of order ($1 \times 2 \times 3$) can be produced; on four bells, $1 \times 2 \times 3 \times 4 = 24$; on five, $24 \times 5 = 120$; on six, $120 \times 6 = 720$; on seven, $720 \times 7 = 5040$. A "peal" on any such number of bells is in ordinary language the ringing of all the

possible changes. But technically, only the full extent of changes upon seven bells (usually rung with a "tenor behind," § 3) is called a "peal"; a shorter performance upon seven or more bells, or the full extent upon less than seven, being, in ringing parlance, a "touch." On six bells the full extent of changes must be repeated continuously seven times ($720 \times 7 = 5040$), and on five bells forty-two times ($120 \times 42 = 5040$) to rank as a "peal." On eight or more bells 5000 changes in round numbers is accepted as the *minimum* standard for a peal; and on such numbers of bells up to twelve (the largest number used in change-ringing), peals are so arranged that the bells come into rounds at, or at some point beyond, 5000 changes. As many as 16,000 changes, occupying from nine to ten hours, have been rung upon church bells. But the great physical strain upon the ringers—to say nothing of the effect upon those who are within hearing—makes such performances exceptional. The word "peal" is often, though incorrectly, used (1) for a set of church bells ("a peal of six," "a peal of eight"), for which the correct term is "a ring" of bells; (2) for any shorter performance than a full peal (e.g., "wedding-peal," "muffled peal," &c.), called in ringing language a "touch." Its use as "method" (§ 3), found in old campanological works, is now obsolete.

3. Change-ringing upon five bells is called "Doubles," upon seven bells, "Triples," upon nine, "Caters" (Fr. *quatre*), and upon eleven, "Cinques," from the fact that at each change two, three, four or five pairs of bells change places with each other. *Methods of Change-ringing.* "Doubles" can be and are rung when there are only five bells: but as a rule these "odd-bell" systems are rung with a "tenor behind," i.e., struck at the end of each change; the number of bells in a tower being usually an even number—six, eight, ten, or twelve. In "even-bell" systems the tenor is "rung in" or "turned in," i.e., changes with the other bells, and a different terminology is employed; change-ringing on six bells being called "Minor"; on eight bells, "Major"; on ten bells, "Royal"; and on twelve, "Maximus." The principal "methods" of change-ringing, each of which has its special rules, are—(1) "Grandsire"; (2) "Plain Bob"; (3) "Treble Bob"; (4) "Stedman," from the name of its inventor, Fabian Stedman, about 1670. In "Grandsire" the treble and one other bell, in "Plain Bob" the treble alone, has a "plain hunt," i.e., works from the first place, or "lead," to the last place, or "behind," and back again, without any dodging; in "Treble Bob" the treble has a uniform but zigzag course, dodging in each place on its way up and down. This is called a "Treble Bob hunt"; and under these two heads, according to the work of the treble, are classified a variety of "plain methods" and "Treble Bob methods," among the latter being the so-called "Surprise" methods, the most complicated and difficult of all. "Stedman's principle," which is *sui generis*, consists in the three front bells ringing their six possible changes (§ 2), while the remaining pair or pairs of bells dodge. It is thus an "odd-bell" method adapted to five, seven, nine, or eleven bells; as also is "Grandsire," though occasionally rung on even numbers of bells. "Treble Bob" is always, and "Plain Bob" generally, rung on even numbers—six, eight, ten, or twelve. In ringing, whenever the treble has a uniform course, unaffected by "Bobs" or "Singles," it serves as a guide to the other changing bells, according to the place in which they meet and cross its path from "behind" to the "lead." The order in which the different dodges occur, and the "course bell," i.e., the bell which he follows from behind to lead, are also useful, and on large numbers of bells indispensable, guides to the ringer.

4. Quite distinct from the art of change-ringing is the science of "composing," i.e., arranging and uniting by the proper "calls" (§ 1), subject to certain fixed laws and conditions, a number of groups of changes, so that no one change, or series of changes represented in those groups, shall be repeated. A composition, long or short, is said to be "true" if it is free from, "false" if it involves, such repetition; and the body of ascertained laws and conditions governing true composition in any method constitutes the test or "proof" to be applied to a composition in that method to demonstrate its truth or falseness. Many practical ringers know little or nothing of the principles of composition, and are content with performing compositions received from composers, or published in ringing books and periodicals. An elaborate statement of the principles of composition in the "Grandsire" method may be found in an appendix to Snowdon's *Grandsire* (Wells Gardner and Co., 1888), by the Rev. C. D. P. Davies, M.A. Those which apply to "Treble Bob" are explained in Snowdon's *Treatise on Treble Bob*, Part I. But, so far as can be ascertained, there is no treatise dealing with the science of composition as a whole; nor is it possible here to attempt a popular exposition of its principles.

5. One of the objects kept in view by composers is musical effect. Certain sequences or contrasts of notes strike the ear as more musical than others; and an arrangement which brings up the more musical changes in quicker succession improves the musical effect of the "peal" or "touch." On seven bells all the possible changes (§ 2) must be inserted in a true peal; but on larger numbers of bells, where the choice is from an immense number of possible changes, the composer is free to select those which are most musical. Unless, however, the bells of any given "ring" are in perfect tune and harmony with each other, their musical effect must be impaired, however well they are rung. This gives importance to the science and art of bell-tuning, in which great progress has been made. The researches of the late Canon Simpson, of Fittleworth in Sussex, carried out in practice by Messrs Taylor, bell-founders, of Loughborough (who have erected special machinery for the purpose), have made it possible to tune the largest bells into perfect harmony, not only with other bells, but with themselves. A good bell, fairly struck, should give out three distinct notes—a "fundamental" note or "tonic"; the octave above, or "nominal"; and the octave below, or "hum-note." [It also gives out the "third" and "fifth" above the fundamental; but of these it is less necessary to take notice.] Very few bells, however, have any two of these notes, and hardly any all three, in unison; the "hum-notes" being generally a little sharper, and the "fundamentals" a little flatter, than their respective "nominals." In tuning a "ring" or series of bells, the practice of founders has hitherto been to take one set of notes (in England usually the nominals, on the Continent the fundamentals), and put these into tune, leaving the other tones to take care of themselves. But in different circumstances, different tones assert themselves. Thus, when bells are struck at considerable intervals, the fundamental notes, being fuller and more persistent, are more prominent; but when struck in rapid succession (as in English change-ringing, or with the higher bells of a Belgian "carillon," which take the "air"), the higher tone of the "nominal" is more perceptible. The inharmonious character of many Belgian carillons, and of certain Belgian and French rings in England, is ascribed by Canon Simpson (in his pamphlet, *Why Bells sound out of Tune*, 1897) to neglect

of the "nominals," the fundamentals only being tuned to each other. To tune a series of bells properly, the fundamental tone of each bell must be brought into true octave with its nominal, and the whole series of bells, thus rectified, put into tune with each other. The "hum-note" of each, which is the tone of the whole mass of metal, should also be in tune with the others. If flatter than the nominal, it cannot be sharpened; but if sharper (as is more usual), it may be flattened by thinning the metal near the crown of the bell. The great bell ("Great Paul") cast by Messrs Taylor for St Paul's Cathedral, London, has all its tones in true harmony, except that the tone next above the fundamental (E b) is a "fourth" (A b) instead of a "third" (G or G b). The great bell cast by the same founders for Beverley Minster is in perfect tune; and with the improved machinery now in use, there is no reason why this should not henceforth be the case with all church bells.

6. The art of scientific change-ringing, peculiar to England, does not seem to have been evolved before the middle of the 17th century. Societies or guilds of ringers, however, existed much earlier. A patent roll of 39 Henry III. (1255) confirms the "Brethren of the Guild of Westminster, who are appointed to ring the great bells there," in the enjoyment of the "privileges and free customs which they have enjoyed from the time of Edward the Confessor." In 1602 (as appears from a MS. in the library of All Souls' College, Oxford) was founded a society called the "Scholars of Cheapside." In 1637 began the "Ancient Society of College Youths," so called from their meeting to practise on the six bells at St Martin's, College Hill, a church destroyed in the Great Fire of London, 1666. At first only "rounds" and "call-changes" were rung, till about 1642, 120 "Bob Doubles" (§ 3) were achieved; but slow progress was made till 1677, when Fabian Stedman of Cambridge published his *Campanalogia*, dedicating it to this society, his method (§ 3) being first rung about this time by some of its members. Before the end of the 17th century was founded the "Society of London Scholars," the name of which was changed in 1746 to "Cumberland Youths" in compliment to the victor of Culloden. These two metropolitan societies still exist, and include in their membership most of the leading change-ringers of England: one of the oldest provincial societies being that at Saffron Walden in Essex, founded in 1623, and still holding an annual ringing festival. In the latter half of the 18th and first half of the 19th century change-ringing, which at first seems to have been an aristocratic pastime, degenerated in social repute. Church bells and their ringers, neglected by church authorities, became associated with the lower and least reputable phases of parochial life; and belfries were too often an adjunct to the pothouse. In the last half of the 19th century there has been a great revival of change-ringing, leading to improvements in belfries and in ringers, and to their gradual recognition as church workers. Diocesan or county associations for the promotion of change-ringing and of belfry reform are spreading knowledge of the art and arousing church officials to greater interest in and care for their bells. A central council of delegates from these various societies meets annually in London or at some provincial centre to discuss ringing matters, and to collect and formulate useful knowledge upon practical questions—e.g., the proper care of bells and the means of preventing annoyance from their use in the neighbourhood of houses, rules for the conduct of belfries, etc. It is now less likely than ever that the Belgian carillons, extravagantly lauded by some writers on campanology, will be

*History of
Change-
ringing.*

preferred in England to the peculiarly English system of ringing bells in peal; by which, whatever its difficulties, the musical sound of bells is most fully brought out, and their scientific construction best stimulated.

7. The literature of campanology consists chiefly of scattered treatises or pamphlets upon the technique of different methods of change-ringing, or upon the bells of particular counties or districts. The earliest that deal with the science and art of change-ringing are *Campanalogia, or the Art of Ringing Improved* (1677), and a chapter of "Advice to a Ringer" in the *School of Recreations, or Gentleman's Tutor* (1684), showing that in its early days (§ 6), campanology was a fashionable pastime. Then follow *Campanalogia, or the Art of Ringing made Easy* (Monk, 1766), *Clavis Campanalogia, a Key to Ringing* (1788), and Shipway's *Campanalogia* (1816). The revival of change-ringing in recent years has produced many manuals: e.g., Snowdon's *Rope-Sight* (explaining the "Plain Bob" method), *Grand-sire, Treatise on Treble Bob, Double Norwich Court Bob Major, and Standard Methods* (with a book of diagrams); Troyte on *Change-Ringing; The Duffield Method*, by Sir A. P. Heywood, Bart., its inventor. Somewhat prior to these are various works by the Rev. H. T. Ellacombe, inventor of a chiming apparatus which bears his name, and a pioneer in belfry reform. Among these are accounts of the church bells of Devon, Somerset, and Gloucester, and pamphlets on *Belfries and Ringers, Chiming, &c.*; much of their contents being summarized in *The Ringer's Guide to the Church Bells of Devon*, by C. Pearson (1888). A *Glossary of Technical Terms* used in connexion with church bells and change-ringing was published (1901) under the auspices of the Central Council of Church Bell Ringers (§ 6). On the history of church bells and customs connected with them much curious information is given in North's *English Bells and Bell Lore* (Leek, 1888). By the same author are monographs on the church bells of Leicestershire, Northamptonshire, Lincolnshire, and Hertfordshire. There are similar works on the church bells of Suffolk and Cambridgeshire, by Dr Raven; and of Huntingdonshire, by the Rev. T. M. N. Owen; and one on the church bells of Essex, by the Rev. C. Deedes. See also *Quarterly Review*, No. cxc. (September 1854); *Windsor Magazine*, December 1896; and two papers in the *Guardian*, 20th June and 1st August 1900. (T. L. P.)

Campbell-Bannerman, Sir Henry, (1836—), British politician, was born on 7th September 1836, being the son of the late Sir James Campbell, Bart., of Stracathro, and assumed the additional name of Bannerman in 1872, in compliance with the provisions of the will of his maternal uncle. He was educated at Glasgow University and at Trinity College, Cambridge; was returned to Parliament for Stirling in 1868; was financial secretary at the War Office from 1871 to 1874, and again from 1880 to 1882; Secretary to the Admiralty from 1882 to 1884; and Chief Secretary for Ireland from 1884 to 1885. In Mr Gladstone's short-lived administration of 1886, he was Secretary for War, and filled the same office in the Radical Government of 1892-95. In June 1895 an imputed omission on the part of the War Office to provide a due supply of small-arms ammunition for the army led to the sudden overthrow of the Rosebery ministry. A still more unexpected incident affecting his political career, was the retirement of Sir William Vernon Harcourt from the leadership of the Liberal party in the House of Commons, in December 1898; Sir Henry Campbell-Bannerman being elected to fill that position

with the general assent of his party, but in circumstances which hardly made it a bed of roses. Wealthy, popular, and possessed of a vein of oratorical humour, Sir Henry Campbell-Bannerman had earned, before his somewhat embarrassing elevation to the leadership, the general respect of all parties; and in 1895, when Mr Speaker Peel retired, he was marked out in the opinion of a large body of politicians for the Speakership, but it was understood that he declined to stand. As leader of the Opposition in the House of Commons from 1899 onwards, Sir Henry had a difficult task to perform, and he interpreted his duty as chiefly consisting in the effort to keep the Radical party together in the midst of pronounced differences. In the case of the South African war, however, his opposition to the Government was combined with a distinct tendency to favour the anti-war section. The result was that in 1901 the Liberal Imperialists showed signs of restiveness; but at a party meeting on 9th July 1901 Sir Henry was unanimously confirmed in the leadership.

Campbellton, an incorporated town in Ristigouche county, New Brunswick, situated on the Ristigouche river, 15 miles from its mouth. The Intercolonial railway passes through it, and it is the eastern terminus of the Ristigouche and Victoria railway. It contains 5 churches, 2 branch banks, 2 newspapers, a good water system, several large saw-mills and factories for the manufacture of lumber, and is a distributing centre for northern New Brunswick. Population, 4000.

Campbeltown, a royal and parliamentary burgh (Ayr group) of Argyllshire, Scotland, at the head of a bay near the southern end of the peninsula of Kintyre. Shipbuilding is now of some importance. The registered shipping at the end of 1898 was 37 vessels of 2391 tons. Vessels entered in 1888 were 1117 of 91,204 tons; in 1898, 1232 vessels of 108,882 tons. Of whisky 1,159,567 gallons were exported in 1889, and 1,199,376 in 1899. The port is the head of a fishery district (for statistics, see ARGYLLSHIRE). The value of the fish landed at the port in 1899 was £41,176. There is a large net factory. A Jubilee Commemoration drill hall has been built. One of the schools is an academy. Population of parliamentary burgh (1881), 7558; (1901), 8234.

Campeachy (Span. *Campeche*), a state of Mexico, bounded on the N. and N.W. by the Gulf of Mexico, on the N.E. by Yucatan, on the S. and S.E. by the republic of Guatemala, and on the S. and S.W. by the state of Tabasco. Its area is 18,095 square miles. The population in 1879 numbered 90,413, and in 1895 it was 88,302. The climate is hot and unhealthy. The principal industries are the exploitation of campeche or logwood, and of cabinet woods, agriculture, stock-raising, fisheries, salt deposits, extraction of henequen and its manufacturing. There are barely 30 miles of railway in operation. The state is divided into 5 *partidos*. Amongst the principal towns, besides the capital, are Champoton, El Carmen, Bolonchen Ticul, Calkini, Hecelchakan—all with populations of less than 5000 inhabitants.

CAMPEACHY, or Campeche de Baranda, capital of the state of the same name, on the Gulf of Mexico, 825 miles from the city of Mexico. The city is one of the richest and most beautiful on the gulf. The wharf is 150 feet long, but as the harbour is only 10 feet deep, large ships cannot approach it. Among the principal buildings are the City Hall, the Government building, the hospital, theatre, the market, and several churches. There are also a fine park and public garden, a public library, and a museum. There are several lines of street railways. Population, 16,647.

Camphausen, Otto von (1812-1896), Prussian statesman, was born at Hünshoven in the Rhine Provinces 21st October 1812. Having studied jurisprudence and political economy at the universities of Bonn, Heidelberg, Munich, and Berlin, he entered the judicial career at Cologne, and immediately devoted his attention to financial and commercial questions. Nominated assessor in 1837, he acted for five years in this capacity at Magdeburg and Coblenz, became in 1845 counsellor in the ministry of finance, and was in 1849 elected a member of the second chamber of the Prussian diet, joining the Moderate Liberal party. In 1869 he was appointed Minister of Finance. On taking office, he was confronted with a deficit in the revenue, which he successfully cleared off by effecting a conversion of a greater part of the state loans. The French war indemnity enabled him to redeem a considerable portion of the state debt and to remit certain taxes. He was, however, a too warm adherent of free trade principles to enjoy the confidence either of the Agrarian party or of Prince Bismarck, and his antagonism to the tobacco monopoly and the general economic policy of the latter brought about his retirement. Camphausen's great services to Prussia were recognized by his sovereign in the bestowal of the order of the Black Eagle in 1895, a dignity carrying with it a patent of nobility. He died at Berlin on 18th May 1896.

Campi Bisenzio, a town of the province of Florence, Tuscany, Italy, 7 miles N.W. from Florence, with a fine castle. Population, about 14,000.

Campion, Thomas (1566?-1620), English poet and musician, whose works have only received due recognition within the last few years. The resuscitation of his fame is largely due to the enthusiastic labour of Mr A. H. Bullen. No light has been thrown over his parentage, or the time of his birth, except that he seems to have been about twenty years of age, in 1586, when he was admitted a member of Gray's Inn. Without proceeding to the Bar, he adopted the profession of medicine, and studied for his M.D. at Cambridge, where he was "soundly learned" and "gentlemanlike qualified." Campion is first mentioned as a poet in Peele's *Honour of the Garter*, 1593; the earliest verses of his which we possess have come down to us in a MS. dated 1596. But before this he had published a collection of Latin epigrams (in 1595), no copy of which is now believed to exist. The text is, however, supposed to be that reprinted in the second book of the *Epigrammata* of 1619. In 1601 appeared *A Book of Aires*, in which the songs are believed to be entirely written by Campion, the music by him and by Rossiter. Next year Campion appeared as a critic of prosody, with his *Observations in the Art of English Poesy*, a treatise in favour of abandoning the "vulgar and unartificial custom of rhyming," in favour of accentuated, unrhymed verse. Samuel Daniel immediately replied with his *Defence of Rhyme*, published in 1602, and Ben Jonson attacked both Campion and Daniel in a tract which has been lost. Campion was chosen to write the Masque at Court, on occasion of Sir James Hay's marriage in 1607; this he dedicated to the king, and published in quarto; it is one of the best existing examples of this class of composition. In 1613 Campion was engaged on three Court masques, all of which were printed, and it is probable that he wrote many other such lyrical and musical entertainments, which served their purpose, and were not preserved. He worked, we know, with Inigo Jones, and apparently escaped those perturbations of temper which marked Ben Jonson's dealings with the irascible architect. In 1613, also, Campion issued in

folio, with music, a perfunctory collection of *Songs of Mourning* for Prince Henry; and a second collection of songs, *Two Books of Aires*, probably belongs to the same year. *A Third and Fourth Book of Aires* is undated, but has been shown by Mr Bullen to belong to 1617, and Campion published about the same time a technical treatise on counterpoint. In 1619 he republished what we suppose to be his *Poemata* of 1595, but with very large additions. On 1st March 1620, "Thomas Campion, Doctor of Physic, was buried," at St Dunstan's in the West, Fleet Street. He was probably in his fifty-fourth year. Campion's genius was recognized in his own age, and the complete oblivion into which it immediately sank is difficult to account for. This eclipse lasted, however, until a few years ago. It was dispersed by Mr Bullen, who in 1887 was the first to claim for Campion a place among the foremost lyrical poets of the Elizabethan age. The same critic persevered in drawing attention to Campion's merits, and was encouraged, in 1889, to edit a complete edition of his works. Since then, the claim of Campion has been acknowledged by competent judges. Of all the poets who in the reigns of Elizabeth and James I. made a practice of contributing words to the popular music-books, Campion was by far the greatest, whether as an artist in verse or as an improvisator. He had a very wide range; he excelled as much in an elaborate ode or epithalamium as in a simple trill of unpremeditated song. As a masque-writer, he has only one rival in English, namely Ben Jonson, and Campion's best entertainment, that on the marriage of "The Lord Hayes," is able to bear comparison with the finest of Jonson's masques. It is a curious fact that Campion, who rhymed with equal elegance and ease, and whose best songs are remarkable for their verbal music, was, at all events during some part of his career, averse from the employment of rhyme in English. The experiments he wished to introduce, his iambics, anacreontics and sapphics, are unfitted to the genius of our language, and of Campion's examples of these heresies the best that can be said is that they are more nearly successful than those of his contemporaries. But even from his remarkably adroit "Rose-cheeked Laura," we turn with eagerness to such of his rhymed pieces as that in which "White Iopë" is mentioned, or to "I care not for these ladies." (E. G.)

Campoamor y Campoosorio, Ramon de (1817-1901), Spanish poet, was born at Navia in the province of Asturias on 24th September 1817. Abandoning his first intention of entering the Jesuit order, he studied medicine at Madrid, found an opening in politics as a supporter of the Moderate party, and, after occupying several subordinate posts, became governor of Castellón de la Plana, of Alicante, and of Valencia. His Conservative tendencies grew more pronounced with time, and his *Polémicas con la Democracia* (1862) may be taken as the definitive expression of his political opinions. His first appearance as a poet dated from 1840, when he published his *Ternezas y flores*, a collection of idyllic verses, remarkable for their technical excellence. His *Ayes del Alma* (1842) and his *Fábulas morales y políticas* (1842) sustained his reputation, but showed no perceptible increase of power or skill. An epic poem in sixteen cantos, *Colón* (1853) is no more successful than modern epics usually are. Campoamor's theatrical pieces, such as *El Palacio de la Verdad* (1871), *Dies Irae* (1873), *El Honor* (1874), and *Glorias Humanas* (1885), are interesting experiments; but they are totally lacking in dramatic spirit. He has always shown a keen interest in metaphysical and philosophic questions, and has defined his position in *La Filosofía de las leyes* (1846),

El Personalismo (1855), *Lo Absoluto* (1865), and *El Ideismo* (1883). These studies are chiefly valuable as embodying fragments of self-revelation, and as having led to the composition of those *doloras*, *humoradas*, and *pequeños poemas*, which the poet's admirers consider as a new poetic species. The first collection of *Doloras* was printed in 1846, and from that date onwards new specimens have been added to each succeeding edition. It is difficult to define a *dolora*. One critic has described it as a didactic, symbolic stanza which combines the lightness and grace of the epigram, the melancholy of the *endecha*, the concise narrative of the ballad, and the philosophic intention of the apologue. The poet himself declares that a *dolora* is a dramatic *humorada*, and that a *pequeño poema* is a *dolora* on a larger scale. These definitions are unsatisfactory. The humorous, philosophic epigram is an ancient poetic form to which Campoamor has given a new name; his invention goes no farther. It cannot be denied that in the *Doloras* Campoamor's special gifts of irony, grace, and pathos find their best expression. Taking a commonplace theme, he will render in four, eight, or twelve lines a perfect miniature of condensed emotion. By his choice of a vehicle he has avoided the fatal facility and copiousness which have led many Spanish poets to destruction. It has pleased him to affect a vein of melancholy, and this affectation has been reproduced by his followers. Hence he gives the impression of insincerity, of trifling with grave subjects, and of using mysticism as a mask for frivolity. The genuine Campoamor is a poet of the sunniest humour who, under the pretence of teaching morality by satire, is really seeking to utter the gay scepticism of a genial, epicurean nature. His influence has not been altogether for good. His formula is too easily mastered, and to his example is due a perfect plague of *doloras* and *humoradas* by very minor poets who have caricatured their model. Campoamor, as he himself has said, does not practise art for art's sake; he uses art as the medium of ideas, and in ideas his imitators are poor. Campoamor died at Madrid on 12th February 1901. Of late years a deep silence had fallen upon him, and we are in a position to judge him with the impartiality of another generation. The overwhelming bulk of his work will perish; we may even say that it is already dead. His pretensions, or the pretensions put forward in his name, that he has discovered a new poetic *genre* will be rejected later, as they are rejected now by all competent judges. The title of a philosophic poet will be denied to him. But he will certainly survive, at least in extract, as a distinguished humorist, an expert in epigrammatic and sententious aphorism, an artist of extremely finished execution.

(J. F.-K.)

Campobasso, capital of the province of Campobasso, Abruzzi e Molise, Italy, situated amongst the southern Apennines, 52 miles by rail N. from Benevento. It is famous for its cutlery and arms. Population of town (1881) 14,824, (1901) 15,046; of province (1881) 365,434, (1901) 366,341.

Campos, Arsenio Martinez de (1831-1900), Spanish Marshal, Senator, and Knight of the Golden Fleece, was born at Segovia on 14th December 1831. He entered the staff college, graduated as a lieutenant in 1852, and for some years was attached to the college as an assistant professor. He took part in the Morocco campaign of 1859-60, and distinguished himself in sixteen fights, obtaining the Cross of San Fernando, and the rank of lieutenant-colonel. He then returned to the staff college as a professor. Afterwards he joined the expedition to Mexico under Prim. In 1869 he was sent to Cuba, where he was promoted to the rank of general in 1872. On his return

to the Peninsula, the Federal Republican Government in 1873 confided to General Campos several high commands, in which he again distinguished himself against the Cantonal Republicans and the Carlists. About that time he began to conspire with other partisans of the Alfonsist branch of the Bourbons, with a view to restore the son of Queen Isabella. Though he made no secret of his designs, Marshal Serrano, in 1874, appointed him to the command of a division which took part in the relief of Bilbao on 2nd May of that year, and in the operations around Estella in June. On both occasions General Campos tried in vain to induce the other commanders then and there to proclaim Alfonso XII., but he was rebuked by Marshal Concha at Bilbao, and at Tafalla by General Echague. He then affected to hold aloof, and would have been arrested, had not the Minister of War, Ceballos, answered for his good behaviour, and quartered him in Avila under surveillance. He managed to escape, and after hiding in Madrid, joined General Daban at Sagunto on 29th December 1874, where he proclaimed Alfonso XII. king of Spain. From that date he never ceased to exercise great influence in the politics of the restoration. He was considered as a sort of Supreme Councillor, being consulted by King Alfonso, and later by his widow, the queen-regent, in every important political crisis, and on every international or colonial question, especially when other generals or the army itself became troublesome. He took an important part in the military operations against the Carlists, and in the negotiations with their leaders, which put an end to the civil war in 1876. In the same way he brought about the pacification of Cuba in 1878. On his return from that island he presided over a Conservative Cabinet for a few months, but soon made way for Canovas, whom he ever afterwards treated as the leader of that party. In 1881, with other discontented generals, he assisted Sagasta in getting into office. After the death of King Alfonso, Campos steadily supported the regency of Queen Christina, and held high commands, though declining to take office. In 1893 he was selected to command the Spanish army at Melilla, and went to the court of Morocco to make an advantageous treaty of peace, which averted a war. When the Cuban rising in 1895 assumed a serious aspect, he was sent out by the Conservative Cabinet of Canovas to cope with the rebellion, but he failed in the field, as well as in his efforts to win over the Creoles, chiefly because he was not allowed to give them home rule, as he wanted. Subsequently he remained aloof from politics, and only spoke in the Senate to defend his Cuban administration and army interests. After the war with America, and the loss of the colonies in 1899, when Señor Silvela formed a new Conservative party and Cabinet, the old marshal accepted the presidency of the Senate, though his health was failing fast. He held that post up to the time of his death in 1900, during the summer recess, at Zarauz, a village on the coast of the Basque province of Guipuzcoa, where he was buried, very modestly, at his own request. His death was generally considered a great loss for the monarchy and for the Conservative party, and events soon proved this to be correct, as within a month the divisions in the party and the Cabinet brought about the fall of Silvela on the one hand, and the reappearance of Castilian militarism with Generals Weyler and Linares on the other.

(A. E. H.)

Campu Lung, a town in Rumania, chief town of the district of Muscel, pleasantly situated on the right bank of the river Oltu. The purity of the air and the picturesqueness of the surroundings have made it a popular summer resort. It contains twenty-four churches.

Fairs are held annually on 20th July and 24th October. In the neighbourhood are to be found the remains of an old Roman camp, called by the peasants Jidovi or

Gradistea. Near the town is the monastery of Campu Lung, founded by Radu Negru. Population (1895), 12,000; (1900) 13,033.

C A N A D A.

GEOGRAPHY AND STATISTICS.

THE Dominion of Canada, comprising the northern half of the continent of North America and its adjacent islands, excepting only Alaska (a dependency of the United States) and Newfoundland (still a separate colony), has an estimated area of 3,654,000 square miles. Its physical features are comparatively simple, and drawn on a large scale. Its main structural watershed is in part coincident with the Rocky Mountain range proper, or eastern member of the Cordillera, but to the northward falling back to ranges situated farther to the west in the same great mountain region. As in the southern half of the continent, however, an important modification of this general idea connects itself with the river systems of the great central zone. These, to the south, join themselves with the Mississippi, reaching the Gulf of Mexico; to the north with the Mackenzie, flowing to the Arctic Ocean, or with the Churchill and Nelson emptying into Hudson Bay. The boundary line between Canada and the United States, in the central part of the continent, in the main nearly coincides with this subsidiary east and west watershed. The most important river, whether historically or commercially, is the St Lawrence. With the great lakes from which it flows, and the magnificent system of canals constructed to overcome the natural obstacles to its navigation, it forms a great waterway to the centre of the continent. The Mackenzie, practically inaccessible to commerce at its mouth, the Yukon, or that part of it which is included in Canada, the Nelson, the Churchill, and other rivers of great length and volume, are either long sealed by ice and interrupted by rapids, or, because they traverse regions as yet unsettled, are of minor interest except to the physical geographer. From his point of view, however, there is nothing more remarkable than the intricate and comprehensive system of rivers by which almost the entire area of Canada is covered.

The Laurentian Plateau.—The ruling geological and physical feature of the North American continent is the great Laurentian plateau, or "Canadian shield," in which the shallow basin of Hudson Bay occupies a central position. This consists of very ancient crystalline rocks, resembling those of Scandinavia in age and character. It occupies the Labrador peninsula, and spreading round the southern extremity of Hudson Bay, extends north-westward to the Arctic Ocean. This constitutes the "protaxis" or nucleus of the continent. Around its borders the later geological

Geology. series, from the Cambrian upwards, have been deposited, and against it these later strata have been crushed and elevated into mountain ranges at various periods in the course of geological history. It is, therefore, the initial feature from which the chronological development of the physiography of the continent may be deduced, and this is particularly apparent in Canada, within the limits of which it is included, and of which much of the remaining territory may be regarded as bordering upon it. From the vantage-point of this Laurentian plateau the main physical features of Canada may be briefly noted, with some reference to the geological conditions upon which these respectively depend. The Laurentian plateau itself, although constituting so large a part of Canada, may, from a physiographical point of view, be regarded as a unit. It is somewhat monotonous in

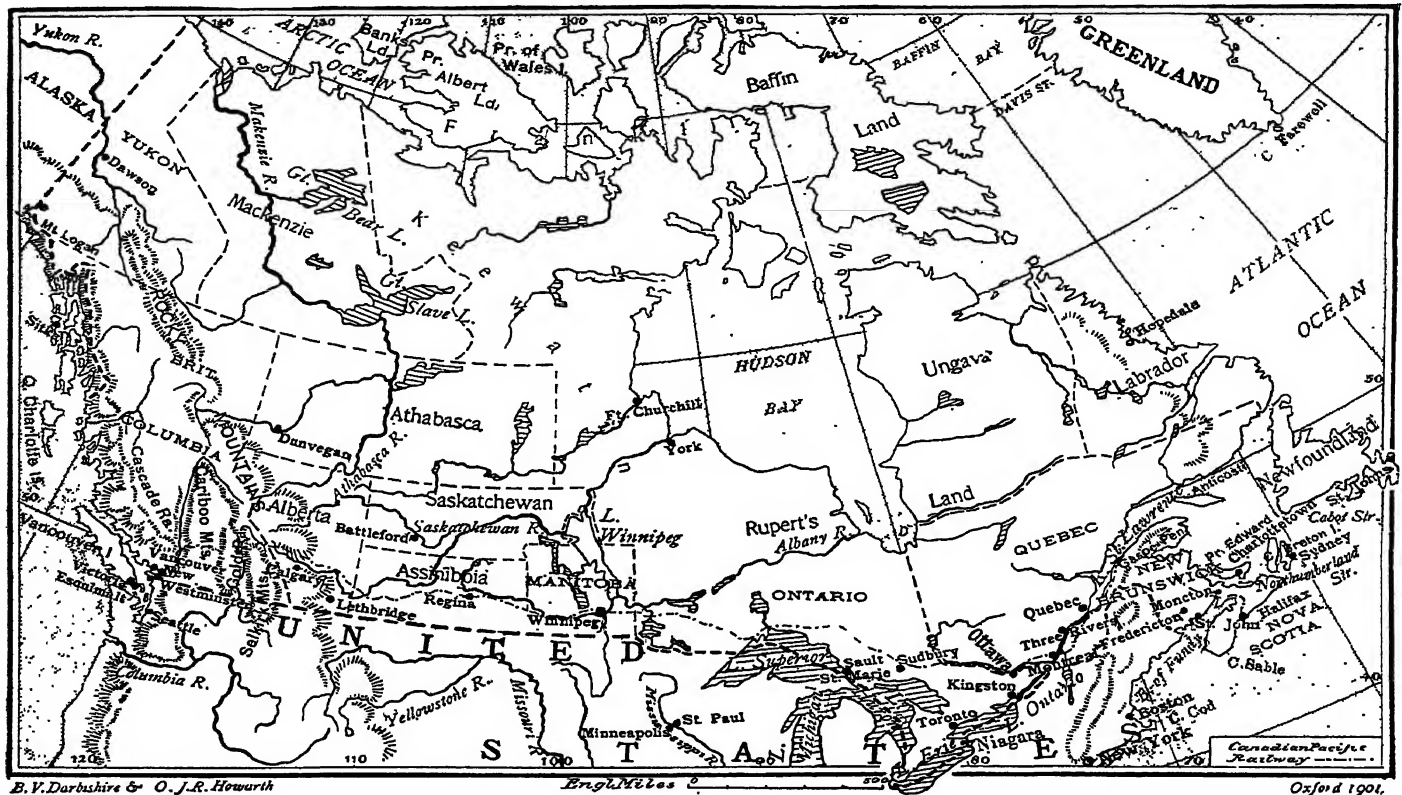

character, but constitutes a great drainage area for the supply of numerous rivers, the water-power of which, as they descend from its borders, is now beginning to be utilized on a large scale in connexion with various industries, either directly or by means of electricity generated at favourable places. It is only in a very general way that this region can be described as a plateau or tableland, for its surface is hilly, or at least mammillated, in almost every part of its extent. Its average height is about 1500 feet above the sea. In the centre of the Labrador peninsula it is about 1700 feet, but it attains considerably greater elevations along a narrow border of this peninsula where it fronts upon the Atlantic. Elsewhere it is lower, and in at least one place between Hudson Bay and the Ottawa river the watershed does not exceed 1000 feet in height. The Churchill and Nelson rivers traverse its western part in a wide depression on their way to Hudson Bay. To the north and west of these rivers its general height is about 1100 feet. Innumerable lakes and ponds, resembling those of Finland, with winding streams and rivers, characterize the main extent of the plateau. The rivers generally fall rapidly along the margins of the plateau, there cutting deep valleys, but elsewhere appear to wander irregularly without defined channels. Where not wooded, the surface often consists largely of solid rounded rock-masses. The rocks are chiefly granites and gneisses, referable to the Laurentian system, with crystalline schists of the Huronian and occasional outliers of Cambrian. Although small in comparison to its vast area, the economic importance of the Laurentian region is in the aggregate considerable. Besides the water-powers already mentioned, its southern part affords the greatest remaining forests of Eastern Canada, and mines, particularly of gold, nickel, and copper, are now being extensively developed in some of the tracts characterized by Huronian rocks.

The Acadian Region.—The "maritime provinces" of Eastern Canada, including Nova Scotia, New Brunswick, and Prince Edward Island, may be considered together; and to these provinces as politically bounded may be added, from a physical point of view, the analogous south-eastern part of Quebec—the entire area being designated the Acadian region. Taken as a whole, this eastern part of Canada, with a very irregular and extended coast-line on the Gulf of St Lawrence and the Atlantic, may be regarded as a northern continuation of the Appalachian mountain region that runs parallel to the Atlantic coast of the United States. The rocks underlying it have been subjected to successive foldings and crumplings by forces acting chiefly from the direction of the Atlantic Ocean, with alternating prolonged periods of waste and denudation. The main axis of disturbance and the highest remaining land runs through the south-eastern part of Quebec, forming the Notre Dame Mountains, and terminates in the Gaspé peninsula as the Shickshock Mountains. The first-named seldom exceed 1500 feet in height, but the Shickshocks rise above 3000 feet. The province of New Brunswick exhibits approximately parallel but subordinate ridges, with wide intervening areas of nearly flat Silurian and Carboniferous rocks. The peninsula of Nova Scotia, connected by a narrow neck with New Brunswick, is formed by still another and more definite system of parallel ridges, deeply fretted on all sides by bays and harbours. A series of quartzites and slates referred to the

Cambrian, and holding numerous and important veins of auriferous quartz, characterize its Atlantic or south-eastern side, while valuable coal-fields occur in Cape Breton and on parts of its shores on the Gulf of St. Lawrence. In New Brunswick the Carboniferous rocks occupy a large area, but the coal seams so far developed are thin and unimportant. Metalliferous ores of various kinds occur both in Nova Scotia and in this province, but with the exception of the gold already mentioned, have not yet become the objects of important industries. Copper and asbestos are the principal mineral products of that part of Quebec included in the region now under description, although many other minerals are known and already worked to some extent. Extensive tracts of good arable land exist in many parts of the Acadian region. Its

surface was originally almost entirely wooded, and the products of the forest still continue to hold a prominent place. Prince Edward Island, the smallest province of Canada, is low and undulating, based on Permo-Carboniferous and Triassic rocks affording a red and very fertile soil, much of which is under cultivation.

The St. Lawrence Plain.—The lowlands or plain of the St. Lawrence valley, extending from the vicinity of the city of Quebec to Lake Huron, with an extreme length of over 600 miles, constitute the greatest connected spread of arable land in Eastern Canada, included partly in the province of Quebec and partly in Ontario, with a total area of some 38,000 square miles. This fertile region, bounded to the south-east by the Notre Dame ranges already referred to, is limited on the south, farther west, by the St.

MAP OF CANADA.

Lawrence river and Lakes Ontario and Erie. To the north it ends along the base of the Laurentian plateau. As its uniform topographical features would indicate, it is underlain by nearly horizontal and undisturbed rocks. These range in age from Ordovician to Devonian (the latter chiefly developed in the peninsular part of Ontario), and are mainly limestones. Superposed on these rocks, the eastern part of this plain, to a line which may be drawn some distance west of Ottawa, are marine clays and sands of Pleistocene age. Farther west these are replaced by similar deposits of the same period, but without evidence of marine origin. Petroleum and natural gas occur in the rocks underlying this plain in Ontario, but metalliferous deposits are almost wanting. The continuing wealth of this region lies in its fertile soil, and within its area the largest and oldest centres of population are situated. The greater part of the length of Lake Huron and the whole northern margin of Lake Superior bathe the foot of the Laurentian plateau, which rises directly from these lakes. Continuing westward from Thunder Bay, on Lake Superior, a great southern spur of this plateau is crossed, after which

we reach the eastern edge of the interior continental plain.

The Interior Continental Plain.—This plain runs north-westward between the border of the Laurentian plateau and the line of the Rocky Mountains. It includes part of Manitoba, the whole of Assiniboia, and the greater portions of Saskatchewan, Alberta, and Athabasca. To the north-west it becomes narrowed and interrupted, but preserves its main physical features to the Arctic Ocean about the mouth of the Mackenzie. This great region of plain is 800 miles in width from east to west along the international boundary. Seven degrees of latitude farther north, it is still about 400 miles in width. To the south it constitutes the vast prairie region of Canada, with an aggregate area more than twice as large as that of Great Britain. North of the Saskatchewan river it becomes generally wooded, by reason of the greater humidity of the climate, but without essentially changing its physiographic features. From the vicinity of the Winnipeg group of lakes, where its elevation is about 800 feet above the sea, it rises gradually to the west or south-west until it attains an elevation of from 3000

to over 4000 feet along the base of the Rocky Mountains. This interior plain of the continent represents the area of an ancient sea by which it was occupied in Mesozoic times. The Cretaceous and early Tertiary rocks by which it is in the main floored still lie nearly unaltered and undisturbed where they were deposited, although now raised far above the sea-level, particularly along that border impinging upon the Rocky Mountains where they are broken into foothills along the base of the range. These strata have been subjected to great denudation, but owing to their comparatively soft character this has been, in the main, nearly uniform, and has produced no very bold features of relief. Coals and lignite coals are the principal minerals of economic value met with in the area of this central plain, but its chief value lies in its vast tracts of fertile soil or of well-grassed uplands affording perennial pasturage for cattle, horses, and sheep.

The Cordilleran Belt.—The wide mountainous Pacific border of the continent, constituting the "Rocky Mountain region," may best be named as a whole the Cordillera or Cordilleran belt. The Rocky Mountains proper in Canada comprise only the well-defined eastern system of ranges of this belt. The Cordillera includes nearly the entire province of British Columbia, with the whole of the Yukon district of the North-West Territories. Its width is about 400 miles, and it is throughout essentially a mountainous country, very complicated in its orographic features and interlocking river systems, but as yet in the main very imperfectly delineated on any maps. Two principal mountain axes may, however, be defined as its ruling features—the Rocky Mountains proper, above referred to, and the coast ranges of British Columbia. These run nearly parallel, and in a direction corresponding to that of the Pacific coast. Between them are many other ranges, but less regular in trend and much shorter, such as the Selkirk Mountains, the Gold ranges, and the Cariboo Mountains. There is also, in the southern inland country of British Columbia, a region which has, because of its essential difference from the adjacent mountain ranges, and although itself rugged and broken in character, been described as the interior plateau. This, beginning near the 49th parallel of latitude or international boundary, runs north-westwards for about 500 miles, with a general width of about 100 miles. It affords the greatest areas of arable land and pasture land comprised in British Columbia. Similar wide tracts of less broken country occur to the southward, between the mountain ranges in the Western States, and beyond it, to the north-west, after traversing an entirely mountainous region in the northern part of British Columbia, its physical characters are again to some extent repeated in the country on the Yukon watershed, where wide valleys and rolling hills alternate with short mountain ranges of no great altitude. The Pacific border of the coast ranges of British Columbia is dissected by a system of fiords perhaps unequalled elsewhere in the world. These represent submerged valleys, worn out by rivers on the steep western slope of the continent, when the land stood at a high level. A bordering mountain system of the continent, now also in a partly submerged condition, forms Vancouver Island and the Queen Charlotte Islands. The highest known mountains in the Cordillera of Canada are Mount Logan (19,500 feet), and Mount St Elias (18,000 feet), both situated near the intersection of the 141st meridian with the Pacific coast and on the borders of Alaska. The Rocky Mountains proper stand next in regard to altitude, frequently attaining 12,000 feet in their southern part, and with Robson Peak, the highest yet accurately measured, reaching 13,700 feet. Several summits in the Selkirks are known to surpass 10,000 feet, and many points in the coast ranges reach 8000 or 9000 feet.

Closely connected with the grand orographic features of this western region are its climate and its character as regards vegetation. It may, as a whole, be described as forest-clad, but forests of extraordinary luxuriance are found in the humid coast region. The conditions favourable to forest growth are to some extent repeated on the western slopes of the Selkirks, Rocky Mountains, and other main systems, on which the rainfall is ample. On the eastward slopes and in the intervening lower tracts the forests are less dense, and considerable areas of dry, open grass-land occur in the interior plateau and in many of the larger valleys. The geological structure of the Cordilleran belt is very complicated, inasmuch as the rocks of this region have been subjected to repeated flexure and disturbance, recurrent up to a late date in the geological time-scale, and therefore including all but the most recent deposits. Rocks of Archæan age occur, particularly in and near the Selkirk ranges, which, with their representatives farther to the northward, are much older than either the Rocky Mountains proper or the coast ranges. The Rocky Mountains proper are referable to folding and fracture caused by pressure of the earth's crust from the Pacific side, which has taken place chiefly at a date subsequent to the Laramie or closing stage of the Cretaceous. These mountains are mainly composed of Palæozoic rocks, ranging from early Cambrian to Carboniferous in age, and consisting in large part of limestones. The coast ranges and that of Vancouver Island, carrying with them in their elevation portions of the Cretaceous rocks, are referable, in their present form, to the same or a not much earlier date. They comprise, however, in their central parts, and particularly in the case of the coast ranges, great masses of granite that have welled up as "bathylites" along the axis of elevation. The coast ranges of British Columbia may, in fact, be considered in the main as a granitic belt, over 900 miles in length, and with a width of over 100 miles in many places. The interior plateau of British Columbia presents considerable areas of formations still nearly horizontal, and referable to various stages of the Tertiary or Cainozoic. These include the products of great volcanic activity, ending in the later Miocene in wide basaltic flows. Tertiary rocks are likewise found in some places fringing the Pacific coast, but with a limited spread. The Cordilleran belt, or Rocky Mountains region, as a whole, is the most important part of Canada in regard to mining. It constitutes the continuation to the north of the mining country of the western states of the American Union, and its length in Canada is equal to that in the United States. Its economic development has only begun in any systematic way, but great advances have already been made; means of communication have been provided in its southern part, and gold, silver, copper, lead, and other ores are now being worked on a large scale in that region. Coal has long been an important product of Vancouver Island, and valuable coal-fields are now also beginning to be worked in the Rocky Mountains proper, in the valley of the Bow river, and along the line of the Crow's Nest Pass. Attention was first directed to British Columbia as a mining country about 1858, when placer gold deposits began to be worked. The development of the rich Cariboo district followed with that of other districts less commonly known. Within the last few years the placer gold of the Yukon basin, and more particularly that of the Klondyke division, has attracted world-wide attention, and all this northern mountain country, once valued only for its scanty harvest of rich furs, is being traversed and examined by the prospector. The alluvial gold deposits are naturally those first developed, but the lodes and veins from which these have been derived, together with the deposits of other

minerals of less intrinsic value, will all in the near future be likewise utilized.

Turning back to the general physiographical features and geological history of Canada as a whole, after the above review of its several districts, it will be observed that the Laurentian plateau, with its surrounding areas of old rocks in the east, may be regarded broadly as constituting an area of which the history extends to the end of the Palæozoic era, since which it has remained comparatively unaffected by orographic movements and relatively stable. This great region stretches westwards to Manitoba and the south-western edge of the Laurentian plateau along its course to the Arctic Ocean. From this dividing line the Cretaceous and Tertiary formations become important and widespread. During the early stages of these later times the sea, extending from the Pacific side,

covered much of what is now the western part of the continent, from which it was gradually excluded by recurrent movements of elevation and mountain-making that did not affect the already stable eastern half of the continent. (G. M. D.)

Climate.—It is misleading to speak of the climate as a whole for there are many climates. Not only do the several provinces and territories differ materially, but there are great variations according to locality within most of the provinces themselves. But it may be said, in a general way, that the climates in the neighbourhood of the oceans are milder and damper than in the interior, and that the western or sea-coast portion of British Columbia is milder and damper than the maritime provinces of the Atlantic. Throughout the greater part there are extremes of temperature in winter and summer, but in summer the nights are cool and in winter the atmosphere is dry, bracing, and healthy. The rain and snowfall of the several provinces are shown for five years in the following table:—

Year.	Ontario.		Quebec.		Nova Scotia.		New Brunswick.		P. E. Island.		Manitoba.		British Columbia.		N. W. Territories.	
	Rain.		Snow.		Rain.		Snow.		Rain.		Rain.		Snow.		Rain.	
	In.	In.	In.	In.	In.	In.	In.	In.	In.	In.	In.	In.	In.	In.	In.	In.
1894	23.30	55.1	22.39	84.8	29.31	80.3	23.74	103.3	28.65	10.58	12.62	47.9	41.92	70.4	9.24	41.7
1895	20.65	81.4	25.09	93.0	36.71	75.1	31.34	88.9	32.32	99.6	14.64	44.4	35.07	67.0	10.54	31.3
1896	22.36	73.3	25.68	124.0	36.88	64.8	25.56	91.1	28.86	56.7	16.00	62.9	36.38	58.5	10.57	60.3
1897	28.31	73.0	28.09	91.4	38.94	86.5	33.76	80.3	33.63	56.4	9.66	59.1	41.10	42.6	11.84	53.2
1898	30.14	89.8	26.47	105.3	44.46	89.0	32.26	112.0	34.82	65.4	16.75	53.8	43.89	26.2	10.29	52.4

Note.—The articles on the several provinces should be consulted for close information as to climate. The case of British Columbia may be cited to show the need for this. The rain and snowfall for this province show an average of about 41 inches of rain and 53 of snow, yet in one large division of the province it may be said to rain during nearly every day in the winter, there being hardly a week of snow, while at the same time a division of many million acres is dependent on irrigation for raising its crops.

Tides.—The tides of the Atlantic and Pacific coasts, with the currents dependent upon them, possess a special importance in connexion with the navigation of the St Lawrence, which forms the main commercial avenue from the east. Of late years a systematic investigation of the tides and currents has been undertaken by the Canadian Government. The tides of the St Lawrence enter the Gulf from the Atlantic chiefly through Cabot Strait, between Cape Breton and Newfoundland, which has a width of 75 miles and a depth of 250 fathoms. The tide entering through Belle Isle Strait (12 miles wide and 30 fathoms deep) is comparatively little felt. The tide so expands in the Gulf of St Lawrence as to become almost inappreciable in places, and the greatest range is attained in Northumberland Strait and at the head of Chaleurs Bay, where it amounts to about 9 feet. At the entrance to the St Lawrence at Anticosti, it has again the oceanic range of some 6 feet, and it proceeds up the estuary with an ever-increasing range which attains its maximum of 19 feet at the lower end of Orleans Island, at 650 miles from the ocean at Cabot Strait. This must be considered as the true head of the estuary. At Quebec, 30 miles farther up, the range is nearly as great, but at 40 miles above Quebec it is largely cut off by the Richelieu rapids, and finally ceases to be felt at Three Rivers, at the lower end of Lake St Peter. On the Pacific coast the two tides of the same day are very unequal, so much so that for a month at a time there is practically only one high water and one low water during the twenty-four hours. This feature of the tide occurs widely on the western coast of America. In the Bay of Fundy the height of the tide while quite exceptional has been much exaggerated. From careful measurements made daily for four months by the engineers of the Chignecto Ship Railway, the extreme range in Cumberland basin at the head of the bay was 49.00 feet, and the average spring range was 42.21 feet. From the lowest level of low water then observed, to the level of the highest tide ever known, which flooded the country on 5th October 1869, during a severe storm, the greatest difference of level in Cumberland basin is 53 feet. At Noel Bay, near the head of the other arm of the Bay of Fundy, the range of ordinary spring tides as stated in the Admiralty charts is 50½ feet. A noteworthy tidal bore occurs at Moncton on the Petitcodiac river, at the extreme head of the Bay of Fundy. Attention has also been given to the establishment of the mean sea-level at a number of places and its reference to permanent marks. A case of special interest occurs in comparing the mean levels on opposite sides of the Chignecto Isthmus, with a range of nearly 50 feet on one side and only 8 feet on the other.

Flora.—The general flora of the Maritime Provinces, Quebec and Eastern Ontario is much the same, except that in Nova Scotia a number of species are found common also to Newfoundland that

are not apparent inland. Professor Macoun gives us a few notable species—*Calluna vulgaris*, Salisb., *Alchemilla vulgaris*, L., *Rhododendron maximum*, L., *Ilex glabra*, Gray, *Hudsonia ericoides*, L., *Gaylussacia dumosa*, F. and G., and *Scheuchzeria pumila*, Pursh. In New Brunswick the western flora begins to appear as well as immigrants from the south, while in the next eastern province, Quebec, the flora varies considerably. In the lower St Lawrence country and about the Gulf many Arctic and sub-Arctic species are found. On the shores of the lower reaches *Thalictrum alpinum*, L., *Vesicaria arctica*, Richards, *Arapis alpina*, L., *Saxifraga oppositifolia*, L., *Cerastium alpinum*, L., *Saxifraga cespitosa*, L. and S. have been gathered, and on the Shickshock Mountains of Eastern Canada *Silene acaulis*, L., *Lychnis alpina*, L., *Cassiope hypnoides*, Don., *Rhododendron lapponicum*, Wahl., and many others. On the summit of these hills (4000 feet) have been collected *Aspidium aculeatum*, Swartz var., *Scopulinum*, D. C. Eaton, *Pellaea densa*, Hook, *Galium kamtschaticum*, Sletten. From the city of Quebec westwards there is a constantly increasing ratio of southern forms, and when the mountain (so called) at Montreal is reached the representative Ontario flora begins. In Ontario the flora of the northern part is much the same as that of the Gulf of St Lawrence, but from Montreal along the Ottawa and St Lawrence valleys the flora takes a more southern aspect, and trees, shrubs, and herbaceous plants not found in the eastern parts of the Dominion become common. In the forest regions north of the lakes the vegetation on the shores of Lake Erie requires a high winter temperature, while the east and north shores of Lake Superior have a boreal vegetation that shows the summer temperature of this enormous water-stretch to be quite low. Beyond the forest country of Ontario come the prairies of Manitoba and the North-West Territories. In the ravines the eastern flora continues for some distance, and then disappearing gives place to that of the prairie, which is found everywhere between the Red River and the Rocky Mountains except in wooded and damp localities. Northwards, in the Saskatchewan country, the flora of the forest and that of the prairies intermingle. On the prairies and the foot-hills of the Rocky Mountains a great variety of grasses are found, several years' collection resulting in 42 genera and 156 species. Of the best hay and pasture grasses, *Agropyrum elymus*, *Stipa*, *Bromus*, *Agrostis*, *Calamagrostes* and *Poa*, there are 59 species. Besides the grasses there are leguminous plants valuable for pasture—*Astragalus*, *Vicia* (wild vetch), *Lathyrus* (wild pea) of which there are many species. The rose family is represented by *Prunus*, *Potentilla*, *Fragaria*, *Rosa*, *Rubus*, and *Amelanchier*.

About the saline lakes and marshes of the prairie country are found *Ruppia maritima*, L., *Heliotropium curassavicum*, L., natives of the Atlantic coast, and numerous species of *Chenopodium*, *Atriplex*, and allied genera. The flora of the forest belt of the North-West Territories differs little from that of Northern Ontario. At the beginning of the elevation of the Rocky Mountains there is a luxurious growth of herbaceous plants, including a number of rare umbellifers. At the higher levels the vegetation becomes more Arctic. Northwards the valleys of the Peace and other rivers differ little from those of Quebec and the northern prairies. On the western slope of the mountains, that is the Selkirk and Coast

ranges as distinguished from the eastern or Rocky Mountains range, the flora differs, the climate being damp instead of dry. In some of the valleys having an outlet to the south the flora is partly peculiar to the American desert, and such species as *Purshia tridentata*, D. C., and *Artemisia tridentata*, Nutt., and species of *Gilia*, *Aster*, and *Eriogonum* are found that are not met with elsewhere. Above Yale, in the drier part of the Fraser valley, the absence of rain results in the same character of flora, while in the rainy districts of the lower Fraser the vegetation is so luxuriant that it resembles that of the tropics. So in various parts of the mountainous country of British Columbia, the flora varies according to climatic conditions. Nearer the Pacific coast the woods and open spaces are filled with flowers and shrubs. Liliaceous flowers are abundant, including *Erythroniums*, *Trilliums*, *Alliums*, *Brodiaeas*, *Fritillarias*, *Silviums*, *Camassias*, and others.

Fauna.—The larger animals of Canada are the musk ox and the caribou of the barren lands, both having their habitat in the far north; the caribou of the woods, found in all the provinces except in Prince Edward Island; the moose, with an equally wide range in the wooded country; the Virginia deer, in one or other of its varietal forms, common to all the southern parts; the black-tailed deer or mule deer and allied forms, on the western edge of the plains and in British Columbia; the pronghorn antelope on the plains, and a small remnant of the once plentiful bison found in Athabasca and Mackenzie districts, now called "wood buffalo." The wapiti or American elk at one time abounded from Quebec to the Pacific, and as far north as the Peace river, but is now found only in small numbers from Manitoba westwards. In the mountains of the west are the grizzly bear, black bear, and cinnamon bear. The black bear is also common to most other parts of Canada; the polar bear everywhere along the Arctic littoral. The large or timber wolf is found in the wooded districts of all the provinces, and on the plains there is also a smaller wolf called the coyote. In British Columbia the puma or cougar, sometimes called the panther, and the American lion still frequently occur; and in all parts the common fox and the silver fox, the lynx, beaver, otter, marten, fisher, wolverene, mink, skunk, and other fur-bearing animals. Mountain and plain and Arctic hares and rabbits are plentiful or scarce in localities, according to seasons or other circum-

stances. In the mountains of British Columbia are the bighorn or Rocky Mountain sheep and the Rocky Mountain goat. The birds of Canada are mostly migratory, and are those common to the northern and central states of the United States. The wildfowl are, particularly in the west, in great numbers; their breeding-grounds extending from Manitoba and the western prairies up to Hudson Bay, the barren lands, and Arctic coasts. The several kinds of geese—including the Canada goose, the Arctic goose or wavey, the laughing goose, the brant, and others—all breed in the northern regions, but are found in great numbers throughout the several provinces, passing north in the spring and south in the autumn. There are several varieties of grouse, the largest of which is the grouse of British Columbia and the pennated grouse and the prairie chicken of Manitoba and the plains, besides the so-called pine partridge and willow partridge, both of which are grouse. While the pennated grouse (called the prairie chicken in Canada) has always been plentiful, the prairie hen (or chicken) proper is a more recent arrival from Minnesota and Dakota, to which states it had come from Illinois and the south as settlement and accompanying wheatfields extended north. In certain parts of Ontario the wild turkey is occasionally found and the ordinary quail, but in British Columbia is found the California quail, and a larger bird much resembling it called the mountain partridge. The golden eagle, bald-headed eagle, osprey, and a large variety of hawks, are common in Canada, as are the snowy owl, the horned owl, and others inhabiting northern climates. The raven frequently remains even in the colder parts throughout the winter; these, with the Canada jay, waxwing, grosbeak, and snow bunting, being the principal birds seen in Manitoba and northern districts in that season. The rook is not found, but the common crow and one or two other kinds are there during the summer. The sea-birds include a great variety of gulls, guillemots, cormorants, albatrosses (four species), fulmars, and petrels, and in the Gulf of St Lawrence the gannet is very abundant. Nearly all the sea-birds of Great Britain are found in Canadian waters, or are represented by closely allied species.

Area and Population.—The following table shows the present division of the Dominion into provinces, with the capital and, as accurately as computation on such points is possible, the area and population of each:—

Provinces.	Area : Square Miles.	Population.		Official Capital.	Lat. N.	Long. W.
		1881.	1901.			
Ontario . . .	220,000	1,926,922	2,167,978	Toronto . .	43° 39'	79° 23'
Quebec . . .	347,000	1,359,027	1,620,974	Quebec . .	46° 48'	71° 13'
Nova Scotia . .	20,600	440,572	459,116	Halifax . .	44° 39'	63° 36'
New Brunswick .	28,200	321,233	331,093	Fredericton .	45° 57'	66° 38'
Manitoba . . .	73,956	62,260	246,464	Winnipeg . .	49° 53'	97° 70'
British Columbia .	383,300	49,459	190,000	Victoria . .	48° 24'	123° 19'
Prince Edward Island .	2,000	108,891	103,258	Charlottetown .	46° 14'	63° 10'
North-West Territories	2,330,540 ¹	25,515	220,000	{ Regina . .	50° 27'	104° 37'
The Yukon . . .	198,300 }			{ Dawson . .		
The Dominion . .	3,603,896 ²	4,293,879	5,338,883	Ottawa . .	45° 26'	75° 42'

In 1874 Canada included nearly the whole of British America, but there still remained the Arctic islands and other districts within the Arctic circle that became a portion of the Dominion only in 1880, when all British possessions in North America, excepting Newfoundland, were annexed to Canada. West of the province of Ontario, then inaccurately defined, the provinces of Manitoba and British Columbia were the only organized divisions of the western territory, but in 1882 the provisional districts of Assiniboia, Athabasca, Alberta, and Saskatchewan were formed, leaving the remainder of the north-west as unorganized territories, a certain portion of the north-east, called Keewatin, having previously been placed under the governor of Manitoba. These territories were placed under a lieutenant-governor and council appointed by the Federal Government, but from time to time the principle of self-government was expanded until they now live under almost the same political conditions as the several provinces. In 1898, owing to the influx of miners and others, an Act was passed constituting the Yukon territory under a form of government specially created for its management. The other unorganized territories are only sparsely inhabited, and almost entirely by Indians, the people of the Hudson Bay Company's posts, and a few missions. Newfoundland, and with it Labrador, will probably be united to Canada before many years, as the objections on either side are disappearing, and in that event Canada will embrace the whole of British North America.

Population.—The census of the Dominion is taken every ten

years (Manitoba every five), and the growth of population, which, however, had not at the last enumeration quite come up, in certain instances, to expectations formed on the opening up of the North-West Territories, is shown by the following figures:—1871, 3,518,411; 1881, 4,336,504; 1891, 4,839,239; 1901, 5,338,883.

The density of population is greatest in Prince Edward Island, where it is 51.6 to the square mile; in Nova Scotia it is 22.3; New Brunswick, 11.6; Ontario, 9.9; Quebec, 4.7; Manitoba, 3.3; British Columbia, 0.5; Territories, 0.1; the Dominion, 1.3. This is not an indication of the density in settled parts; as in the cases of Quebec, Ontario, and British Columbia there are enormous districts where there is no population at all, but the area of which enters into the calculation. The population is composed mainly of English- or French-speaking people. There are German settlements of some extent in Ontario, and of late years there has been a large immigration of people from other parts of Europe, including Russians, Doukhobors, Galicians, and Polish and Russian Jews, as well as a large number of Icelanders and Mennonites. English and Scots and their descendants form the bulk of the population of Ontario, French Canadians of Quebec, Scots of Nova Scotia, the Irish of a large proportion of New Brunswick. Manitoba is largely peopled from Ontario, together with the decreasing numbers of half-breeds—French and English—who originally comprised the bulk of its inhabitants. The Territories, particularly the ranching districts, have a larger proportion of English than of other classifications, and British Columbia contains an assorted population, of which a

provinces. The total area of the Dominion, however, disregarding Franklin district, is officially returned as 3,653,946 square miles, the great lakes and rivers 47,000 square miles.

¹ i.e., disregarding the figures for Franklin district as "unknown." It is estimated that the area of this division is, approximately, 590,000 square miles.

² This is the sum of the areas attributed in the table to the several

large proportion in the mining districts are Americans, and in the cities Chinese with some Japanese. The mixed nationality of the population is also remarkable in the town of Lethbridge, in South Alberta, as well as in the city of Victoria, British Columbia. Since 1876 there has been a great change throughout the west, *i.e.*, from Lake Superior to the Pacific. Then Manitoba was principally inhabited by English and French half-breeds (or Metis), descendants of Hudson Bay Company's employees, or adventurous pioneers from Quebec, together with Scots settlers, descendants of those brought out by Lord Selkirk, some English army pensioners and others, and the van of the immigration that shortly followed from Ontario. Beyond Manitoba bison were still running on the plains, and British Columbia having lost its mining population of 1859 and 1860 was inhabited by Indians, and its white population were principally Englishmen and others who had drifted westwards. Domestic cattle and grain have taken the place of the bison, while a rapidly increasing English-speaking population is supplemented by 7000 Doukhobors, and about 18,000 Galicians. French is the language of the people of Quebec, though English is much spoken in the eastern townships and equally with French in the cities, both languages being officially recognized in that province as in the Federal

courts and parliament. Elsewhere English is exclusively used, except by the newly-arrived foreigners. The male sex was at the census of 1891 predominant in all the provinces except Quebec (where the sexes were about equal), the males in the Dominion numbering 2,460,471 and the females 2,372,768. The greatest discrepancies were in British Columbia with a surplus of 27,833 males, Ontario with 24,653, Manitoba with 16,178, and the Territories 8603, though this order would be entirely changed were the discrepancy to be exhibited with a percentage of the people. The figures of the census of 1891 for the occupations of the people are used here, and to them should be added about 7½ per cent. to agree with the later population. The percentage of miners, however, is necessarily disturbed by the recent aggregations in British Columbia and the Yukon:—persons engaged in agriculture, 735,207; in mining, 15,168; in fishing, 27,079; in lumbering, 12,756; in manufacturing, 320,001; in transportation, 186,495; professional, 63,280; students for professions, 10,867. In the non-productive classes:—Indian chiefs, 143; members of religious orders, 9239; paupers, 16,950; pensioners, 179; retired persons, 15,607.

The following table (1891) shows the population by creeds:—

Provinces.	Church of England.	Methodists.	Presbyterians.	Baptists.	Other Denominations.	Total.	Roman Catholics.	Grand Total.
Ontario	385,999	654,033	453,147	106,047	156,795	1,756,021	358,300	2,114,321
Quebec	75,472	39,544	52,673	7,991	21,146	196,826	1,291,709	1,488,535
Nova Scotia	64,410	54,195	108,952	83,122	17,265	327,944	122,452	450,396
New Brunswick	43,095	35,504	40,639	79,649	6,415	205,302	115,961	321,263
Manitoba	30,852	23,437	39,001	16,112	17,533	131,935	20,571	152,506
British Columbia	23,619	14,298	15,284	3,098	21,031	77,330	26,843	104,173

The North-West Territories	15,966	8,158	12,558	1,555	46,386	84,623	14,344	98,967
Canada	646,059	847,765	755,326	303,839	288,233	2,841,222	1,998,017	4,839,239

Indians.—The Indian population numbers about 100,000. Except in British Columbia and the unorganized Territories, nearly all of these are on reservations, where they are under Government supervision, receiving an annuity in money and a certain amount of provisions; and where, by means of industrial schools and other methods, civilized habits are superseding the former mode of life. The Indian population slightly increased in the decade 1890-1900. British Columbia has about 25,000, most of whom are along the coast, though one of the important tribes, the Shuswaps, are in the interior. Manitoba and the North-West Territories have the next largest number of Indians. Ontario has 20,610. They are entirely civilized, and many of them are good farmers. Quebec has 10,677; Nova Scotia, 2027; New Brunswick, 1627; Prince Edward Island, 314. The Peace River Indians number about 900, and the number computed for the outside territories is 17,648, in which are included the Eskimo of the barren lands and Arctic coasts. The Government acts as trustees for the Indians, investing their moneys accruing from the sale of lands, timber, &c., which in 1898 amounted to \$3,725,747, and parliament annually makes a large appropriation for the payment of their annuities, schools, expenses of management, &c.

Chinese and Japanese.—The Chinese and Japanese are nearly all in British Columbia. By an Act of 1895 the Chinese are compelled to pay a fee of \$50 on entering Canada. From 1896 to 1898, 20,017 paid this fee, and 351 entered exempt from payment. In 1897 the British Columbia legislature passed an Act to prevent the underground employment of Chinese and Japanese in the coal and other mines, but the Federal Government disallowed the Act so far as it related to Japanese.

Births, Marriages, and Deaths.—In the absence of a uniform system of registration, a complete return of births, deaths, and marriages is not obtainable. The following are the figures for 1897:—

Provinces.	Births.	Deaths.	Marriages.	Illegitimate.
Ontario	47,232	27,633	15,293	728
Quebec	58,433	34,287	10,291	...
Nova Scotia	2,044	...
New Brunswick	6,026	2,877	3,872	...
Manitoba	3,426	1,933	2,930	...
British Columbia	1,331	1,013	1,258	...

The four cities showing the largest rates (1897) are:—

Cities.	Births.	Deaths.	Marriages.
Montreal	9152	7584	1851
Toronto	4073	3122	1501
Quebec	2310	1755	418
Ottawa	1273	1242	479

Constitution.—The Dominion is a federation of the British colonies in North America (Newfoundland excepted), with the addition of Rupert Land and other territories formerly under the rule of the Hudson Bay Company. It is governed by a parliament consisting of the Sovereign, represented by a Governor-General, an Upper House called the Senate, and a House of Commons. The members of the Senate are appointed for life by the Government of the day, and they are 81 in number—being 24 members each from Ontario and Quebec, 10 each from Nova Scotia and New Brunswick, 4 each from Prince Edward Island and Manitoba, 3 from British Columbia, and 2 from the organized Territories. The number of representatives in the House of Commons is re-arranged after each decennial census in such a way that the province of Quebec shall always have 65 members, and every other province such number as will give the same proportion of representatives to its population as the number 65 is to the population of Quebec. By the terms of union with Canada, British Columbia was never to have less than 6 members. Each province is presided over by a lieutenant-governor appointed by the Governor-General in Council for a term of 5 years, and has its own legislature and executive council, the jurisdiction of the provincial legislatures being described and limited by the imperial Act of 1867 federating the colonies. At this date Quebec and Nova Scotia were given two chambers—a legislative council and legislative assembly—the one appointed and the other elected; and on the creation of Manitoba (1870), two chambers were given to that province. Quebec and Nova Scotia are the only provinces now retaining a legislative council. These legislatures have exclusive jurisdiction over their own range of subjects, but their Acts are nevertheless subject to disallowance (within one year of their passage) by the Federal Government, in the same way that the Acts of the parliament of the Dominion are subject (within two years) to disallowance by the imperial Government. This power has been used, though rarely, in both cases. Matters of purely local interest are dealt with by the municipalities into which the several provinces are divided. The organized Territories were at

first governed by the lieutenant-governor of Manitoba and a separate council for the North-West, then by an appointed governor and council (1875), until by successive developments in the direction of self-government they obtained an almost full measure of responsible government in 1897. The power of local taxation has, however, not yet been granted. The Yukon district of the North-West Territories was, in 1898, politically separated from the rest of the territories and given a government of its own, consisting of a commissioner and appointed advisory council. The unorganized Territories are under the governance of the Dominion Government. The franchise for the Dominion electors is at present the same as that for the provinces, and is so wide as almost to amount to residential manhood suffrage. The limits of the federal and provincial powers are defined by the British North America Act (1867) with the residue of power vested in the Federal parliament, the opposite principle to that of the United States and the commonwealth of Australia. In some points the two jurisdictions overlap, but decisions of the Supreme Court of Canada and the judicial committee of the British Privy Council are gradually settling disputable points. In the working of the several Governments the customs and practices of the imperial Parliament are followed. The following is a list of the Governor-Generals since confederation: Viscount Monk, 1st June 1867; Sir John Young (afterwards Baron Lisgar), 29th December 1868; the earl of Dufferin, 22nd May 1872; the marquis of Lorne (afterwards duke of Argyll), 5th October 1878; the marquis of Lansdowne, 18th August 1883; Lord Stanley of Preston (afterwards earl of Derby), 1st May 1888; the earl of Aberdeen, 22nd May 1893; the earl of Minto, 20th July 1898.

Justice.—The Supreme Court is the highest in the Dominion. It has appellate, criminal, and civil jurisdiction as well as appellate jurisdiction in cases between the Dominion and any of the provinces, and between one province and another on condition that legislatures pass Acts agreeing to such jurisdiction. By Act of Parliament the Governor-General in Council may refer to the Supreme Court for an opinion upon any matter which he deems advisable in the public interest. There is a chief justice and five puisne judges, and except in criminal cases an appeal lies from the Supreme Court to the Privy Council in England. The Exchequer Court, presided over by a single judge, has exclusive jurisdiction in cases in which a claim for money is made against the Crown or any of its officers, and also in cases where it is desired to enforce any law relating to the revenue, and it is a colonial court of Admiralty. In the provinces the superior courts have various distinctive names and varying numbers of judges, in addition to the county courts

with limited jurisdiction. In the Territories there are no county court judges; police magistrates and appointed justices taking their places. The provinces create their own courts, but the Federal Government appoints and pays the judges. The commissioner and the assistant commissioner of the North-West Mounted Police exercise the power of a stipendiary magistrate, the inspectors that of a justice of the peace. In the unorganized Territories the law of England so far as applicable is in force.

There are five penitentiaries in Canada, containing, on 30th June 1898, 1414 male prisoners and 32 females. All convictions for two years or over go to the penitentiaries.

Insane.—The census of 1891 showed 13,355 insane in the Dominion, of which 7162 were males and 6193 females, the greatest number, 5369, being between the ages of 40 and 69 years. The percentage showed that in every 10,000 males there were 29.1 insane, and 26.1 in every 10,000 females. Of the whole number 3044 were foreign-born and 2793 were born in Canada, both parents being foreigners. There are 18 asylums for the insane, most of which are supported by the Government, aided in some cases by the municipalities.

Education.—The British North America Act imposes the duty of legislating on educational matters on the provincial legislatures, the privileges of the minority in Ontario and Quebec—that is, the separate schools—being specially safeguarded. In other provinces this limitation does not exist. In 1880 the New Brunswick legislature abolished the separate school system, and a contest arose which was finally settled by the authority of the legislature being sustained, but certain concessions were made to the Roman Catholic dissentients which practically met their objections. Subsequently a similar difficulty occurred in Manitoba, when the legislature in 1890 abolished the system of separate schools which had been established in 1871. Owing to ambiguity in the Acts the power of the legislature was disputed, and after going through the courts with opposing decisions the case went to the Privy Council in England. Their decision was ambiguous, but practically relegated the matter to the Dominion Government. An attempt was made by it to restore the separate schools, but was successfully resisted by the Manitoba Government, and at the general election for the House of Commons in 1896 the Manitoba school question became a principal issue, with the result of overturning the Government. Though the dissentient Roman Catholics did not acquiesce in this verdict, the question is practically settled against the restoration of the separate school system. In Canada there are public schools or common schools, high schools, model and normal schools, denominational schools, colleges, and degree-granting universities, private schools, agricultural and art colleges. The public schools are under the control of local boards of trustees, elected by the ratepayers, and at these only certificated teachers are employed. The high schools, grammar schools, and colleges have a higher curriculum than the public schools, and are not free. The model schools are for the training of teachers desiring a 2nd or 3rd class certificate; the normal schools for those requiring a 1st class certificate. In addition to these there are night schools and kindergartens, and a few schools for the deaf and dumb. The general outline of education in the Dominion may be seen from the following tabular statement:—

Provinces.	Year.	Schools.		Pupils in.		Attendance in Public Schools.	
		Public.	Other.	Public.	Other.	Average.	Percentage.
Ontario	31st Dec. 1897	6,009	203	482,777	27,079	273,544	56.66
Quebec	30th June 1898	5,167	690	204,259	101,260	143,665	70.33
Nova Scotia	31st July 1898	2,385	20	101,203	2,046	57,771	57.08
New Brunswick	30th June 1898	1,778	15	63,833	1,143	38,874	61.38
Manitoba	31st Dec. 1897	1,068	4	39,841	1,044	21,500	53.96
British Columbia	30th June 1898	257	4	17,189	459	10,779	62.71
Prince Edward Island	Do.	468	included	21,285	included	13,377	61.22
The Territories	31st Dec. 1898	426	...	16,754	...	8,827	52.69
The Dominion	17,558	936	946,641	133,031	568,337	60.00

Provinces.	Teachers.		Revenue.		Expenditure.
	Public Schools.	Other Schools.	Government.	Other Sources.	
Ontario	9,128	626	\$1,626,593	\$3,861,562	\$4,215,670
Quebec	5,909	3643	304,410	1,425,986	1,730,396
Nova Scotia	2,510	60	245,837	592,973	838,810
New Brunswick	1,864	39	188,104	320,807	488,829
Manitoba	1,197	13	156,747	525,482	805,417
British Columbia	410	12	290,255	...	290,255
Prince Edward Island	579	included	129,818	33,215	163,033
The Territories	483	..	133,643	not given	not given
The Dominion	22,080	4393	3,075,407	6,260,025	8,527,410

In every province there are denominational colleges and institutions for higher education, and there are universities, most of which have degree-conferring powers. Some of them are of old standing. With the exception of St Joseph's College University, New Brunswick, and the University of Ottawa, all are endowed either with money or land in amounts varying from \$50,000 to \$2,750,000. There are also a number of so-called classical colleges in Quebec, educating both boys and men, and most of these are affiliated with Leval University. As an adjunct to education may be mentioned the libraries (mechanics' institutes are now "public libraries"), of which there are law, 21; legislatures, 9; public, 325; collegiate, 62; medical and historical, 29; special, 2; Y.M.C.A., 32.

Finance.—The revenue is derived mainly from customs and excise duties, with subsidiary amounts from mining licenses, timber dues, post office, &c. Both the revenue and expenditure fluctuate considerably, the revenue for the decade 1890-99 ranging from 35 to nearly 47 millions. The receipts on consolidated fund account for 1899 amounted to \$46,743,249 against an expenditure chargeable to consolidated fund of \$41,903,500, showing an apparent surplus of \$4,839,749. In 1899 the expenditure chargeable to capital, with railway and other charges, brought up the total disbursements to \$51,542,635. The revenue of 1899 was derived from customs, \$25,178,785; excise, \$9,641,227; post office (gross), \$4,336,278; public works, railways, and canals, \$369,044; weights and measures, \$91,059; interest on investments, \$1,590,447; fisheries, \$85,502; miscellaneous, \$5,450,907. The expenditure of the consolidated fund covers payments peculiar to Canada, including payments to Indian tribes and subsidies to provinces. The debt of the Dominion in 1879, 1889, and 1899 was:—

	1879.	1889.	1899.
Gross debt . . .	\$179,483,871	\$287,722,062	\$345,160,902
Assets . . .	36,493,654	50,192,021	78,887,456
Net debt . . .	142,990,217	237,530,041	266,273,446

A large part of the debt arises from the assumption of certain debts of the provinces as they entered the confederation, other debts subsequently assumed, and expenditure on canals and assistance given to railways. This debt does not include the debts of the provinces since confederation, a matter which concerns each province only. The canals, including the deepening of the channel of the St Lawrence, represent an amount of \$75,000,000; the railways, including the building of the Intercolonial and Prince Edward Island railway, \$941,297,037, of which amount the Dominion Government contributed in money \$151,509,812. The money circulation consists of Dominion notes (legal tender) and the notes of the chartered banks, together with gold, silver, and copper coin. Gold, however, is little used in daily business. The Dominion notes are of the following denominations: \$1, \$2, \$4, \$500, \$1000, the two last being exclusively used by the banks. English bank-notes, gold, and silver are subject to a variable rate of exchange, but United States notes are usually received at par in the larger cities, though subject to a discount when received in Government institutions. The average monthly circulation of Dominion notes of all denominations in 1899 was \$23,229,779, against which the Treasury held specie, guaranteed sterling debentures, and unguaranteed \$32,441,074. The only direct taxation is that imposed by the several cities, towns, and municipalities on their own inhabitants, and this taxation necessarily varies according to the needs and circumstances of each locality.

Defence.—The naval forces, which at present consist of a fishery protection service, are under the minister of marine and fisheries; the militia is managed by the minister and department of militia, and is always commanded by a general who is an imperial officer. There are three small bodies of permanent troops, called schools, designed to serve as an educational source for the militia. They number 161 dragoons, 430 artillery, and 395 infantry, but can be increased as occasion warrants. The active militia numbers 36,650, comprising all branches of the regular army. At Kingston, Ontario, there is a military college, to the successful graduates of which a variable number of commissions in the British army is annually awarded. Though not strictly belonging to the militia, the North-West Mounted Police is a body of highly efficient cavalry, about 700 strong. There are always some imperial troops at Halifax under the command of a general, who on the absence from Canada of the Governor-General becomes administrator of the Dominion. The harbours of Halifax in Nova Scotia, and Esquimalt in Vancouver Island, British Columbia, are fortified by the imperial Government.

Production.—Agriculture is the chief industry. Ontario, Manitoba, and sections of the Territories are the principal wheat-growing provinces, but though cattle, sheep, and horses are successfully raised in all the provinces, the districts in which the stock ranches are found are in Western Assiniboia, Southern Alberta, and some parts of British Columbia. All kinds of grain are raised in Canada, but not uniformly throughout the several provinces. In the

Maritime Provinces, Quebec, Ontario, and British Columbia, much of the grain is sown in autumn, and comprises different varieties of wheat and of oats. The agricultural returns will necessarily increase year by year as immigration continues and new lands are opened up. The largest amount in value of agricultural produce exported in 1900 was wheat, \$11,995,488, to which should properly be added wheat flour, \$2,791,885; cheese, \$19,856,324; bacon, \$12,808,084; cattle, \$9,080,776; oats, \$2,143,179; butter, \$5,122,156; sheep, \$1,894,012; peas, \$2,145,471; horses, \$898,063; apples, \$2,789,125; eggs, \$1,457,902; and other animal produce, \$2,527,805. These are the only products of the farm that realized over one million dollars each, but their value, with that of other agricultural produce exported in 1900, amounted to \$77,810,532, exclusive of horses. (See also under AGRICULTURE below.)

Mining.—The mineral districts occur from Nova Scotia to the islands in the Pacific, British Columbia and the Yukon being the chief producers of 1898. The following statement shows the value of all the minerals, metallic and non-metallic, produced in Canada during 1898:—

Metallic.		Non-metallic.	
Antimony . . .	\$20,000	Asbestos . . .	\$491,197
Copper . . .	2,134,980	Chromite . . .	24,252
Gold . . .	13,775,420	Coal . . .	8,222,878
Iron ore . . .	152,788	Grindstones . . .	44,775
Lead . . .	1,206,399	Gypsum . . .	232,515
Nickel . . .	1,820,838	Natural gas . . .	322,123
Platinum . . .	1,500	Petroleum . . .	1,061,749
Silver . . .	2,593,929	Pyrites . . .	128,872
		All others . . .	6,426,797
	<u>\$21,705,854</u>		<u>\$16,955,158</u>

The mineral fields of Southern British Columbia and the Yukon territory are only in the infancy of production, and the coal-fields opened up by the Canadian Pacific railway in the eastern part of British Columbia are of very great extent. The nickel mines are on the north shores of Lake Superior, and there are indications of a large undeveloped area in the neighbourhood of Sudbury, where the mines at work are situated.

Manufactures.—In 1898 Canada exported \$31,179,113 worth of manufactures, a great proportion of this being the produce of the mine, the forest, the sea, and the farm, but since the adoption of the national policy the manufacture of goods for home consumption has very largely increased, such as cotton and woollen goods, boots and shoes, agricultural implements, and a variety of miscellaneous articles previously imported, and the countries sending the largest amounts, are, in their order, United States, Great Britain, Germany, France, and Holland. The principal classes of goods imported for home consumption are bread-stuffs, carriages, articles of cotton, articles of flax, hemp and jute, iron and steel, oils, leather, paper, provisions, silk and woollen goods. Bread-stuffs comprise rice, sago, tapioca, and other articles not of wheat product.

Fisheries.—The principal fisheries are those on the Atlantic coast carried on by the inhabitants of Nova Scotia, New Brunswick, Prince Edward Island, and to some extent by the people of the eastern section of Quebec. Cod, herring, mackerel, and lobsters are the chief product of the fisheries, though halibut, salmon, anchovies, and so-called sardines are also exported. In British Columbian waters the main catch is of salmon, in addition to which are halibut, oolachan, herring, sturgeon, cod, shell-fish, and fish taken for their oil value—namely, the dog-fish and basking shark and the rat-fish. Ontario and Manitoba produce white fish, sturgeon, and other freshwater fish. In 1897 there were 78,959 persons engaged in the fishing industry, though only 27,079 were permanently so employed. The total production of fish in 1897 was in value \$22,783,546, of which \$10,841,661 was exported and the balance consumed at home, this being augmented (for bait and other purposes) by importations to the amount of \$784,323.

The business of fur-seal catching is carried on to some extent in the North Pacific by sealers from Victoria, but the returns of the last few years show it to be a decreasing industry, as well as one causing some friction with the United States. In 1895 the catch by Canadian pelagic sealers was 78,614 seals; in 1896, 55,677; in 1897, 30,410; and in 1898, 28,552. Owing to the seizure of Canadian sealing vessels on the high seas, the contention that the United States were justified in making such seizures, and the repudiation of such claim by Great Britain, the question was submitted to an international commission sitting in Paris, with the result that a certain area (60 miles from shore) was prescribed round the sealing islands of Alaska in which pelagic sealing was forbidden, and damages to be settled by arbitration were awarded to the owners of vessels that had been unlawfully seized. This money was paid in 1899.

Commerce.—Since 1875 commerce has greatly expanded. The opening up of the fertile lands in the north-west, the increase of population, the discovery of new mineral fields, and the construction of railways have changed the conditions, methods, and channels

of trade. The development that has taken place may be seen from the figures in the following tabular statement:—

Year.	Total Exports.	Total Imports.	Entered for Consumption.	Duty.
	\$	\$	\$	\$
1880	87,911,458	86,964,747	71,782,349	14,138,849
1890	96,749,149	121,858,241	112,765,584	24,014,908
1900	191,894,723	189,622,513	180,804,316	28,889,110

The exports for the decades ending 1878, 1888, and 1898 are here shown:—

	1878.	1888.	1898.
	\$	\$	\$
Produce of the mines . . .	2,762,762	4,100,898	14,460,056
Fisheries	6,853,975	7,793,183	10,841,661
Forests	5,912,139 ¹	5,091,546 ¹	6,013,942 ¹
Animals and their produce	14,019,857	24,719,297	44,301,470
Agricultural	18,008,754	15,436,360	33,063,285
Manufactures	17,780,776	20,383,594	31,179,113
Miscellaneous	401,871	773,877	61,405
Coin, bullion, and short returns at inland ports	2,418,755	3,101,856	9,250,868

The largest items of this export trade for 1898 were: *Minerals*—gold, quartz, dust, &c., \$3,587,953; silver, \$3,519,786; lead, \$1,008,147; nickel, \$970,531. *Fisheries*—cod, \$2,595,005; lobsters, \$2,627,597; salmon, fresh and otherwise, \$3,624,212; mackerel, \$76,502. *Forest*—pine logs, \$1,616,671; spruce, \$33,885; all other logs, \$150,265. *Lumber*—pine deals, \$3,814,947; spruce and other deals, \$7,918,366; planks and boards, \$5,611,537. Square timber: white pine, \$1,536,067; red pine, \$59,687; others, \$28,882; and other products of wood, making a total of \$26,511,539. *Animals and their produce*—cheese, \$1,572,763; cattle, \$8,723,292; horses, \$1,497,444; sheep, \$1,272,077; butter, \$2,046,686; eggs, \$1,255,304; hides, skins, &c., not fur, \$1,072,028; bacon, \$7,291,285; besides many other articles reaching less than one million dollars' worth. *Agricultural products*—wheat, \$17,313,916 + \$5,425,760 wheat flour; oats, \$3,041,578; apples, \$1,431,517; pease, \$1,813,792, &c. *Manufactures*—agricultural implements, \$1,443,140; boots, shoes, and articles of leather, \$1,608,352; wood-pulp, \$1,210,421; other articles of wood, \$1,261,618. There is a large number of items in the export trade, but those are mentioned that exceed one million dollars.

Shipping.—The chief seaports from east to west are Halifax, N.S.; St John, N.B.; Quebec and Montreal on the Atlantic; and Vancouver, Esquimalt, and Victoria, B.C., on the Pacific. Halifax is the ocean terminus of the Intercolonial railway; St

John the Atlantic terminus, and Vancouver the Pacific terminus of the Canadian Pacific railway. Esquimalt is the harbour and depot of the British squadron on the Pacific, but it is little used by merchant vessels. There are four graving docks in Canada:—

	Length.	Width at Coping.	Entrance.	At Bottom.	Water on Sills.
	Feet.	Feet.	Feet.	Feet.	Feet.
Esquimalt, B.C.	430	90	65	41	26½
Kingston, Ont.	280	79	55	47	16
Quebec	445	100	62	78	25½
Halifax, N.S. . .	585	102	89½	72	30

There are 1532 light stations, lighthouses, fog-whistles, and automatic horns. Of late the character of the shipping interest has much changed, owing to the substitution of iron and steel for wood. Shipbuilding has decreased from 490 vessels built and registered in 1874, to 278 vessels built and registered in 1898; the tonnage built from 183,000 in 1874 to 24,522 in 1898, but the general increase of tonnage employed in transportation has been larger during the same period, as the following table shows:—

Sea-going Tonnage arriving at and leaving Canadian Ports.

Year.	British.	Canadian.	Foreign.	Total Tons Register.
1874	3,945,822 {	included in British	2,105,539	6,051,361
1898	5,777,068	2,029,745	4,778,672	12,585,485

In 1874 there was but one regular passenger steamship line between Great Britain and Canada; there are now four, with occasional less regular services. On the inland waters the tonnage of Canadian and American vessels arriving at and leaving Canadian ports has increased in the same period from 5,370,506 to 12,160,631 tons register, the Canadian in each case slightly preponderating. The tonnage engaged in the coasting trade increased in the twenty-four years from 8,700,000 tons to 29,700,000 tons.

Internal Communications.—The internal communications are carried on both by railway and canal, and in no particular has Canada undergone greater change than in her inter-provincial traffic. In 1878 there were 6143 miles of railway in operation, carrying 6,443,924 passengers and 7,883,472 tons of freight; in 1898 there were 16,718 miles in operation, carrying 18,444,049 passengers and 28,785,903 tons of freight. There are 166 railways, but an amalgamation of 25 of these constitutes the Grand Trunk railway system, and of 23 the Canadian Pacific railway system. These two systems, with the Intercolonial (owned and operated by the Government), are the three principal railways. A short line across Prince Edward Island is also owned by the Government. In 1898 the condition of the railways was thus:—

	Mileage.	Capital Paid Up.	Passengers Carried.	Freight in Tons.	Total Receipts.	Total Expenses.
		\$			\$	\$
Canadian Pacific	6,298	323,834,057	3,327,368	5,493,030	25,470,796	14,684,791
Grand Trunk	3,147	342,244,928	6,041,551	8,773,322	18,396,010	11,536,708
Intercolonial and Prince Edward Island	1,355	59,437,021	1,654,954	1,492,115	3,276,620	3,489,067
Total, all railways . . .	16,717	941,297,037	18,444,049	28,785,903	59,715,105	39,137,549

It will be seen that the Government has not had equal success with public companies in the management of railways, and that the Grand Trunk's receipts are not in the same proportion to their capital as those of the Canadian Pacific. The ordinary share capital of the railways is \$266,669,857; preference shares, \$111,481,933; bonded debt, \$354,946,866; together with aid from the Dominion and provincial Governments and other sources amounting to \$208,198,381, making the total capital \$941,297,037, exclusive of land grants given to the Canadian Pacific railway, the Calgary and Edmonton, and other prairie railways. Only one railway runs across the continent. The average cost per mile of completed railways has been \$55,797. There has been considerable development in the employment of electricity as a motive power in railways, especially in the cities and towns. In 1898 there were thirty-five electric railway companies which made returns. These showed that there were 635 miles of track, that 28,547,900 miles had been run during the year, and 94,616,344 passengers carried. Taking in the electric railways that failed to make full returns, the number of passengers carried by these railways is about 100,000,000.

Canals.—Despite the large increase in railway facilities, the waterways remain important factors in the transportation of the country. Though railways have to some extent supplanted water for internal passenger traffic, the great lakes and the St Lawrence

constitute the route of the bulk of the grain trade of the west to the seaports. The logs and a portion of the timber, as well as of sawn lumber of the Ottawa, Lower St Lawrence and New Brunswick are carried to their destination for the most part by water, and for these two trades the canals are a necessity; and in 1899 surveys were made with a view to connect the Georgian Bay arm of Lake Huron through the intervening water-stretches with the Ottawa river and its canals, and so to Montreal, the head of summer navigation on the Atlantic. On the great lakes route Lake Superior is connected with Lake Huron by canals round the rapids of Sault St Marie (two American, one Canadian lock). Lake Huron flows into Lake Erie by the St Clair and Detroit rivers, and this is connected with Lake Ontario by the Welland canal round Niagara (26½ miles), and between Lake Ontario and Montreal there are five canals. These canals have a depth of 14 feet on the sills. Up to the end of 1898 Canada had spent on the construction, renewal, and maintenance of canals \$160,075,900, of which \$87,571,498 had been taken from earnings, but the canals of the St Lawrence are regarded as public works of general utility, and are practically free of tolls. Of the total expenditure, \$20,692,244 was expended before confederation (1867), of which \$4,173,921 was supplied by the imperial Government. The increasing use of the canals is shown by the tons of freight carried in the two years 1888 (2,761,597 tons), and 1897 (8,560,969 tons), the difference being due mainly to grain from the west, American as well as Canadian vessels having to pass through the Welland canal to reach the ports on Lake Ontario.

¹ This does not include sawn and other manufactured timber which are classed as manufactures.

Postal.—Canada is one of the dependencies of Great Britain that adopted the 2 cents per $\frac{1}{2}$ oz. inter-imperial postage in force on 25th December 1898, and on 1st January 1899 the United States and Canada agreed to a uniform rate of 2 cents between the two countries. On the 1st June 1899 the internal rate of Dominion postage was reduced from 3 to 2 cents per oz. The growth of the postal business may be seen by comparing the estimated figures of the last two decades:—

Year.	Letters.	Post Cards.	Books, Circulars, &c.	Newspapers not from Office of Publication.	Parcels.	No. per Head.
1878	44,000,000	6,455,000	5,090,000	6,252,740	107,800	11.02
1888	80,200,000	16,586,000	17,810,000	10,850,000	763,900	18.22
1898	184,975,000	28,153,000	5,186,000 ¹	26,595,000	849,414 ¹	20.27

Telegraphs.—The telegraph lines are principally owned and operated by public companies, though the Government owns 2751 miles of land wire and 239 miles of cable which combined carry about 42,550 messages yearly. The bulk of the telegraph business is done by three companies, namely, the Canadian Pacific railway operating 8385 miles of wire, carrying in 1898, 1,650,000 messages; the Great North-Western, operating 18,228 miles, carrying 2,400,185 messages; and the Western Union (chiefly in the Maritime Provinces), 2935 miles, carrying 357,080 messages; the total being 29,548 miles, 4,407,265 messages. The telephone is in general use throughout the settled parts.

Banking.—The banking system has some peculiar features of its own, but is found to work admirably. Every chartered bank may issue notes to the extent of its unimpaired capital. It must hold 40 per cent. of its cash reserves in Dominion (Government) notes, and the shareholders are liable to the amount of twice that represented by the shares they hold. A person may call himself a banker, but may not call his business a bank or banking institution, unless duly chartered. A chartered bank, whether Canadian or otherwise, is required to deposit with the Government a sum of money, equal to 5 per cent. of its note circulation, to provide a fund for the redemption of the notes of any chartered bank that may suspend payment. On this amount it receives 3 per cent. per annum interest. When a bank fails, should its assets be insufficient to redeem its note issue—which is the first liability to be protected—the circulation redemption fund, or so much of it as may be necessary, is applied to redeem the notes, which until redeemed bear 3 per cent. interest. The banks are required to make the necessary arrangements to ensure the circulation of their notes at par, and are compelled to have agencies at the chief commercial city in each province for this purpose. The banks are required by law to make monthly returns to the finance minister, showing the condition of their business, and these are in due course published monthly in the official gazette. Once in every ten years the Banking Act is revised, for any amendments that experience may have shown to be necessary. There are 37 banks with 641 branches, besides unenumerated small private bankers in the lesser towns. The chartered banks had at the end of 1898 an aggregate paid-up capital of \$62,571,920, with an average for the year of \$37,873,934 in note circulation. Their liabilities were \$281,076,656, with assets \$370,583,991, a percentage of 75.86. The discounts given by the banks have steadily increased from \$175,000,000 in 1888 to \$245,670,000 in 1898. The reserve fund accumulated by the banks from earnings showed a total of \$27,955,807 at the end of 1898. Clearing Houses were established in Halifax in 1887, Montreal in 1889, Toronto in 1891, Winnipeg in 1893, St John in 1896, and in Victoria and Vancouver, B.C., in 1898. The largest amount of banking business is done in Montreal, which in 1898 showed \$731,264,677, or more than half of the whole clearings. Toronto comes next with \$439,489,336, Winnipeg \$90,754,276, Halifax \$62,523,827, Hamilton \$35,637,864, and St John with \$30,349,264.

Savings Banks.—There are four kinds of savings banks in Canada: (1) the Post Office savings banks; (2) the Government savings banks of the Maritime Provinces taken over at confederation and being gradually merged with the other; (3) two special savings banks in the cities of Montreal and Quebec; (4) the savings bank departments of the chartered banks. The rate of interest allowed by the Government is now 3 per cent. (it was higher), and the chartered banks usually follow the Government rate. The amount deposited in the Government savings banks during 1898 was \$14,121,630. The total amount of deposits held by the Government and the special savings banks at the end of the fiscal year 1898 was \$65,593,219. This does not include the savings departments of the chartered banks, their returns not specifying the deposits on savings bank account.

¹ Prior to this year some change of regulation as to parcels, &c., affects the comparison. The subsidies paid for carrying the mails in 1898 amounted to \$589,773.

Insurance.—The law governing insurance requires foreign fire insurance companies to deposit with the Government \$100,000 as a protection for their policyholders, and life insurance offices \$50,000. Canadian fire or life offices deposit \$50,000. On these amounts interest at the rate of 3 per cent. per annum is allowed. A license is granted by the Dominion, but some of the provinces further tax insurance companies doing business in the province by a license or registration fee of \$200 per annum. During 1898 there were 6 Canadian, 21 British, and 7 United States fire insurance companies doing business in Canada. The total amount of business done was \$680,160,689, and premiums charged thereon amounted to \$5,564,124. The total amount at risk on 31st December 1898 was \$895,394,107. Of life insurance companies there were 15 Canadian, 8 British, and 10 United States, besides several mutual assessment companies and 26 companies for miscellaneous insurance, such as accident, guarantee, plate glass, &c. In 1898, life policies in force amounted to \$368,523,982, against which latter business there was paid in death losses, endowments, dividends to policyholders, &c. \$6,782,006. Several of the fire insurance companies do an inland marine insurance business, but ocean marine insurance is confined to two Canadian companies.

Weights and Measures.—The legal weights and measures are the imperial yard, imperial pound avoirdupois, imperial gallon, and the imperial bushel. The imperial gallon is equal to 4.54174 litres; the wine gallon used in the United States being equal to 3.785 litres. The capacity of a bushel measure varies according to the article measured, and is fixed by Act of parliament. In contracts a bushel measure, unless otherwise specially provided in the contract, means, of wheat 60 lb; indian corn, 56 lb; rye, 56 lb; peas, 60 lb; barley, 48 lb; malt, 36 lb; oats, 34 lb; beans, 60 lb; flax seed, 56 lb; hemp, 44 lb; blue grass seed, 14 lb; lime, 80 lb; castor beans, 40 lb; potatoes, 60 lb; turnips, 60 lb; carrots, 60 lb; parsnips, 60 lb; beets, 60 lb; onions, 50 lb; bituminous coal, 70 lb; clover seed, 60 lb; timothy seed, 48 lb; buckwheat, 48 lb. The statute fixing these weights abolished the English hundredweight of 112 lb, and the ton of 2240 lb, and declared the ton to be 2000 lb avoirdupois and the hundredweight 100 lb, thus assimilating the weights of Canada and the United States, a change of great convenience in view of the railway and other interchange of freights.

Public Lands.—The public lands are owned and administered by the several provinces, except in Manitoba, the North-West Territories, and in the railway belt of British Columbia. These are under the control of the Dominion. The public or "Crown" lands of the Dominion are open to actual settlers free, under certain conditions of settlement and the payment of a nominal registration fee. The mining rights in such lands, however, are reserved and are dealt with under different regulations. Large grants of Crown lands have from time to time been made to railways, and these are sold to settlers on liberal terms of deferred payments. Public lands are surveyed on the rectangular system in sections of 1 square mile each, with an allowance for roads, and these are again divided into quarter sections of 160 acres each—the amount a settler is allowed to enter free. Two sections in each township of 6 miles square are reserved for school purposes, i.e., the proceeds of their sale belong to the school funds.

AUTHORITIES.—The annual reports to the Governor-General (blue books) of the several departmental ministers, and the census returns, together with the sessional papers or any particular subject, supply detailed information on the matters with which they deal. Amongst these are the trade and navigation returns, the public accounts, public works, railways and canals, fisheries, &c., but comprising the gist of all publications of the kind is the *Statistical Year Book of Canada*, and *Forest Wealth of Canada*, by GEORGE JOHNSON, Statistician of the Dominion, Ottawa, and the various reports and publications of the geological survey of the Dominion. For tides, currents, mean sea-level and the bore on the Bay of Fundy, see Reports of Marine Department 1894 to date, also *Trans. Royal Soc. Can.* vol. iii. sect. 3, p. 51. Amongst non-official publications are the *Handbook of Canada*, 1897 (Toronto); J. G. BOURNOR's *Manual of the Constitution of Canada* (London, 1895); G. BRYCE's *Manitoba* (London, 1882); W. KINGSFORD's *History of Canada*, 9 vols. (London, 1887-98); CANON MOCKRIDGE's *The Bishops of the Church of England in Canada and Newfoundland* (Toronto, 1897); A. J. MORGAN's *Canadian Parliamentary Companion* (1897); *Dominion Annual Register and Review* (Ottawa, 1878-97); G. R. PARKIN, *The Great Dominion* (London, 1895). PARKMAN's Works—*Pioneers of France in the New World*, *The Old Régime in Canada*, *Montcalm and Wolfe*, *The Jesuits in North America in the 17th Century*, *Count Frontenac and New France under Louis XIV.* (London, 1885); WARBURTON PIKES's *Barren Grounds of Northern Canada* (London, 1896); A. R. SELWYN's and G. M. DAWSON's *Descriptive Sketch of the Physical Geography and Geology of the Dominion of Canada* (Montreal, 1854); A. B. WILLMOTT's *Mineral Wealth of Canada* (London, 1897); BECCLES WILLSON's *Great Company* (the A. B. C.'s) (Toronto, 1899). (M. ST. J.)

AGRICULTURE.

About 42 per cent. of the population of Canada belong to families whose heads or members are engaged in agriculture. A large number more are employed in industries arising out of agriculture; among these are millers of flour and oatmeal, curers and packers of meat, makers of cheese and butter, and persons occupied in the transportation and commerce of grain, hay, live stock, meats, butter, cheese, milk, eggs, fruit, and various other products. It is estimated that the annual value of all farm crops and products in Canada is not less than 600,000,000 dollars. The country is splendidly formed for the production of food. Across the continent there is a zone about 3500 miles long and nearly as wide as France, with a climate adapted to the production of foods of superior quality. In places which are now cultivated the soil has been found fertile. That of Manitoba is rich in the constituents of plant food to a degree that surpasses nearly all the soils of Europe. The freezing of the soil in winter, which at first sight seems a drawback, retains the soluble nitrates which might otherwise be drained out. The geographical position of Canada, its railway systems and steamship service for freight across the Atlantic, are favourable for the extension of the export trade in farm products to European countries.

Of wheat many varieties are grown. The methods of cultivation do not involve the application of so much hand labour per acre as in Europe. The average yield of spring wheat in the

Crops. province of Manitoba has varied from about 17 bushels per acre to 25 bushels per acre. The average yield of fall or winter wheat in the province of Ontario since 1883 has been 20 bushels per acre. As a rule the weather during the harvesting period permits the grain to be gathered safely without any damage from sprouting. Suitable machinery for cleaning the grain is everywhere in general use, so that weed seeds are removed before the wheat is ground. This gives Canadian wheat excellent milling properties, and enables the millers to turn out flour uniform in quality and of high grade as to keeping properties. Canadian flour has been steadily gaining ground in European markets. It is becoming known as flour from which bakers can make the best quality of bread, and also the largest quantity per barrel, the quantity of albuminoids being one-tenth greater in Canadian flour than in the best brands of European. In three tests by a leading firm of London bakers, Canadian flour gave 146 lb, 152 lb, and 151 lb of bread of excellent quality from 100 lb of flour, a better result than could be obtained from any other flour imported into the United Kingdom. There are not less than 2500 flour mills, employing over 6000 men. There is room for a great extension in the cultivation of wheat and the manufacture and exportation of flour. By the growing of crops of clover alternately with wheat one main constituent (nitrogen) required in the soil to keep it fertile may be renewed perpetually. There are many millions of acres of fertile land suitable for wheat culture unoccupied. The yield of wheat in Canada for 1901 was estimated at 85,000,000 bushels. If the area of available land only be considered, the yield might be ten times greater per annum, with plenty of fertile land still awaiting cultivation. Oats of fine quality are grown in large crops from Prince Edward Island on the Atlantic coast to Vancouver Island on the Pacific coast. The Canadian soil and climate are admirably adapted for producing oats of heavy weight per bushel, with thin husk. Canadian oatmeal is equal in quality to the best. It is prepared in different forms, and in various degrees of fineness; also as "rolled oats" and "oat flakes." As a rule, the weather is favourable for both the growth and harvesting of the crop. Consequently, oats and oatmeal do not become bitter from sprouted grain, or musty from the heating of the straw in stacks. Peas in large areas are grown free from serious trouble with insect pests. Split peas for soup, green peas as vegetables, and sweet peas for canning are obtained in perfection. Barley was formerly grown in enormous quantities for export to the United States for malting purposes. After the raising of the duty on barley under the McKinley and Dingley tariffs that trade fell off. Some varieties are cultivated with success for the making of pearl or pot barley. Rye is cultivated successfully, but is seldom used as food by the people. Flour from wheat, meal from oats, and meal from Indian corn are preferred. Buckwheat flour is used in considerable quantities in some districts for the making of buckwheat cakes, eaten with maple syrup. These two make an exquisite breakfast dish, characteristic

of Canada and some of the New England states. There are also numerous forms of preparations from cereals, sold as breakfast foods, which, owing to the superiority of the grains grown in Canada and the care exercised in their manufacture, compare favourably with similar products in other countries.

Vegetables are grown everywhere, and form a large part of the diet of the people. There is a comparatively small export, except in the case of potatoes and vegetables which have been canned or dried. Besides potatoes, which thrive well and yield large quantities of excellent quality, there are turnips, carrots, parsnips, and beets. The cultivation of sugar beets for the manufacture of sugar has been begun in Quebec, Ontario, and Alberta. Among the common vegetables used in the green state are peas, beans, cabbage, cauliflowers, asparagus, Indian corn, onions, leeks, tomatoes, lettuce, radish, celery, parsley, cucumbers, pumpkins, squash, and rhubarb. Hay, of good quality of timothy (*Phleum pratense*), and also timothy and clover, is grown over extensive areas. For export it has been put up in bales of about 150 pounds each. Since 1899 a new form of pressing has been employed, whereby the hay is compressed to stow in about 70 cubic feet per ton. This has been a means of reducing the ocean freight per ton. The compact condition permits the hay to be kept with less deterioration of quality than under the old system of more loose baling. Austrian Brome grass (*Bromus inermis*) is grown for hay extensively in Manitoba and the North-West Territories.

The breeding of horses has been to some extent neglected since the use of electrical power became general. Heavy draught horses of the Clydesdale breed are reared principally in the Live stock provinces of Ontario and Quebec. Horses suitable for general work on farms, and for omnibuses, and grocery and delivery waggons, are plentiful for local markets and for export. Useful carriage horses and saddle horses are bred in a few localities, and animals for cavalry and mounted infantry remounts are produced in all the provinces and in the North-West Territories. Thoroughbred stallions of all breeds are kept by private individuals and by agricultural societies. There are no Government stud farms.

Cattle, sheep, swine, and poultry are reared in abundance. The bracing weather of Canadian winters is followed by the warmth and humidity of genial summers, under which crops grow in almost tropical luxuriance, while the cool evenings and nights give the plants a robustness of quality which are not to be found in tropical regions, and also make life for the various domestic animals wholesome and comfortable. In the North-West Territories there are vast areas of prairie land, over which cattle pasture, and from which thousands of fat bullocks are shipped annually. Throughout other parts bullocks are fed on pasture land and also in stables on nourishing and succulent feed such as hay, Indian corn fodder, Indian corn ensilage, turnips, carrots, mangels, ground oats, barley, peas, Indian corn, rye, bran, and linseed oil cake. The breeding of cattle, adapted for the production of prime beef, has received much attention. There is Government control of the spaces on the steamships in which the cattle are carried, and veterinary inspection to prevent the exportation of any animals that might be affected with disease. In recent years a trade has been growing up in the exportation of dressed beef in cold storage, and also in the exportation of beef preserved in hermetically sealed tins. Sheep thrive well on the hill pastures, and mutton and lamb of fine flavour are plentiful. Swine are reared and fattened in large numbers. The export trade in bacon grew rapidly between 1890 and 1900. Canadian hogs are fed, as a rule, on feeds suited for the production of what are known as "fleshy sides." Bacon with an excess of fat is not wanted, except in the lumber camps; consequently the farmers of Canada have cultivated a class of swine for bacon having plenty of lean and firm flesh. The great extension of the dairy business has fitted in with the rearing of large numbers of swine. Experimental work has shown that swine fattened with part of a ration of skim-milk were luster and of a more healthy appearance than swine fattened wholly on grains. Slaughtering and curing are carried on chiefly at large packing-houses. The use of mechanical refrigerating plants for chilling the pork has made it practicable to cure the bacon with the use of a small percentage of salt, leaving it mild in flavour when delivered in European markets. Regular supplies are exported during every week of the year. Large quantities of lard, brawn, and pigs' feet are exported, and there is a growing trade in "lunch tongues." Turkeys thrive well, grow to a fine size, and have flesh of tender quality. Chickens are raised in large numbers, and of late years farmers have adopted the method of fattening them a few weeks before they are killed, thus increasing the proportion of edible material. Canadian eggs are usually packed in cases containing thirty dozens each. Cardboard fillers are used which provide a separate compartment for each egg. There are cold storage warehouses at various points in Canada, at which the eggs are collected, sorted, and packed before shipment. These permit the eggs to be landed in Europe in a practically fresh condition as to flavour, with the shells quite full.

Canada has been called the land of milk and honey. *Milk* is plentiful, and enters largely into the diet of the people. The healthy condition of the cows, the pure air of the country, and the cleanly habits of the people ensure the wholesome quality of the milk. There is no export trade in milk, but large quantities are now put up in hermetically sealed tins as condensed milk, for use in mining camps and on board steamships. The *cheese* is chiefly of a variety known as "Canadian Cheddar." It is essentially a food cheese rather than a mere condiment. 1 lb of it will furnish as much nourishing material as 2½ lb of the best beefsteak. The industry is largely carried on by co-operative associations of farmers.

The number of cheese factories and creameries grew from 1733 in the year 1891 to 3649 in the year 1899. *Butter* for export is now made in creameries, where the milk, cream, and butter are handled by skilled makers. The creameries are provided with special cold storage rooms, into which the butter is placed on the same day in which it is made. From them it may be carried in refrigerator railway cars and in cold storage chambers on steamships to its ultimate destination. For the export trade it is packed in square boxes made of spruce or some other odourless wood. These are lined with parchment paper, and contain each 56 lb net of butter. The export trade of butter increased over seven-fold in six years, after cold storage facilities for its safe carriage were arranged for by the Government.

In all settled districts of Canada lying eastward of the Great Lakes and westward of the Rocky Mountains apples of fine quality in flavour, in substance, in colour, and in size can be grown; and in areas containing hundreds of square miles, pears, peaches, and grapes are grown in quantities in the open air. The climate is favourable to the growth of small fruits, such as plums, cherries, strawberries, raspberries, currants, gooseberries, and there are great areas in which cranberries, blackberries, and blueberries grow plentifully.

Apples and pears are the chief sorts of fruit exported. The high flavour, the crisp, juicy flesh, and the long-keeping qualities of the Canadian apples are their chief merits. The comparatively tender, but very dainty and highly-flavoured "Famense" and "Gravenstein" varieties were exhibited in cold storage at the Paris Universal Exposition of 1900 during the summer succeeding the one in which they were grown. Apples are exported in barrels, and also in boxes containing about one bushel each. Large quantities are also evaporated and exported. Establishments for evaporating fruit are now found in most of the larger apple-growing districts, and canning factories and jam factories have been established in many parts of Canada, and are conducted with advantage and profit. In 1899 eight million pounds of evaporated apples were exported, largely to tropical countries.

Wine is made in considerable quantities in the principal vine-growing districts, and in several localities large vineyards have been planted for this purpose. An abundance of *cider* is also made in all the large apple-growing districts.

Honey is one of the minor food products of Canada. With clover blossoms perfuming the air for hundreds of miles, honey bees have plenty of pasturage. It is everywhere admitted that Canadian honey for colour, flavour, and substance is unsurpassed. *Maple sugar and syrup* are made in those areas of the country where the maple tree flourishes. The syrup is used chiefly as a substitute for jam or preserved fruits, and the sugar is used in country homes for sweetening, for cooking purposes, and the making of confectionery. During recent years the processes of manufacture have been improved by the introduction of specially constructed evaporators, and quantities of maple sugar and syrup are now available for the export trade.

The Department of Agriculture of the Federal Government renders aid in various ways. Chief among these are the maintenance of the branches of the public service under *State aid*. the Commissioner of Agriculture and Dairying, and the Dominion Experimental Farms. Under the former the Government promotes the extension of markets for farm products; it maintains several officers in the United Kingdom who make reports from time to time on the condition in which Canadian goods are delivered from the steamships, and also on what they can learn from importing and distributing merchants regarding the preferences of the market for different qualities of farm goods and different sorts of packages. Through this branch of the public service a complete chain of cold storage accommodation between various points in Canada and markets in Europe, particularly in Great Britain, has been arranged. The Government offered a bonus to those owners of creameries who would provide cold storage accommodation at them and keep the room in use for a period of three years. It also arranged with the various railway companies to run refrigerator cars weekly on the main lines leading to Montreal and other export points. The food products from any shippers are received into these cars at the various railway stations at the usual rates, without any extra charge for the icing or cold storage service. The Government

offered subventions to those who would provide cold storage warehouses at various points where these were necessary, and also arranged with the owners of ocean steamships to provide cold storage chambers on them by means of mechanical refrigerators.

Information is given to farmers regarding the various breeds of horses, cattle, sheep, swine, and poultry which have been found most suitable for different districts, most profitable for keeping, and best adapted for the various markets to which they or their products can be sent. Besides furnishing technical and general information on the carrying on of dairying operations, the Government has established and maintained illustration cheese factories and creameries in different places for the purpose of introducing the best methods of carrying on co-operative dairying in both the manufacturing and shipping of butter and cheese. Inspectors are employed to give information regarding the packing of fruit, and also to see to the enforcement of the Fruit Marks Act, which prohibits the marking of fruit with wrong brands and packing in any fraudulent manner.

Experimental farms were established in 1887 in different parts of the Dominion, and were so located as to render efficient help to the farmers in the more thickly settled districts, and at the same time to cover the most varied climatic and other conditions which influence agriculture in Canada. The Central Experimental Farm is situated at Ottawa, near the boundary line between Quebec and Ontario, where it serves as an aid to agriculture in these two important provinces. One of the four branch farms has been placed at Nappan, Nova Scotia, near the boundary between that province and New Brunswick, where it serves the farmers of the three maritime provinces. A second branch experimental farm has been established at Brandon, in Manitoba; a third at Indian Head, in Eastern Assiniboia, one of the North-West Territories; and the fourth at Agassiz, in the coast climate of British Columbia. At all these farms experiments are conducted to gain information as to the best methods of preparing the land for crop, and of maintaining its fertility, the most useful and profitable crops to grow, and how the various crops grown can be disposed of to the greatest advantage. To this end experiments are conducted in the feeding of cattle, sheep, and swine for flesh, the feeding of cows for the production of milk, and of poultry both for flesh and eggs. Experiments are also conducted to test the merits of new or untried varieties of cereals and other field crops, of grasses, forage plants, fruits, vegetables, plants, and trees; and samples, particularly of the most promising cereals, are distributed freely among farmers for trial, so that those which promise to be most profitable may be rapidly brought into general cultivation. Annual reports and occasional bulletins are published and widely distributed, giving the results of this work. Farmers are invited to visit these experimental farms, and a large correspondence is conducted with those interested in agriculture in all parts of the Dominion, who are encouraged to ask advice and information from the officers of the farms.

The governments of the several provinces each have a department of agriculture. In Ontario, Quebec, and Nova Scotia there are special agricultural schools or colleges for the practical education of young men in farming; there are also dairy schools in most of the provinces, where practical instruction and training are given. Among other provincial agencies for imparting information there are farmers' institutes, travelling dairies, live-stock associations, farmers', dairymen's, and fruit-growers' associations, and agricultural and horticultural societies. These are all maintained or assisted by the several provinces. Parts of the proceedings and many of the addresses and papers presented at the more important meetings of these associations are published by the provincial governments and distributed free to farmers who desire to have them. There are also annual agricultural exhibitions of a highly important character, where improvements in connexion with agricultural and horticultural products, live stock, implements, &c., are shown in competition. The principles of agriculture are taught to some extent in the common schools in most of the provinces. Sir William C. Macdonald of Montreal recently gave a sum of 10,000 dollars to be distributed to boys and girls on Canadian farms as prizes in a competition in the selection of seed grain. The competitors grew seed grain on specially prepared plots of land, one-quarter of an acre in each plot, selecting seed each year from these plots to sow on the plot for the succeeding year. They gathered the large well-filled heads from vigorous plants before the grain was cut, after all the conditions of growth had been observed, and then threshed these heads. By screening and hand-picking the large well-developed grain from those selected heads, the seed for next year's seed grain plot was secured. The selecting of seed in this manner was conducted on over 800 Canadian farms, fairly well distributed throughout the Dominion, and was of immense benefit to agriculture. Sir William gave a further sum of 225,000 dollars for the improvement of education at rural schools.

(J. W. R.)

HISTORY (*since Confederation*).

The four provinces of Ontario, Quebec, New Brunswick, and Nova Scotia were confederated as the Dominion of Canada in 1867. At the request of the Dominion parliament the territory ruled by the Hudson Bay Company was ceded to Canada by the imperial Government in 1870, on the payment of \$300,000 to satisfy the Company's claims. From a portion of this territory the province of Manitoba was immediately formed, though it became necessary to quell by military force a rebellion among the half-breeds of the Red River district before the Dominion could finally take possession of the country. In the following year (1871) British Columbia joined the Dominion, the chief condition of the union being that a railway should be built within ten years to connect the Pacific coast with the eastern provinces. In 1873 Prince Edward Island entered the confederation. The Nelson River country to the west of Hudson Bay was in 1876 formed into the district of Keewatin. In the year 1880 all the remaining British possessions on the continent, except Newfoundland and the dependent district of Labrador, were formally annexed to Canada. Two years later the provisional districts of Assiniboia, Saskatchewan, Alberta, and Athabasca were created, and Regina was fixed upon as their capital. It was not till 1895 that the great unorganized tract to the north and west was divided into four districts—Ungava, Franklin, Mackenzie, and Yukon.

The problems with which the statesmen of confederated Canada have had to deal in connexion with the vast territory thus brought under their control have been numerous and of varied character. Immediately after confederation a serious agitation for repeal of the union arose in Nova Scotia, which had been brought into confederation by a vote of the Legislature, without direct appeal to the people; this danger was only averted after much negotiation, and considerable modification of the terms on which that province entered the Dominion. Much friction has arisen in defining accurately the division of power between the Federal and provincial Governments. The founders of confederation had, in the troubles of the United States, an object-lesson on the necessity of strengthening the central authority. The American constitution, after clearly defining the powers of the Federal Government, leaves all unstated authority to the sovereign states. Canada adopted the opposite course. While the range of legislative control for the province was clearly defined, the residuum of undelegated authority was given to the Federal Government. On this point several differences have arisen, the Dominion sometimes disclaiming, sometimes asserting, a right to interfere. When, in 1871, the New Brunswick legislature passed a Bill making public education non-sectarian, the opposition, on behalf of the Roman Catholic minority, appealed to the Ottawa Government to disallow the Act. This it refused to do, asserting that the province had acted within its rights. A similar policy was followed in 1888, when the Quebec legislature granted to the Jesuit order a sum of \$400,000 in compensation for property forfeited to the Crown. The Dominion Government, urged to disallow this Act, ruled that it did not come within its jurisdiction. A difference of long standing was settled in 1898 by the Privy Council, which ruled that in the question of the control of fisheries, while the Dominion had exclusive power to make regulations, the issue of licenses and the collection of revenues from this source belong to the provinces, except in the case of Manitoba and the North-West Territories, where no prior rights existed. In 1878 the Federal Government passed the Scott Act, empowering municipalities to deal with the traffic in liquor. The right of the Federal parliament to pass this Act was questioned

as an infringement of provincial powers, but on appeal to the Privy Council the right was maintained. It seems probable that most of the possible questions of difference between federal and provincial authority have now been settled by these and similar judicial decisions, and that Canadian experience in adapting a federal system to British methods of government will prove extremely useful in further applications of the federal idea to other parts of the empire, or to the empire itself. In this connexion it may be noted that dual representation, or the privilege of representing a constituency in the Dominion parliament and in a provincial assembly at the same time, was tried in the early years of confederation, but was abolished in 1872 as unsatisfactory.

Among matters demanding constructive legislation in the organization of the new state the following may be noted:—In 1871 a uniform system of *decimal currency* was established for the whole Dominion. The creation of a *Supreme Court*, after engaging the attention of the Canadian parliament for several years, was finally accomplished in 1876. This court is presided over by a chief justice and five puisne judges, and has appellate civil and criminal jurisdiction for the Dominion. By an Act passed in 1891 the Government has power to refer to the Supreme Court any important question of law affecting the public interest. The right of appeal from the Supreme Court thus constituted to the Judicial Committee of the Privy Council marks, in questions judicial, Canada's place as a part of the British empire. The appointment, first made in 1897, of the chief justices of Canada, Cape Colony, and South Australia, as colonial members of the Judicial Committee, still further established the position of that body as the final court of appeal for British people. The British North America Act of 1867 provided that the control of *elections for the Dominion parliament* should rest with the various provinces. This measure was necessary owing to the lack of machinery at the time for managing federal matters. This clause was superseded in 1885 by a franchise Bill, which provided for uniformity of suffrage and recognized property qualification as determining the right to vote. A later Act, passed in 1898, restored the provincial franchise as the basis for federal elections, thus reintroducing an element of variety in the qualifications of voters. Ontario, Manitoba, British Columbia, and Prince Edward Island have practically manhood suffrage; in Quebec, Nova Scotia, and New Brunswick a property qualification is required. A general election law was passed in 1874, which provided for vote by ballot, the holding of elections simultaneously throughout the Dominion, and the abolition of property qualification for members of parliament. In the North-West Territories, however, elections were held by open voting until 1885. In a country of vast distances with great areas to be opened for settlement, *railway development* was necessarily from the first a leading question of public policy. Two great national lines were projected as an essential part of confederation: the Intercolonial, built to connect the Maritime Provinces with the provinces on the St Lawrence; the Canadian Pacific to unite the Atlantic and the Pacific coasts of the Dominion. The first of these was completed in 1876; with the various extensions since built it now includes 1511 miles of road, and remains entirely under the control of the Government. The construction of the Canadian Pacific was entrusted to a private company, which received large subsidies of land, money, and completed railway. This system has grown to be one of the greatest in the world; it owns more than 7000 miles of road and controls about 3000 more; in its various ramifications it touches the most important points of Canada; it has established steamship communication with Japan and along the great lakes. The railway mileage of the whole Dominion

has grown from 4022 in 1874 to 17,250 in 1899; and new lines are still being built as new areas become settled. The question of subsidizing railways has at various times profoundly affected the politics of the country. The completion of the Canada Pacific railway, and the consequent opening-up of the prairie lands of the north-west, have been followed by a considerable increase in immigration. But at no time has this been excessive, nor is any foreign nation represented by numbers sufficiently large to prevent ultimate fusion with the English-speaking element. A considerable migration has lately taken place into the north-west from the western states of America. The exodus from Iceland, begun in 1875, has resulted in greatly decreasing the population of that island. In Southern Manitoba are settled large numbers of Menonites, a thrifty and honest if somewhat exclusive folk, who fled from Europe to escape military service. For a similar reason the Doukhobors (*q.v.*), a peculiar religious sect from the Black Sea provinces of Russia, in 1899 emigrated to Canada in a body. Scottish crofters from the Highlands, English and Irish agricultural labourers, Americans, Norwegians, Galicians, and Danes, help to swell a varied but hardy and industrious population. The district of Alberta is largely occupied by Englishmen who are engaged in ranching. On the Pacific slope the Chinese, though discouraged by a heavy tax, are found in considerable numbers, while the influx of Japanese coolies is creating a problem in the labour market of British Columbia. On confederation Canada assumed the care of her own land defences. The Fenian raids of 1866 and 1870 delayed for a short time the removal of imperial regiments, but in the latter year all British forces were withdrawn except those stationed at Halifax. During the war in South Africa (1899-1902) these, too, were temporarily replaced by a Canadian garrison. On the other hand, within the last few years the imperial and the Canadian Governments have entered into an agreement for the joint defence of Esquimalt, a new coaling and naval station on the Pacific coast. By the Militia Act of 1868 and 1883 the Canadian militia is divided into three classes—the permanent, the active, and the reserve. The permanent force includes about 1000 men, exclusive of the garrison at Halifax. There is also a corps of North-West Mounted Police, numbering about 1000. The active Militia numbers 45,000 men, whose term of service is three years, and who drill for two weeks each year; while the Reserve includes all the remaining male citizens between the ages of sixteen and forty-five. The officer commanding the militia is appointed from the imperial army. A military college was established at Kingston in 1875, and in this officers are trained for both the Canadian and imperial services. Several commissions are given each year to selected candidates by the British Government, and a considerable proportion of the graduates of the college are now serving in the imperial army. The military forces of Canada were called upon to repel the Fenian attacks of 1866 and 1870, and to put down the insurrection of half-breeds in the north-west in 1885. The contribution made by Canada of two contingents of troops for service under imperial direction in South Africa is the most important military event in the later history of the Dominion. The forces sent by the Dominion were supplemented by a body of horse raised in North-Western Canada, and equipped and paid by a Canadian, Lord Strathcona. The sea fisheries, which are so important a source of wealth for Canada, have been the cause of no little international difficulty. With the termination of the Reciprocity Treaty of 1866 all American rights to fish in Canadian waters came to an end, but in spite of this American fishing schooners continued to carry on operations within the three-miles limit.

Several were seized and confiscated, to the annoyance of New England fishermen. The joint commission, which met at Washington in 1871 to settle points of dispute between Great Britain and the United States, decided that Americans should be allowed to fish in Canadian waters on payment of an indemnity to be fixed by a later treaty. A commission met at Halifax six years afterwards to decide the amount of this indemnity, and awarded to Canada the sum of \$5,500,000, which was paid with some reluctance. But in 1885 the fisheries clauses of the Washington treaty were terminated by the Americans themselves; a new treaty, signed at Washington in 1888, was rejected by the United States Senate, and fishing is now carried on by the Americans under a *modus vivendi* which provides for the payment of licenses. A dispute, arising out of the seizure by the Americans of several Canadian vessels engaged in the seal fishery in Bering Sea, was, in 1892, referred to a board of arbitration, which decided in favour of Canada, and awarded to the owners of these vessels damages to the amount of \$464,000. This sum was paid in 1898. At the same time agreements were entered into for the future conduct of the seal fishery, with a view to preventing further disputes. The discovery of new *mineral deposits*, and the development of others previously known, have during the last few years given a great stimulus to Canadian prosperity. From the Yukon field alone there was taken in 1899 gold to the value of \$16,000,000, while the gold output of the whole country increased from \$1,000,000 in 1894 to \$21,000,000 in 1899. A large area of country in southern British Columbia has proved extremely rich in gold, silver, and copper; large mining towns have sprung up with great rapidity; much capital has found profitable investment; several hundreds of miles of railway have been built to meet the needs of the increasing population; and this mining population has furnished a new and profitable market for the products of western farming. New and very extensive coal deposits, lately opened up in the Crow's Nest Pass, supplement and add to the value of other mineral discoveries. In the extreme east extensive ironworks have been constructed at Sydney, Cape Breton. Both here and in Nova Scotia the existence of iron ore, coal, and flux, within easy reach of each other, offers exceptional opportunities for the cheap production of iron and steel on a large scale. The most important nickel deposits yet discovered in the world are at Sudbury, in Ontario; and steps have been taken to increase the already large output of this metal.

Trade Policy.—Questions of trade policy have divided public opinion in Canada more deeply than almost any other. This arises from very exceptional trade relations. The chief commerce of the Dominion is carried on with two countries—Great Britain and the United States—of which the one has followed a free trade and the other a highly protectionist policy. Until 1866 Canada enjoyed great prosperity under a Reciprocity Treaty with the United States. In that year the treaty was abrogated, apparently with the intention of checking Canadian trade and fostering a desire for annexation. In the next seven years, however, the trade of Canada almost doubled, the opening of new markets in the West Indies and Europe having given new outlets for her products. Then followed a period of commercial depression without parallel in Canadian history. Manufactures languished, the agricultural classes were in great need, and the revenues of the country showed increasing deficits. Meanwhile the highly-protected industries of the United States offered a field for labour which drew thousands of Canadians over the border. Hence arose a keen conflict of opinion. It was urged, on the one hand, that a free trade policy would

leave the country at the mercy of the United States. On the other, it was claimed that protection would weaken the connexion with the mother country. In 1878 a protective policy was adopted by a popular vote. It had the effect of checking the exodus and restoring the national credit. With the return of prosperity, and the establishment of the finances on a sound basis, there arose a strong feeling that some discrimination should be made in favour of Great Britain as against foreign countries with their high tariffs. This feeling took definite shape in 1897, in the adoption of a preferential tariff in favour of British goods to the extent of 25 per cent. less than that levied on goods from foreign countries. This preference has now been increased to 33½ per cent.

Science.—In scientific research and achievement Canada has made much progress. This is particularly true of medical science, owing to the establishment of important medical schools in the principal university centres. The munificence of the wealthy citizens of Montreal has given to that city a school of practical science, with an equipment unrivalled perhaps in the world. Schools of the same character have been founded in Toronto and Kingston, and the Royal Military College also provides a course in civil and military engineering. The skill and energy of the Canadian engineer find ample room for exercise in the development of the country's mining resources, and in the construction of canals and railroads. The wide application of electrical energy has been especially marked. Every town of any importance has its electric street railway, its system of electric lighting, its supply of electric power for manufacturing purposes; its telephone connexion not only throughout its own area, but with places hundreds of miles away. Even the rural districts are becoming accustomed to look upon the telephone wire as a necessity. Every new labour-saving invention is quickly adopted, for skilled labour in Canada is still scarce and dear. Improved agricultural machinery has greatly lightened the burdens of the farmer, and Canadian implements of this class have secured a special reputation and market for themselves in other countries, owing to their lightness and durability. Twice since confederation has the British Association for the Advancement of Science selected Canadian cities for its annual meetings, thus furnishing a striking illustration of the contraction of the empire under the influence of steam and electricity.

Literature.—In the domain of letters, though no great names have appeared, Gilbert Parker, Charles Roberts, Bliss Carman, W. W. Campbell, Archibald Lampman, and a few other Canadians have in prose and verse interpreted their native land and its conditions with marked distinction. In 1880 the verse of Louise Frechette, the French Canadian poet, was crowned by the French Academy. Dr Drummond's dialect verse, embodying the speech and thought of the French *habitant*, has gained a wide popularity. Dr Goldwin Smith, who made his home in Toronto in 1871, and has issued thence several volumes of history and criticism, speaks of himself as a Canadian, and has devoted no small share of his time and his consummate mastery of English prose to Canadian journalism. Sir John Bourinot, Sir James Lemoine, Dr Kingsford, and the Rev. Abbé Casgrain have been chief among many laborious workers in the field of Canadian history. The Royal Society, founded in 1882, draws together at its annual meetings men of literature and science, and publishes each year a volume of transactions.

Education.—On confederation the control of education was entrusted to the provinces, with a stipulation that all rights then enjoyed by denominational schools should be respected. This has given rise to considerable diversity of management, though in all the provinces education

is free, and the necessary funds are obtained from local taxation and Government grants. Ontario has a highly-organized school system, directed by a minister of education, who is a member of the provincial cabinet. The other provinces have superintendents and boards of education, who report to the provincial legislatures. In Quebec, where religious instruction is still considered the basis of education, most of the schools are controlled by the local Roman Catholic clergy. In Nova Scotia, New Brunswick, Prince Edward Island, Manitoba, and British Columbia the public schools are strictly undenominational; in Ontario and Quebec separate schools are allowed to Roman Catholics and Protestants. Education of children between the age of seven and thirteen is compulsory except in Quebec. Secondary education is provided for by high schools and collegiate institutes in all towns and cities. Each province has a number of normal and model schools for the training of teachers. For higher education there are also abundant facilities. While the older universities have increased greatly in influence and efficiency, the following new foundations have been made since confederation:—University of Manitoba, Winnipeg, 1877; Presbyterian College, Winnipeg, 1870; Methodist College, Winnipeg, 1888; Wesleyan College, Montreal, 1873; Presbyterian College, Montreal, 1868; School of Practical Science, Toronto, 1877; Royal Military College, Kingston, 1875; M'Master University, Toronto, 1888. All the larger universities have schools of medicine in affiliation, and have the power of conferring medical degrees. Since 1877 Canadian degrees have been recognized by the Medical Council of Great Britain. In her treatment of the Indians Canada has met with a success which is in marked contrast to the experience of the United States. Since indiscriminate slaughter deprived them of the bison, their natural means of subsistence, the north-west tribes have been maintained chiefly at the expense of the country. As a result of the great care used in watching over them, the last few years have shown a small but steady increase in their numbers. A most encouraging sign of the elevation of the Indian is the increasing interest taken by them in education. A system of industrial and boarding schools has been established in several of the provinces, and these, by separating the children from the degrading influences of their home life, have proved much more effectual than day schools in training them in the habits and ideas of a higher civilization. A tendency towards consolidation has been evident among the various religious bodies. In 1873 the different branches of the Presbyterians united under the name of the Presbyterian Church of Canada, and a similar step was taken by the Methodists in 1883. The first general congress of the Church of England in Canada was held at Hamilton, Ontario, in the same year, and since that time this church has completed a Dominion organization. A recognition of the increasing importance of the Roman Catholic Church in Canada was given in the appointment, in 1888, of Archbishop Taschereau as the first Canadian cardinal. Though naturally a temperate people, Canadians seem bent on controlling the traffic in intoxicants by coercive measures. The Canada Temperance Act, a local option law passed in 1878, proved abortive through the failure to provide suitable machinery for its enforcement. In 1900, however, it was still in force in twenty-eight electoral districts. Between the years 1892 and 1894 four of the provinces declared for prohibition by majorities aggregating 130,000; but a general plebiscite, held in 1898, resulted in a majority for legislative prohibition of only 13,000. This verdict was looked upon by the Government as inconclusive, and no further action was taken.

Political.—The Governor-Generalship of Canada

became on confederation one of the greatest official appointments in the gift of the Crown. It is agreed that the statesmen who have filled the post have been uniformly successful in holding evenly the balance between political parties, and Canadians are satisfied with the method of appointing the official head of the State. Canada's political history is interesting, as showing the gradual development of a policy strictly Canadian, and yet not divergent from that of the empire. The Liberal-Conservative party which gathered round Sir John A. Macdonald, the first premier, represented a practical school of statesmen. Drawn from the ranks of both parties, they adopted a system of compromise in political matters, and made the early and speedy development of the country the main object of their policy. Opposed to them were the reform party, who took as their watchword financial retrenchment, and therefore opposed the Government in its railway policy and other schemes of rapid development. On the overthrow of the Macdonald ministry in 1873, a reform Government was formed under the Hon. Alex. Mackenzie. Committed by their parliamentary record to a policy of economy, the reformers soon aroused discontent by their neglect of the Canadian Pacific railway project. As consistent believers in free trade, too, they seemed powerless in the face of the financial difficulties that then beset Canada and threatened the ruin of her manufactures. This led to their defeat in 1878. The Conservative party, on returning to power, adopted a highly protective tariff as a defence against American trade encroachment, and this has so far proved itself favourable to the commercial wellbeing of the country that it has been continued to the present day. The reform party, disorganized by defeat, remained in opposition until 1896. During this period it advocated several modifications of the trade policy of

Canada, most of them looking to closer commercial relations with the United States. On the death of Sir John A. Macdonald in 1891, Sir John Abbott became premier, but resigned through ill-health in the following year. He was succeeded by Sir John Thompson, who died at Windsor Castle in 1894, while attending to be sworn in as a member of her Majesty's Privy Council. Sir Mackenzie Bowell then became premier and leader of the Conservative party until 1896, when he was succeeded by Sir Charles Tupper. Sir Wilfrid Laurier's leadership of the reformers, and the appearance of a more conservative tone in the counsels of the party, had restored public confidence; and in the general elections of 1896 the Conservatives, weakened by internal dissensions, met with a signal defeat, which was repeated in 1900. The reform administration has been marked by various measures tending to unite Canada more closely with the empire—such as the adoption of imperial penny postage; the denunciation of the German and Belgian treaties, with the subsequent preferential treatment accorded to British commerce; the carrying-out of plans previously made for cable connexion between Canada and Australia; the contribution of men for the South African war. These measures were stamped anew with popular approval by the elections of 1900, which gave Sir Wilfrid Laurier's Government another lease of power. It is manifest that the broad general result of confederation has been greatly to increase Canada's weight in the councils of the empire, and to draw still more closely the bonds with the motherland. (G. R. P.)

Canal Dover, a village of Tuscarawas county, Ohio, U.S.A., on the Tuscarawas river and the Ohio Canal. Population (1890), 3470; (1900), 5422, of whom 939 were foreign-born and 10 negroes.

CANALS AND INLAND NAVIGATION.

SHIP CANALS IN EUROPE.

THE last quarter of the 19th century saw great improvements in inland navigation, more particularly in Germany, France, and Belgium. International Congresses have been held in the principal cities of Europe to discuss the question of the enlargement of existing canals, and the advantage of affording greater facilities for the water carriage of goods and minerals is now generally recognized. The fact that the cost of maintenance of canals rises but slightly with enlarged trade, while the wear and tear on railways, tramways, and roads increases in direct proportion with any increased weight of traffic, gives ship canals and other navigations a considerable advantage. The great saving effected in the consumption of coal in steamers by the use of triple or quadruple expansion engines enables large cargoes to be carried inland on ship canals at a rate per ton considerably below the cost on railways. The construction in England of the Manchester Ship Canal has been of great benefit to the district it serves not only by reducing the rates of carriage on seaborne traffic, but also by causing the railway rates to be lowered. The same results have occurred on other ship canals that enable large steamers to pass inland to centres of population and manufactories without transshipment of cargo at ports on the coast. Ship canals of early date have had to be enlarged in depth and width to meet the increased size of steamers.

Manchester Ship Canal.—The advantage of a waterway for the conveyance of goods between Lancashire and the sea was so obvious, that so far back as the year 1721 Mr Thomas Steers designed a plan for continuing to Man-

chester the barge navigation which then existed between Liverpool and Warrington. Parliamentary powers were then obtained to improve the rivers Mersey and Irwell from Warrington to Manchester by means of locks and weirs. This work was successfully carried out, and proved of great benefit to the trade of the district. The duke of Bridgewater, who had made a canal from his collieries at Worsley to Manchester, afterwards continued the canal to the Mersey at Runcorn; this extension was opened in 1722 and competed with the Mersey and Irwell Navigation, both routes being navigated by barges carrying about fifty tons of cargo. The Liverpool and Manchester railway at a later date afforded further facilities for conveyance of goods, but the high rates of carriage, added to heavy charges at the Liverpool docks, prejudiced trade, and the question was mooted of a ship canal to bring cotton, timber, grain, or goods direct to Manchester without transshipment. The first plan was made by Mr Wm. Chapman in 1825, and was followed by one designed by Mr Henry Palmer in 1840, but it was not until the year 1882 that the movement was originated that culminated in the opening of the Manchester Ship Canal by Queen Victoria on 21st May 1894.

In determining the plan of the canal the main point which arose was whether it should be made with locks or whether it should be on the sea-level throughout, and therefore tidal. The advantage of a still waterway in navigating large steamers, and the facilities afforded by one constant water-level for works on the banks and the quick discharge of goods at the terminal docks at Manchester, secured the adoption of the plans for a canal with locks as designed by Sir E. Leader Williams. The fresh-

water portion of the canal extended between Manchester and Runcorn, while from the latter place to Garston it was proposed to improve the upper Mersey estuary by constructing training walls and dredging to form a deep central channel. Powers to construct the canal were sought in the Session of 1883, when the Bill passed the Committee of the House of Commons, but was rejected by the Committee of the House of Lords. Brought forward again the next year, it was passed by the Lords but thrown out by the Commons. The opposition from Liverpool and the railway companies was very strong; to meet to some extent that of the former, a continuation of the canal was proposed from Runcorn to Eastham along the Cheshire side of the Mersey, instead of a trained channel in the estuary, and in this form the Bill was again introduced in the Session of 1885, and, notwithstanding strong opposition, was passed by both Houses of Parliament. The cost of this contest to promoters and opponents exceeded £400,000, the various Committees on the Bill having sat over 175 days. Owing to difficulties in raising the capital the works were not commenced until November 1887.

The total length of the canal is $35\frac{1}{2}$ miles, and it may be regarded as divided into three sections. From Eastham to Runcorn it is near or through the Mersey estuary for $12\frac{3}{4}$ miles, and thence to Latchford near Warrington, $8\frac{1}{4}$ miles, it is inland; both these sections have the same water-level, which is raised by high tides. At Latchford the locks stop tidal action, and the canal from that point is fed by the waters of the rivers Mersey and Irwell to Manchester, $14\frac{1}{2}$ miles from Latchford. The canal commences on the Cheshire side of the Mersey at Eastham, about 6 miles above Liverpool. The entrance is well sheltered, and adjoins a good low-water channel communicating with the Sloynne deep at Liverpool. Three entrance locks have been provided close to and parallel with each other, their length and width being 600 by 80, 350 by 50, and 150 by 30 feet. These locks maintain the water-level in the canal nearly to mean high-water level (14 feet 2 inches above the Liverpool datum); when the tide rises above that height the lock gates are opened and the tide flows up to Latchford, giving on high spring tides an additional depth of water of about 7 feet. On the ebb tide this water is returned to the Mersey through large sluices at Randles Creek and at the junction of the river Weaver with the canal, the level of the canal thus being reduced to its normal height. The canal throughout to Manchester has a minimum depth of 26 feet, the lock sills being placed 2 feet lower to allow of the channel being dredged to a depth of 28 feet if necessary hereafter. The minimum width at bottom is 120 feet, allowing large vessels to pass each other at any point on the canal; this width is considerably increased at the locks and other parts. The slopes are generally about $1\frac{1}{2}$ to 1, but are flatter through some portions; in rock-cutting the sides are nearly vertical. From Eastham to Runcorn the canal is alternately inland and on the foreshore of the estuary, on which embankments were constructed to act as dams during the excavation of the canal to keep out the tide, and afterwards to maintain the water-level at low water in the estuary; both sides are faced with heavy coursed stone. The material for the embankments was principally clay excavated from the cuttings. In some places, where the foundation was of a porous nature, sheeting piles of timber had to be used. At Ellesmere Port, where the embankment is 6200 feet long on sand, 13,000 whole timber sheeting piles were driven, to secure the base of the embankment on each side; they were 35 feet long, water jets under pressure through $1\frac{1}{2}$ inch wrought-iron pipes being used at the foot of each pile to assist the sinking of the piles, which were found

most difficult to drive by ordinary means. At the river Weaver ten Stoney roller sluices are built, each 30 feet span, with heavy stone and concrete piers and foundations; at Runcorn, where the river Mersey is narrow, a concrete sea wall 4300 feet long was substituted for the embankment. At various points under the canal cast-iron siphon pipes were laid to carry off any land drainage which was at a lower level than the canal; the largest of these siphons were constructed to allow of the tidal and fresh water of the river Gowy to pass under the canal at Stanlow Point, between Eastham and Ellesmere Port. Two 12-foot siphons are there placed close together; built of cast-iron segments, they are each 400 feet long, and were laid on concrete 4 feet below the bottom of the canal. From Runcorn to Latchford the canal is nearly straight, the depth of cutting varying from 35 to 70 feet, partly in rock, but generally in alluvial deposit. The whole length of the canal passes through the New Red Sandstone formation, with its overlying beds of gravel, clay, sand, and silt, which gave much trouble during the progress of the work; retaining walls of stone and brickwork had to be built in these places to maintain the sides of the canal from slips and injury from the wash of steamers. The canal from Latchford to Manchester is in heavy cutting through the valleys of the rivers Mersey and Irwell. As these rivers are circuitous in course, only very small portions could be utilized in forming the canal; a line as nearly straight as possible was therefore adopted, and involved many crossings of the river channels. During the whole progress of the work these had to be kept open for the discharge of floods and land water, and in some places temporary cuts of considerable length had to be made for the same object. In November 1890 and December 1891 high winter floods covered the whole of the river valleys, filling many miles of the unfinished canal and causing great damage to the slopes. Altogether 23 miles of canal had to be pumped out to enable the work to be completed. After the cuttings between the river channels were finished, the end dams were removed, and the rivers Irwell and Mersey were turned into the new channel now forming the upper portion of the ship canal. The total rise to the level of the docks at Manchester from the ordinary level of the water in the tidal portion of the canal below Latchford locks is 60 feet 6 inches; this is obtained by an average rise of about 15 feet at each of the sets of locks at Latchford, Irlam ($7\frac{1}{2}$ miles nearer Manchester), Barton (2 miles farther), and Mode Wheel ($3\frac{1}{2}$ miles above Barton locks at the entrance to the Manchester docks). For the greater part of this last length the canal is widened at bottom from 120 feet, its normal width, to 170 feet, to enable vessels to lie at timber and other wharves in that part of the canal without interfering with the passing of large vessels to or from the docks. The locks are in duplicate, one being 600 feet long by 65 feet wide, the other 350 feet long by 45 feet wide, with Stoney's sluices adjacent. They are filled or emptied in five minutes by large culverts on each side with side openings into the lock. Concrete with facings of blue Staffordshire bricks is largely used, and the copings, sills, hollow quoins, and fender courses are of Cornish granite. The lock gates are constructed of greenheart timber. The sluices near the locks take the place of the weirs used in the old Mersey and Irwell Navigation; they are 30 feet span each, four being generally used at each set of locks. In ordinary seasons any water not used for lockage purposes passes over the tops of the sluices, which are kept closed; in flood times the sluices are raised to a height which will pass off floods with a comparatively small rise in the canal. There are eight hydraulic installations on the canal, each having duplicate steam-engines and boilers; the mains exceed 7 miles in length,

the pressure being 700 lb to the inch. They work the cranes, lifts, and capstans at the docks, lock gates, and culvert sluices, coal tips, swing bridges, and aqueduct.

At Barton, near Manchester, the Bridgewater Canal crossed the river Irwell on the first navigable aqueduct constructed in England; it was the work of Brindley. Since it was only built at sufficient height to allow of barges passing under it, means had to be found to allow of this important canal being maintained, and yet to permit large steamers to use the ship canal below it. Brindley's canal is on one level throughout its whole length, and as its water supply is only sufficient for the flight of locks by which it descends at Runcorn to the Mersey, locks down to the ship canal would have involved the waste of a lock of water on each side and caused serious delay to the traffic. Sir E. Leader Williams surmounted the difficulty by means of a swing aqueduct for the Bridgewater Canal, which when closed allows of the traffic passing as heretofore, while it is opened to allow of ships crossing it on the lower level of the ship canal. The water in the swing portion of the aqueduct when opened is maintained by closing gates at each end, similar gates being shut at the same time across the fixed portion of the aqueduct. The swing portion is a large steel trough carried by side girders, 234 feet long and 33 feet high in the centre, tapering 4 feet to the ends; the waterway is 19 feet wide and 6 feet deep. The whole works on a central pier with similar arrangements to the largest swing bridges on the canal; it has two spans over the ship canal of 90 feet each. It is somewhat singular that the first fixed canal aqueduct in England should, after the lapse of 136 years, be replaced by the first swing aqueduct ever constructed. The swing aqueduct is moved by hydraulic power, and has never given any trouble in working, even in times of severe frost. The weight of the movable portion, including the water, is 1600 tons.

The manner of dealing with the five lines of railways that were cut through by the canal was one of importance, both in the interests of the travelling public and the trade on the canal; they are all important lines, including the main line of the London and North-Western Railway near Warrington, with its important route to Scotland. Hitherto no such alteration of a railway had been sanctioned by Parliament, and it was only the importance of a ship canal to Manchester that secured the requisite power against the strong opposition of the railway companies. Swing bridges, although in use on some lines to cross navigations, are dangerous and inconvenient, and high-level deviation lines were adopted for each railway crossing the canal. Embankments were made close to and parallel with the old lines, commencing about a mile and a quarter from the canal on each side, the canal itself being crossed by viaducts which give a clear headway of 75 feet at ordinary water-level. Vessels trading on the canal with high masts are provided with telescopic or sliding top masts. The gradients on the railways rising up to the viaducts are 1 in 135. The span of the viaducts is so arranged as to maintain the full width of the canal for navigation; and as the railways generally cross the canal on the skew, this necessitated girders in some cases of 300 feet span. There are nine main roads requiring swing bridges across the canal; all below Barton have a span giving a clear waterway of 120 feet. The width of these bridges varies with the importance of the roads from 20 to 36 feet, and they are constructed of steel, their weight ranging from 500 to 1000 tons each. They work on a live ring of conical cast-iron rollers, and are moved by hydraulic power supplied by steam, gas, or oil engines. The Trafford Road Bridge at the docks at Manchester is the heaviest swing bridge on the canal; being of extra width, it weighs 1800 tons.

The canal being virtually one long dock, wharves at various points have been erected to enable chemical or manufacturing works to be carried on, widenings being provided where necessary. At Ellesmere Port coal tips and sheds have been erected, and the canal is in direct communication with the docks there as well as at Weston Point and Runcorn, where a large trade is carried on with the Staffordshire Potteries and the Cheshire salt districts. At Partington branches from the railways connect the canal with the Yorkshire and Lancashire coal-fields, and the canal is widened out 65 feet on each side for six hydraulic coal tips. At Mode Wheel there are extensive abattoirs and lairages, erected by the Manchester Corporation; also large petroleum oil tanks, graving dock and pontoons, cold-air meat stores, and other accommodation for traffic. At Manchester the area of the docks is 104 acres, with 152 acres of quay space, having over 5 miles of frontage to the docks, which are provided with a number of three-storey transit sheds, thirteen seven-storey and seven four-storey warehouses, and a large grain silo. The London and North-Western and Lancashire and Yorkshire Railway Companies have made branch lines to the docks, the railways and sidings at which are over 30 miles in length. Much traffic is also carted, or dealt with by inland canals in direct communication with the docks. The substitution of a wide and deep canal, nearly straight, for comparatively shallow and narrow winding rivers, and the use of large sluices in place of fixed weirs to carry off the river water, have been of great advantage to the district in greatly reducing the height of floods.

The total amount of excavation in the canal, docks, and subsidiary work amounted to over 54 million cubic yards, nearly one-fourth of which was sandstone rock; the excavated material was used in forming the railway deviation embankments, filling up the old beds of the rivers, and raising low lands near the canal. As many men were employed on the works as could be obtained, but the number never exceeded 17,000, and the greater part of the excavation was done by about eighty steam navvies and land dredgers. For the conveyance of excavation and materials, 228 miles of temporary railway lines were laid, and 173 locomotives, 6300 waggons and trucks, and 316 fixed and portable steam-engines and cranes were employed, the total cost of the plant being nearly £1,000,000. The expenditure on the works, including plant and equipment, to 1st January 1900, was £10,327,666. The purchase of the Mersey and Irwell and Bridgewater Navigations (£1,786,651), land and compensation (£1,223,809), interest on capital during construction (£1,170,733), and parliamentary, superintendence, and general expenses brought up the total amount to £15,248,437.

The traffic on the canal has gradually increased from 925,659 tons in the year 1894 to 2,778,108 tons in 1899. After its opening considerable reductions were made in the railway rates of carriage and in charges at the Liverpool docks in order to meet the lower cost of conveyance by shipping passing up it. The result has been of great advantage to the trade of Lancashire and the surrounding districts, and the saving in the cost of carriage, estimated at £700,000 a year, assists manufacturers to meet the competition of their foreign opponents who have the advantage of low rates of carriage on the improved waterways of America, Germany, France, and Belgium. Before the construction of the canal, large works had left Manchester to establish themselves at ports like Glasgow, where they could save the cost of inland carriage. Since its opening, new industries have been started at Manchester and along its banks, warehouses and mills that were formerly empty are now occupied, while nearly 10,000 new

houses have been built for the accommodation of the work-people required to meet the enlarged trade of the city.

The Gloucester and Berkeley Canal.—The first Act authorizing the construction of this canal was passed in the year 1793; five subsequent Acts for making alterations in its route and raising funds were obtained, but the works were not completed until 1827. Mr Robert Mylne was the first engineer employed, but afterwards Mr Telford was called in to revise the plans, and they were carried out under his direction. It was originally proposed to make the entrance at Berkeley Pill, but it was afterwards constructed at a more sheltered position at Sharpness Point. The water supply is derived from the river Frome, which in its course to the Severn crosses the canal at a point where it is joined by the Stroudwater Navigation; this connects it with the Thames and Severn Canal and the inland navigations. The navigation of the Severn from Sharpness to Gloucester is circuitous and dangerous, and while the distance is 28 miles, the length of the canal between the same points is $16\frac{1}{2}$ miles. It is on one level throughout, having basins at both ends for shipping, and locks to the Severn. The depth is 18 feet, and vessels which draw more water lighten their cargoes at Sharpness. Sailing ships were formerly towed up the canal by horses, but since 1869 steam tugs have been used. The cargoes are generally timber or grain.

Exeter Canal.—This canal is an interesting work, being the first canal carried out in the United Kingdom for the purpose of enabling seagoing vessels to pass to an inland port. The river Exe was very early utilized by small craft trading to Exeter, Parliament having granted powers for the improvement of the navigation by the construction of a canal 3 miles long from Exeter to the river; at a later date this canal was extended lower down to the tidal estuary of the Exe. Previous to the year 1820 it was only available for vessels of a draft not exceeding 9 feet, but by deepening it, raising the banks, and constructing new locks, vessels drawing 14 feet of water were enabled to pass up to a basin and wharves at Exeter. These works were carried out by Mr James Green under the advice of Mr Telford. The canal is still useful for the coasting trade in coal and timber, but the great increase in the size of steamers and sailing vessels has diminished its importance, more particularly as it does not terminate in a manufacturing or mineral district.

Newry Canal.—This, the only ship canal in Ireland, was constructed between the years 1761 and 1769. Like the Gloucester and some other canals, it was made to avoid the upper and shallow part of a river navigation, the river Newry being only navigable to that town on high tides for small vessels. At first the canal was only 2 miles long, from Fathom to Newry, but in 1829 it passed from the hands of the Irish Board of Navigation to a private company, who obtained powers to lengthen it $1\frac{1}{2}$ miles seawards to deeper water, and also to improve the navigation of the river thence to Carlingford Lough, according to plans prepared by Sir John Rennie. The river was improved by blasting and dredging, and the old canal enlarged to the same width and depth as the new portion, enabling vessels of $13\frac{1}{2}$ feet draught to pass from the sea to Newry.

Suez Canal (see *Ency. Brit.* vol. iv. pp. 789–792, and vol. xxii. pp. 620–621).—The rapid increase of traffic and the greater size of the vessels using the canal caused so much delay in the passage, that a consultative commission was formed in 1884 to consider the question of either enlarging the existing canal or constructing another one alongside it. After full investigation they unanimously decided in favour of increasing the depth of the canal from 26 feet to 27 feet 10 inches, and the width from 72 feet to 121 feet 4 inches.

This work, which was delayed through financial considerations and the traffic on the canal, was not completed till December 1898. The dredging on the canal is being continued, and it is expected that a depth of 31 feet will be obtained by 1902. The ultimate width (at a depth of 26 feet 3 inches) is intended to be 213 feet in straight reaches, and 246 to 260 feet on curves, between Port Said and the Bitter Lakes; thence to Suez 246 feet, increasing to 262 feet on curves. The limit of draught of vessels has been increased from 24 feet 6 inches to 25 feet 7 inches, nine additional sidings or passing-places have been provided, and the general use of the electric light has enabled steamers to continue their voyage day and night, thus considerably shortening the time occupied in passing through the canal.

Corinth Canal.—This ship canal crosses the Isthmus of Corinth, the land along its route being low at each end, but high in the central portion. It is the revival of a scheme dating back so far as 600 B.C., when Periander employed Egyptian engineers to survey the isthmus; in A.D. 66 Nero commenced the works along the site of the present canal, but at his death they were abandoned. After the failure to construct the canal, a slipway was made, over which small vessels were transferred on wooden rollers. The works of the canal were commenced in 1882, but were not completed until 1893 through lack of funds. It is nearly 4 miles long, and it shortens the sea route from the Gulf of Patras to the Gulf of Athens by 180 miles. It passes through the isthmus in a straight line, with the advantage of not crossing any river; only one bridge, serving both for railway and road traffic, was required over the canal to join the island cut off from the mainland. The bottom width of the canal is 72 feet, the depth of water 26 feet. The work was commenced by dredging entrance canals at each end and constructing breakwaters. Trial shafts were sunk along the line of the canal to determine the nature of the strata through which the cutting had to be made, but as has often been the case with other works of a similar character, the material proved to be of a more difficult nature than had been anticipated, and the numerous faults and irregularities in the strata largely increased the cost beyond the estimate. At one point the cutting is 287 feet deep, and for a length of 2 miles it averages 200 feet. The total amount of excavation was nearly 15,000,000 cubic yards. Much of this was rock, but as it was too soft to resist erosion by the wash of steamers, long lengths of the canal had to be protected by masonry or rubble stone, 436,000 cubic yards being quarried for this purpose. Notwithstanding these costly precautions, the sides of the canal have given much trouble since its opening, and slips have occurred causing blocks to traffic. Owing to deficient width and strong currents, the traffic is principally confined to small vessels and passenger steamers. The total cost amounted to nearly £3,000,000.

Cronstadt Canal.—This canal was made with the object of bringing St Petersburg into direct connexion with the Baltic for large vessels; these had previously been prevented from reaching that city by the bar of the Neva, and the transshipment of their cargoes into barges at Cronstadt caused considerable expense and delay. Peter the Great originally designed and began the canal, but the works were not proceeded with after his death. In 1877 operations were again commenced, and they were completed in 1885. Starting from the Neva at St Petersburg, the canal diverges from the estuary channel and proceeds in a south-westerly direction for about 2 miles; then curving round towards the north-west, it runs in a straight line to Cronstadt, the total distance being $17\frac{1}{2}$ miles. For the first $7\frac{1}{2}$ miles it is protected by embankments formed with part of the excavated material, and it

has a bottom width of 207 feet; for the remaining 10 miles it has a bottom width of 275 feet, and is merely a dredged channel through the gulf, without embankments. The depth is 22 feet deep throughout. Three basins, formed by widening out the canal near St Petersburg, give an area of 230 acres for the accommodation of shipping. The total cost of the work, about £1,300,000, was paid by the State, and there are no tolls.

Baltic and Black Sea Canal.—A canal has been projected from the Baltic to the Black Sea utilizing the rivers *en route*. It is proposed to have a bottom width of 115 feet, and a depth throughout of 28 feet, but its great length, nearly 1000 miles, brings up the estimated cost to £100,000,000. The advantage of a deep canal between the Baltic and the Black Sea, entirely through Russian territory, which would enable men-of-war and other steamers to pass inland, is obvious; but it is probable that it would be closed by ice in the winter season, and its heavy cost also makes it very doubtful whether the Russian Government will ever undertake the work.

The North Sea and Baltic Canal.—This canal (officially called the Kaiser-Wilhelm Canal) was constructed by the German Government between the years 1887 and 1895, at a cost of about £8,000,000 (of which £2,550,000 was paid by Russia, and the rest by the Imperial Exchequer). It affords a better and shorter route than the sea passage; but it was mainly designed for strategic reasons, its width and depth allowing large ironclads to pass through the German territory of Holstein from the Baltic to the North Sea, without the dangers and delay of the long voyage round Jutland. The average time for passing through the canal is eight to ten hours. It begins in the river Elbe, near Brunsbüttel, and thence traversing the Kuden Lake, passes south of Rendsburg and the Lower Eider to Holtensau, in the harbour of Kiel Bay. It is 61½ miles long, with a depth of 29½ feet, and a surface breadth of 219 feet; but as its bottom width is only 72 feet, large vessels can only pass each other at six places, about 2½ miles apart, where it is specially widened out for the purpose. Locks (492 feet long between the gates, 82 feet

B.V.D. & O.F.R.H. E.M.P. 25 Oxford, 1908
SKETCH MAP OF THE NORTH SEA AND BALTTIC CANAL.

broad, and 32 feet deep) have been constructed at each end to regulate the height of the water, which is level throughout the whole length. The canal is crossed by two fixed bridges 138 feet above water-level, one at Grünthal, with a span of 513 feet, carrying the Neumünster-Heide Railway line. The other at Lewensau, near Kiel, 535 feet in span, carrying the Kiel-Flensburg Railway line. There are also three double swing bridges, worked by hydraulic power, at Brunsbüttel, Rendsburg, and between Rendsburg and Kiel. The total amount of excavation was 106,000,000 cubic yards. The work was very difficult through the low lands of the Kuden Lake, where wide sand dams had to be formed on each side of the canal on soft peaty soil; after the dams had sunk through the peat, the canal was dredged between them, the banks being now formed by the sand dams. The advantage to Germany of a secure inland waterway for the navy is important, but the use by the mercantile marine is only slowly developing, in consequence of the saving in time

being to some extent neutralized by the tolls charged on the canal.

The extent to which the canal has been used, together with particulars of revenue and expenditure, is shown in the subjoined table:—

Year.	Number of Vessels passing through.	Tonnage.	Receipts.	Expenditure.	Percentage tonnage, German.
1896	20,068	1,751,065	£48,088	£111,300	67·8
1897	21,904	2,345,849	59,986	103,740	...
1898	25,224	3,009,011	76,780	113,900	69·3
1899	26,524	3,451,273	89,370	...	65
1900	29,571	4,282,258	106,658	...	62·3

Brussels Canal.—Brussels has long been connected with Antwerp and the Scheldt by a canal 17½ miles in length with three locks; this begins in a basin at Brussels, and terminates opposite Boom, near Willebroeck, in the river Rupel, by which vessels pass to the Scheldt. As the depth of the canal is only 10½ feet, its use is confined to vessels not exceeding 400 tons. It is now proposed to increase the depth to 20 feet, and to enlarge the locks in order to allow steamers of 2000 tons to reach Brussels. The necessary funds, estimated at about £1,500,000, are to be provided by the State, the city, and the neighbouring communes.

Ghent Canal.—Like other towns in Belgium and Holland, Ghent at an early date began to develop a waterway to the sea, and a canal was opened in 1561 to a tributary of the Scheldt at Sas-de-Gand. In 1758 the opening of the canal from Ghent to Bruges gave it another but longer route. It was found that the navigation to the Scheldt was silting up, and a canal was made from Sas-de-Gand to Terneuzen on the Scheldt, which gave a continuous and direct route to the sea, passing partly through Holland and partly through Belgium. By a convention between those countries a considerable enlargement of the canal was carried out, and the work was completed in 1883. The canal is 20 feet deep, with a bottom width of about 56 feet. There are locks at Sas-de-Gand and Terneuzen 295 feet long and 39½ feet wide. The docks at Ghent have been enlarged, and the result of improving the canal has been a considerable increase in the traffic, and in the trade of Ghent.

Bruges Canal.—During the Middle Ages Bruges was a port of importance, having communication with the sea by means of a canal to the Zwyn estuary, which, however, ultimately filled up with sand to such an extent as to prevent navigation. A canal was afterwards made to Ostend, but owing to the increasing size of seagoing vessels, a project was sanctioned for a larger and more direct canal to Zeebrugge, on the seacoast. The work was commenced in 1896, and as it is only 6½ miles long, through flat land, it is free from the difficulties that other ship canals have met with; it is 26½ feet deep, having a bottom width of 72 feet, with flat slopes pitched with stone near the water-level. The canal is expected to be completed in 1902; it is being excavated by dredgers which deposit the soil direct on to the adjacent land by means of shoots, thus forming embankments on each side of the canal. As the coast is not favourable for a deep harbour, an embankment, continued by an open jetty and terminating in a solid breakwater nearly 5000 feet long, is being made to protect the entrance to the canal. The embankment extends to low water west of the canal; the open jetty is designed to permit the flow of the tide across the entrance to scour away deposits of sand or silt. The breakwater curves eastwards for the greater part of its length, when it becomes almost parallel with the shore, extending past the canal entrance. As the harbour will be used as a port of call, the breakwater is provided with a quay wall, railway

lines, and sheds. The outer part of the breakwater is formed of large concrete blocks weighing 2500 to 3000 tons each, in order better to resist the heavy seas on this exposed coast; the upper courses are blocks of 50 tons each. By an ingenious arrangement the largest blocks, which are 24½ feet thick and 26 feet in height, are made hollow in iron caissons; when set hard, they are floated out and sunk in their position in the breakwater, the central portion of the block being then filled by concrete lowered down by means of cranes and skips. The harbour formed by the breakwater will be about 270 acres in area. From it an entrance channel extends to the sea lock, which is 840 feet long between the caissons that here take the place of ordinary gates; the lock is 79 feet wide at the bottom, and several vessels of moderate size can be locked through at the same time. The caissons, which run on wheels into recesses in the lock walls, weigh 479 tons each, and they have the advantage of being able to maintain the level of the water in the canal either above or below the tide outside; to effect this with ordinary lock gates, double pairs of gates would have been required. The docks which are being constructed at Bruges are provided with railway lines, sheds, and cranes, and have communications with the Ostend and other canals. The commercial success of the canal has yet to be proved. It will have to contend with neighbouring ports, but it is expected that this enterprise, which is being carried out at the joint cost of the State and local bodies, will restore the past prosperity of Bruges.

Proposed Paumotu Canal.—This scheme, referred to in the 9th edition of this work, has not been proceeded with.

(E. L. W.)

SHIP CANALS IN AMERICA.

Isthmian Canal Schemes.—When he crossed the Atlantic, the object Columbus had in view was to find a western passage from Europe to Cathay. It was with the greatest reluctance, and only after a generation of unremitting toil that the explorers who succeeded him became convinced that the American continent was continuous, and formed a barrier of enormous extent to the passage of vessels. The question of cutting a canal through this barrier at some suitable point was immediately raised. In 1550 the Portuguese navigator Antonio Galvao published a book to demonstrate that a canal could be cut at Tehuantepec, Nicaragua, Panama, or Darien, and in 1551 the Spanish historian Gomara submitted a memorial to Philip II. urging in forcible language that the work be undertaken without delay. But the project was opposed by the Spanish Government, who had now concluded that a monopoly of communication with their possessions in the new world was of more importance than a passage by sea to Cathay. It even discouraged the improvement of the communications by land. To seek or make known any better route than the one from Porto Bello to Panama was forbidden under penalty of death. Geographical research was stifled. For more than two centuries no serious steps were taken towards the construction of the canal, if exception be made of the disastrous attempt at colonization at Caledonia Bay by the Scots under Paterson in 1698. In 1771 the Spanish Government, having changed its policy, ordered a survey for a canal at Tehuantepec, and finding that line impracticable, ordered surveys in 1779 at Nicaragua, but political disturbances in Europe soon prevented further action. In 1808 the isthmus was examined by Alexander von Humboldt, who pointed out the lines which he considered worthy of study. After the Central American Republics acquired their independence in 1823, there was a decided increase of interest in the canal question. In 1825 the Republic of the Centre, in consequence of receiving applications for concessions from

citizens of Great Britain, and also from citizens of the United States, made overtures to the United States for aid in constructing a canal, but they resulted in nothing. In 1830 a concession was granted to a Dutch corporation under the special patronage of the King of the Netherlands to construct a canal through Nicaragua, but the revolution and the separation of Belgium from Holland soon followed, and the scheme fell through. Since that date numerous concessions have been granted to citizens of the United States, France, and Belgium, both for the Nicaragua and the Panama lines, but with the exception of the concession of 1878 for Panama and that of 1887 for Nicaragua, no work of construction has been done under any of them.

Knowledge of the topography of the isthmus was extremely vague until the great increase of travel due to the discovery of gold in California in 1849 rendered improved communications a necessity. A railroad at Panama and a canal at Nicaragua were both projected. Instrumental surveys for the former in 1849, and for the latter in 1850, were made by American engineers, and, with some small exceptions, were the first really accurate surveys made up to that time, though numerous exploring expeditions had been undertaken, some under Government auspices and others under private enterprise, some furnishing valuable information and others simply adding to the confusion already existing. But they resulted in geographical knowledge sufficient to eliminate from consideration all but the following routes:—1. Nicaragua; 2. Panama; 3. San Blas; 4. Caledonia Bay; 5. Darien; 6. Atrato River, of which last there were four variants, the Tuyra, the Truando, the Napipi, and the Bojaya. In 1866, in response to an inquiry from Congress, Admiral Charles H. Davis, U.S. Navy, reported that "there does not exist in the libraries of the world the means of determining even approximately the most practicable route for a ship canal across the American isthmus." To clear up the subject the United States Government sent out, between 1870 and 1875, a series of expeditions under officers of the Navy, by whom all of the above routes were examined. The result was to show that the only lines by which a tunnel could be avoided were the Panama and the Nicaragua lines; and in 1876 a United States Commission reported, after careful consideration of all the data collected, that the Nicaragua route possessed greater advantages and offered fewer difficulties than any other. Whether they would have so reported if they had possessed all the information now available may be doubted, but from that day the Nicaragua line has been the favourite in American public opinion. At Panama the isthmus is narrower than at any other point except San Blas, its width in a straight line being only 35 miles, and the height of the continental divide is only 300 feet, which is higher than the Nicaragua summit, but less than half the height on any other route. At Nicaragua the distance is greater, being about 156 miles in a straight line, but more than one-third is covered by Lake Nicaragua, a sheet of fresh water with an area of about 3000 square miles and a maximum depth of over 200 feet, the surface being about 105 feet above sea-level. Lake Nicaragua is connected with the Atlantic by a navigable river, the San Juan, and is separated from the Pacific by the continental divide, which is about 160 feet above sea-level. For a considerable portion of its length the San Juan forms the boundary between Nicaragua and Costa Rica. At Nicaragua only a canal with locks can be considered. At Panama a sea-level canal is a physical if not a financial possibility.

By the Clayton-Bulwer Treaty of 1850 with Great Britain, by the Treaty of 1846 with New Granada (Colombia), Article XXXV., and by the Treaty of 1867 with

Nicaragua, Article XV., the United States has guaranteed that the canal shall be neutral, and, furthermore, that it shall be used and enjoyed upon equal terms by the citizens of both countries in each case. Nicaragua guaranteed by her Treaty of 1859 with France that the citizens of both countries should use the canal upon equal terms, and France guaranteed its neutrality. Nicaragua guaranteed by her Treaty of 1858 with Belgium and of 1850 with Spain, that the citizens of those countries should enjoy the same advantages as are granted to the most favoured nations. Costa Rica granted by her Treaty of 1850 with Spain free transit upon the same terms as for her own citizens. All of these treaties are still in force. Colombia has not made special treaties with nations other than the United States, but in addition to the Treaty of 1846 just mentioned, she is committed in the law of concession to the principle that the canal shall be neutral. A modification of the Clayton-Bulwer Treaty being necessary to enable the United States to build the canal, a Treaty making such modifications, but preserving the principle of neutrality, known as the Hay-Pauncefote Treaty, was negotiated with Great Britain in 1900; it was amended by the United States Senate, and the amendments not proving acceptable to Great Britain, the Treaty lapsed in March 1901; but a new Treaty was negotiated in the autumn, and accepted in December by the U.S. Senate.

Many elaborate investigations of the probable traffic and resulting revenue of a canal have been made. The most recent and most trustworthy are those of the new Panama Canal Company and those of the Isthmian Canal Commission. The Commission's estimates are slightly in excess of those of the Company, but being of later date, rather confirm than controvert the accuracy of both. The Commission found that the amount of shipping which would have used the canal if open in the year 1898-99 was 5,736,456 tons net register, and that the probable amount for 1909 would be about 7,000,000 tons.

The completion of the Suez Canal in 1869, and its subsequent success as a commercial enterprise, drew attention more forcibly than ever to the American isthmus. The citizens of France, who had gained money and fame in that enterprise, were especially eager to embark in a new one of similar character. In the year 1876 an association entitled "Société Civile Internationale du Canal Inter-oceanique" was organized in Paris to make surveys and explorations for a ship canal. An expedition under the direction of Lieutenant L. N. B. Wyse, an officer of the French Navy, was sent to the isthmus to examine the Panama line. In May 1878 Lieutenant Wyse, in the name of the association, obtained a concession from the Colombian Government, commonly known as the Wyse Concession. This is the concession under which work upon the Panama Canal has been prosecuted. Its first holders did no work of construction.

In May 1879 an International Congress composed of 135 delegates from various nations—some from Great Britain, United States, and Germany, but the majority from France—was convened in Paris under the auspices of Ferdinand de Lesseps, to consider the best situation for, and the plan of, a canal. After a session of two weeks the Congress decided that the canal should be at the sea-level, and at Panama. Immediately after the adjournment of the Congress the Panama Canal Company was organized under a general law of France, with Lesseps as president, and it purchased the Wyse concession from the company which held it at the price of ten million francs. An attempt to float this company in August 1879 failed, but a second attempt, made in December 1880, was fully successful, 600,000 shares of 500 francs each being sold. The next two years

were devoted to surveys and examinations and preliminary work upon the canal. The plan adopted was for a sea-level canal having a depth of 29½ feet and bottom width of 72 feet, involving excavation estimated at 157,000,000 cubic yards. The cost was estimated by Lesseps in 1880 at 658,000,000 francs, and the time required at eight years. The terminus on the Atlantic side was fixed by the anchorage at Colon, and that on the Pacific side by the anchorage at Panama. Leaving Colon (see Map) the canal passes through low ground by a direct line for a distance of 6 miles to Gatun, where it intersects the valley of the Chagres river; passes up that valley for a distance of 21 miles to Obispo, where it leaves the Chagres and ascends the valley of a tributary, the Cumacho; cuts through the watershed at Culebra, and thence descends by the valley of the Rio Grande to Panama Bay. Its total length from deep water in the Atlantic to deep water in the Pacific is about 47 miles. It is laid out in such a way as to give easy curvature everywhere; the sharpest curve, of which there is but one, has a radius of 6200 feet, four others have a radius of 8200 feet, and all others have a radius of 9800 feet or more. To secure this it was necessary to select a point for crossing the watershed where the height was somewhat greater than that of the lowest pass. The maximum height on Culebra Cut is about 328 feet above sea-level. The harbours at Colon and Panama are not first-class, but are sufficiently good for the terminus of a canal where the stay of vessels is short. The line is essentially the same as that followed by the Panama railroad, the concession for which granted a monopoly of that route; the Wyse Concession, therefore, was applicable only upon condition that the canal company could come to an amicable agreement with the railroad company.

The principal difficulties to be encountered in carrying out this plan consist in the enormous dimensions of the cut to be made at Culebra, and in the control of the Chagres river, the valley of which is occupied by the canal for so large a part of its length. This stream is of torrential character, its discharge varying from a minimum of about 350 cubic feet to a maximum of over 100,000 cubic feet per second. It rose at Gamboa 1st December 1890, 18½ feet in twelve hours, its volume increasing from 15,600 cubic feet to 57,800 cubic feet per second at the same time; and similar violent changes are not uncommon. To admit a stream of this character to the canal would be an intolerable nuisance to navigation unless space could be provided for its waters to spread out. For a canal with locks the remedy is simple, but for a sea-level canal the problem is much more difficult, and no satisfactory solution of the question was ever reached under the Lesseps plan.

Work under this plan continued until the latter part of 1887, the management being characterized by a degree of extravagance and corruption that have had few if any equals in the history of the world. By that time it had become evident that the canal could not be completed at the sea-level with the resources of time and money then available. The plan was accordingly changed to one including locks, and work was pushed on with vigour until 1889, when the company, becoming bankrupt, was dissolved by a judgment of the Tribunal Civil de la Seine, dated 4th February 1889, a liquidator being appointed by the court to take charge of its affairs. One of the more important duties assigned to this official was to keep the property together and the concession alive, with a view to the formation of a new company for the completion of the canal. He gradually reduced the number of men employed, and finally suspended the works on 15th May 1889. He then proceeded to satisfy himself that the canal project was feasible, a question about which the failure of the

**First
Panama
Company.**

company had caused grave doubts, and to this end caused an inquiry to be held by a commission of French and foreign engineers, having at their head M. Guillemain, the Director of the National School of Ponts et Chaussées. This commission reported on 9th May 1890 that a canal with locks, for which they submitted a plan, could be built in eight years at a cost of 580,000,000 francs for the works, which sum should be increased to 900,000,000 francs to include administration and financing. They reported that the plant in hand was in good condition and would probably suffice for finishing the canal, and they estimated the value of the work done and of the plant in hand at 450,000,000 francs.

The time within which the canal was to be completed under the Wyse Concession having nearly expired, the liquidator sought and obtained from the Colombian Government an extension of ten years. The law which granted this extension is dated 26th December 1890, and it provided that a new company should be formed and work upon the canal resumed on or before 28th February 1893. This condition not having been fulfilled, a second extension was sought and obtained 4th April 1893; it provided that the term of ten years granted by the extension of 1890 should begin to run not later than 31st October 1894. By an agreement dated 26th April 1900, the time was still further extended to 31st October 1910. For each of these extensions the Colombian Government exacted heavy subsidies. After many difficulties and delays the liquidator finally secured the organization of a new company on the 20th October 1894. The old company and the liquidator had raised, by the sale of stock and bonds, the sum of 1,271,682,637 francs. The securities issued to raise this money had a par value of 2,245,151,200 francs, and they are held by about 200,000 persons. In all about 72,000,000 cubic yards had been excavated, and an enormous quantity of machinery and other plant had been purchased and transported to the isthmus at an estimated cost of 150,000,000 francs. Nearly all of the stock of the Panama Railroad—68,534 of the 70,000 shares existing—also had been purchased, at a cost of 93,268,186 francs.

The new company has been regularly organized under French law, and has been recognized by the Colombian Government. It is technically a private corporation, but the great number of persons interested in the securities of the old company, and the special legislation of the French Chambers, give it a semi-national character. By the law of 8th June 1888, all machinery and tools used in the work must be of French manufacture, and raw material must be of French origin. Its capital stock consists of 650,000 shares of 100 francs each, of which 50,000 shares belong to Colombia. It succeeded to all the rights of the old company in the concessions, works, lands, buildings, plant, maps, drawings, &c., and shares of the Panama Railroad upon the following conditions, viz.:—It undertook to finish the canal if, after further careful study, that were found expedient; after completion the revenues were to be applied, first to the payment of all subsidies due to the Colombian Government, all expenses of operation and maintenance, all interest and sinking fund on loans, and all sums required by law for a reserve fund; then five per cent. on the capital stock was to be set aside for the payment of dividends, and to provide a sinking fund for redeeming the stock, all of which must be redeemed within ninety-nine years; and the balance remaining, if any, was to be divided into two parts, one of forty per cent. to go to the stockholders, and the remaining sixty per cent. to the liquidator. For the contingency that the canal should not be completed, special conditions were made as to the

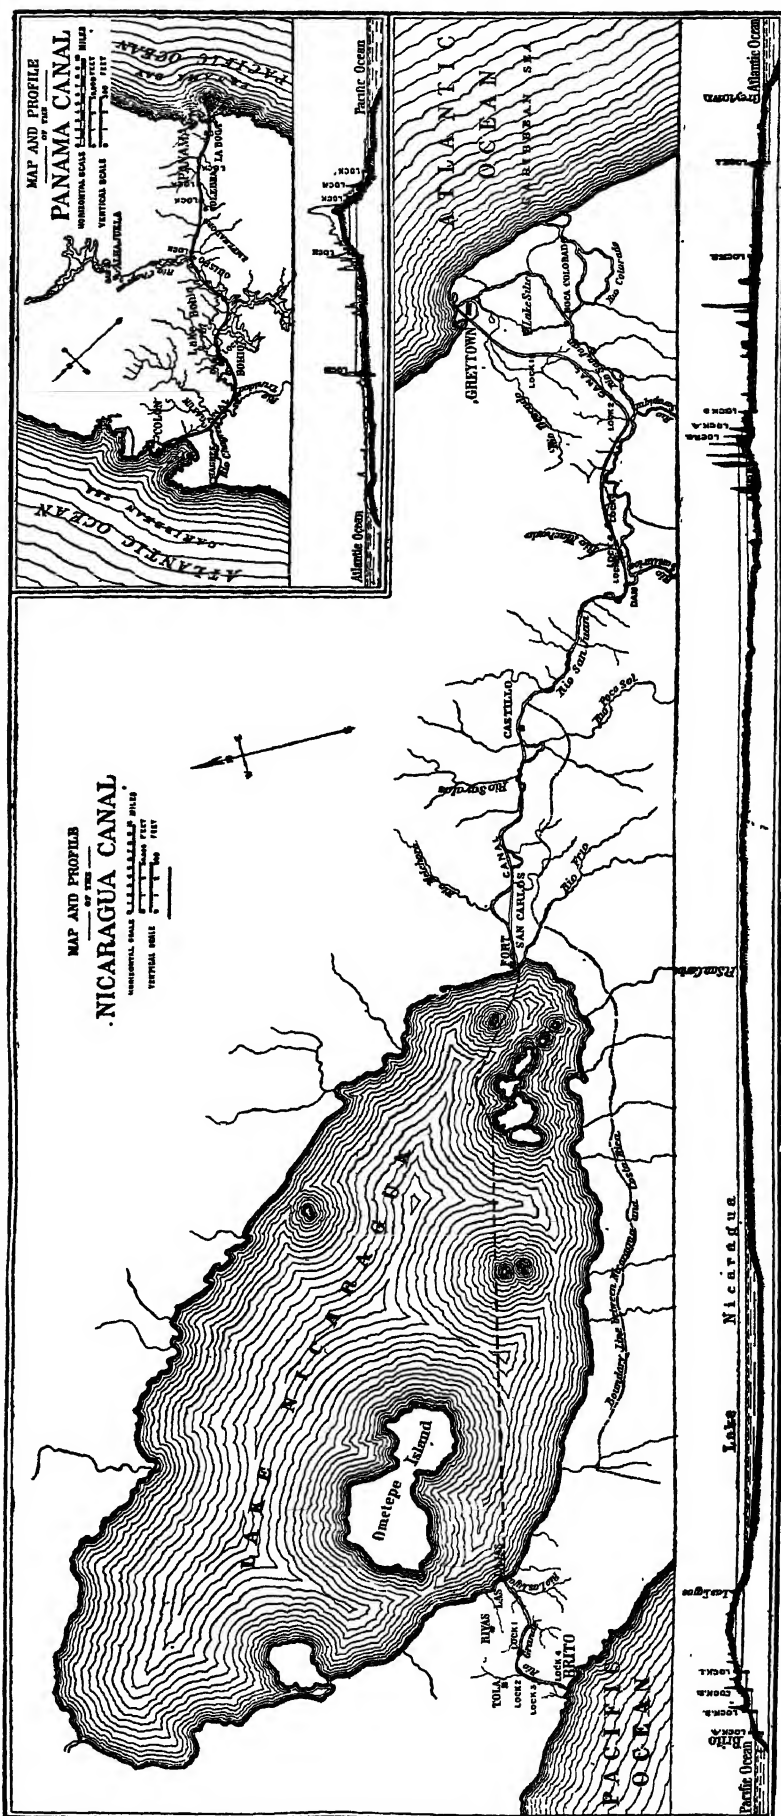

Panama Railroad shares. These are to revert to the liquidator, but the company has the privilege of purchasing them for 20,000,000 francs in cash and half the net annual profits of the road. The Panama Railroad retains its separate organization as an American corporation. Its relations to the Colombian Government have remained unchanged throughout the vicissitudes of the canal company, its present principal stockholder. The security-holders of the old canal company thus have a contingent interest in the new company. They have no direct voice in its management, but to protect their interests the liquidator has the right to appoint an Auditing Commission of three persons to inspect the works and accounts, the expense to be borne by the company. The old security-holders have the preference in subscriptions for one-half the present stock of the company and for the whole of all future issues.

Immediately after its organization in 1894 the new company took possession of the property (except the Panama Railroad shares, which are held in trust for its benefit), and proceeded to make a new study of the entire subject of the canal in its engineering and commercial aspects. It resumed the work of excavation, with a moderate number of men sufficient to comply with the terms of the concession, in a part of the line—the Emperador and Culebra cuts—where such excavation must contribute to the enterprise if completed under any plan. By the middle of 1895 about 2000 men had been collected, and since that time the work has progressed continuously, the number of workmen varying between 1900 and 3600. The amount of material excavated to the end of 1899 was about five million cubic yards. The amount expended to 30th June 1899 was about 35,000,000 francs, besides about 6,500,000 francs advanced to the Panama Railroad Company for building a pier at La Boca.

The charter provided for the appointment by the company and the liquidator of a special engineering commission of five members, to report upon the work done and the conclusions to be drawn therefrom, this report to be rendered when the amounts expended by the new company should have reached about one-half its capital. The report was to be made public, and a special meeting of the stockholders was then to be held to determine whether or not the canal should be completed, and to provide ways and means. The time for this report and special meeting arrived in 1898. In the meanwhile the company had called to its aid a Technical Committee composed of fourteen engineers, European and American, some of them among the most eminent in their profession. After a study of all the data available, and of such additional surveys and examinations as it considered should be made, this committee rendered an elaborate report dated 16th November 1898. This report was referred to the above-mentioned statutory commission of five, who reported in 1899 that the canal could be built according to that project within the limits of time and money estimated. The special meeting of stockholders was called immediately after the regular annual meeting of 30th December 1899. It is understood that the liquidator (who holds about one-fourth the stock) refused to take part in it, and that no conclusions were reached as to the expediency of completing the canal or as to providing ways and means. The engineering questions had been solved to the satisfaction of the company, but the financial questions had been made extremely difficult, if not insoluble, by the appearance of the United States Government in the field as a probable builder of an isthmian canal. The company continued to conduct its operations in a provisional way, without appealing to the public for capital.

The plan adopted by the company involves two levels above the sea-level (see Map)—one of them an artificial lake to be created by a dam at Bohio, to be reached from the Atlantic by a flight of two locks, and the other, the summit-level, to be reached by another flight of two locks from the preceding. The summit-level is to have its surface at high water 102 feet above the sea, and to be supplied with water by a feeder leading from an artificial reservoir to be constructed at Alajuela in the upper Chagres valley; the ascent on the Pacific side to be likewise by four locks. The canal was to have a depth of $29\frac{1}{2}$ feet and a bottom width of about 98 feet, with an increased width in certain specified parts. Its general plan was the same as that adopted by the old company. The locks were to be double, or twin locks, the chambers to have a serviceable length in the clear of 738 feet, with a width of 82 feet and a depth of 32 feet 10 inches, with lifts varying from 20 to 33 feet, according to situation and stage of water. The time required to build the canal was estimated at ten years, and its cost at 525,000,000 francs for the works, not including administration and financing. The old Panama Canal Company began its work without adequate knowledge of the physical conditions of the isthmus. It inaugurated at an early day some of the surveys and examinations required to supply the deficiency, and some of these it maintained as long as it continued to exist. Additional surveys were made by the liquidator, and very extended surveys and observations have been made by the new company. The information concerning all that relates to the topography, hydrography, and geology of the isthmus, as well as the cost of work, is now much more complete than is usual before the inauguration of an engineering enterprise in a new country, and estimates of cost are proportionately more trustworthy.

The occupation of the Panama route by Europeans, and the prospect of a canal there under foreign control, was not a pleasing spectacle to the people of the United States. The favour with which the Nicaragua route had been considered since 1876 began to assume a partisan character, and the movement to construct a canal on that line to assume a practical shape. In 1884 a Treaty, known as the Frelinghuysen-Zarala Treaty, was negotiated with Nicaragua, by the terms of which the United States Government was to build the canal without cost to Nicaragua, and after completion it was to be owned and managed jointly by the two Governments. The Treaty was submitted to the United States Senate, and in the vote for ratification, 29th January 1885, received thirty-two votes in its favour against twenty-three. The necessary two-thirds vote not having been obtained, the Treaty was not ratified, and a change of administration occurring soon afterwards, it was withdrawn from further consideration. This failure led to the formation in New York by private citizens in 1886 of the Nicaragua Canal Association, for the purpose of obtaining the necessary concessions, making surveys, laying out the route, and organizing such corporations as should be required to construct the canal. They obtained a concession from Nicaragua in April

MAPS OF THE NICARAGUA AND PANAMA CANALS.

1887, and one from Costa Rica in August 1888, and sent parties to survey the canal. An Act for the incorporation of an association to be known as the Maritime Canal Company of Nicaragua passed Congress and was approved 20th February 1889, and on 4th May 1889 the company was organized. It took over the concessions and, acting through a construction company, began work upon the canal in June 1889. Operations upon a moderate scale and mainly of a preliminary character were continued until 1893, when the financial disturbances of that period drove the construction company into bankruptcy and compelled a suspension of the work. It has not since been resumed. At that time the canal had been excavated to a depth of 17 feet and a width of 280 feet for a distance of about 3000 feet inland from Greytown; the canal line had been cleared of timber for a distance of about twenty miles; a railroad had been constructed for a distance of about 11 miles inland from Greytown; a pier had been built for the improvement of Greytown harbour; a telegraph line had been placed from Greytown to Castillo; buildings for offices, quarters, hospitals, storehouses, &c., had been erected, and wharves and landing-places had been constructed; and a considerable dredging plant had been purchased. In all, about \$4,500,000 had been expended.

Congress continued to take an interest in the enterprise, and in 1895 provided for a Board of Engineers to inquire into the possibility, permanence, and cost of the canal as projected by the Maritime Canal Company. The report of this Board, dated April 1895, severely criticized the plans and estimates of the company, and led to the appointment in 1897 of another Board, to make additional surveys and examinations, and to prepare new plans and estimates. The second Board recommended some radical changes in the plans, and especially in the estimates, but its report was not completed when the revival of the Panama scheme attracted the attention of Congress, and led to the creation in 1899 of the present Isthmian Canal Commission to examine and report upon all practicable routes for a canal across the isthmus. In the meanwhile the property of the Maritime Canal Company has become nearly worthless through decay, and its concession has been declared forfeited by the Nicaraguan Government.

The interest of the United States in an isthmian canal was not essentially different from that of other maritime nations down to about the middle of the 19th century, but it assumed great strength when California was acquired, and it has steadily grown as the importance of the Pacific States has developed. In 1848, and again in 1884, treaties were negotiated with Nicaragua authorizing the United States to build the canal, but in neither case was the treaty ratified. The Spanish War of 1898 gave a tremendous impetus to popular interest in the matter. It seems now to be an article of the national faith that the canal must be built, and, furthermore, that it must be under American control. To the American people the canal appears to be not merely a business enterprise from which a direct revenue is to be obtained, but rather a means of unifying and strengthening their national political interests, and of developing their industries, particularly in the Pacific States and Territories; in short, a means essential to their national growth. The Isthmian Canal Commission created by Congress in 1899 to examine all practicable routes, and to report which was the most practicable and most feasible for a canal under the control, management, and ownership of the United States, reported that there was no route which did not present greater disadvantages than those of Panama and Nicaragua. It recommended that the canal should have a depth of 35

feet and bottom width 150 feet, the locks to be double, the lock chambers to have a length 740 feet, width 83 feet, and depth 35 feet in the clear. The cost of a canal at Panama with these dimensions, built essentially upon the French plans, was estimated at \$156,378,258. A plan, however, was recommended in which the height of the Bohio dam is increased about 20 feet, the level of Lake Bohio raised by that amount, the lake made the summit-level, and the Alajuela dam omitted. The cost upon this plan was estimated at \$143,971,127.

The plan recommended by the Commission for Nicaragua is shown in the map. Beginning at Greytown on the Caribbean Sea, where an artificial harbour is to be constructed, the line follows the valley of the San Juan for 100 miles to Lake Nicaragua; thence across the lake about 70 miles to the mouth of Las Lajas River; then up the valley of that stream through the watershed, and down the valley of the Rio Grande, 17 miles to Brito on the Pacific, where also an artificial harbour is to be constructed. The distance from ocean to ocean is 187 miles. About midway between the lake and the Caribbean the San Juan receives its most important affluent, the San Carlos, and undergoes a radical change in character. Above the junction it is a clear water stream, capable of improvement by locks and dams. Below, it is choked with sand, and not available for slack-water navigation. A dam across the San Juan above the mouth of the San Carlos is to maintain the water of the river above that point on a level with the lake. The line of the canal occupies essentially the bed of the river from the lake to the dam; from the dam to the Caribbean it follows the left bank of the river, keeping at a safe distance from it, and occasionally cutting through a high projecting ridge. The lake and the river above the dam constitute the summit-level, which will vary in height at different seasons from 104 to 110 feet above mean sea-level. It will be reached from the Caribbean side by five locks, the first having a lift of $36\frac{1}{2}$ feet, and the others a uniform lift of $18\frac{1}{2}$ feet each, making a total lift of $110\frac{1}{2}$ from low tide in the Caribbean to high tide in the lake. From the Pacific side the summit will be reached by four locks having a uniform lift of $28\frac{1}{2}$ feet each, or a total lift of 114 feet from low tide in the Pacific to high tide in the lake. The time required to build the canal is estimated at ten years, and its cost at \$200,540,000.

The Commission ended its report thus:—

1. The estimated cost of building the Nicaragua Canal is about \$58,000,000 more than that of completing the Panama Canal, leaving out the cost of acquiring the latter property. This measures the difference in the magnitude of the obstacles to be overcome in the actual construction of the two canals, and covers all physical considerations, such as the greater or less height of dams, the greater or less depth of cuts, the presence or absence of natural harbours, the presence or absence of a railroad, the exemption from or liability to disease, and the amount of work remaining to be done. The New Panama Canal Company has shown no disposition to sell its property to the United States. Should that company be able and willing to sell, there is reason to believe that the price would not be such as would make the total cost to the United States less than that of the Nicaragua Canal.

2. The Panama Canal, after completion, would be shorter, have fewer locks and less curvature than the Nicaragua Canal. The measure of these advantages is the time required for a vessel to pass through, which is estimated for an average ship at twelve hours for Panama and thirty-three hours for Nicaragua. On the other hand, the distance from San Francisco to New York is 377 miles, to New Orleans 579 miles, and to Liverpool 386 miles greater *via* Panama than *via* Nicaragua. The time required to pass over these distances being greater than the difference in the time of transit through the canals, the Nicaragua line, after completion, would be somewhat the more advantageous of the two to the United States, notwithstanding the greater cost of maintaining the longer canal.

3. The Government of Colombia, in which lies the Panama Canal, has granted an exclusive concession, which still has many

years to run. It is not free to grant the necessary rights to the United States, except upon condition that an agreement be reached with the New Panama Canal Company. The Commission believes that such agreement is impracticable. So far as can be ascertained, the company is not willing to sell its franchise, but will allow the United States to become the owner of part of its stock. The Commission considers such an arrangement inadmissible. The Governments of Nicaragua and Costa Rica, on the other hand, are untrammelled by concessions, and are free to grant to the United States such privileges as may be mutually agreed upon.

In view of all the facts, and particularly in view of all the difficulties of obtaining the necessary rights, privileges, and franchises on the Panama route, and assuming that Nicaragua and Costa Rica recognize the value of the canal to themselves, and are prepared to grant concessions on terms which are reasonable and acceptable to the United States, the Commission is of the opinion that "the most practicable and feasible route for" an isthmian canal, to be "under the control, management, and ownership of the United States," is that known as the Nicaragua route.

Other American Canals.—The most important ship canal now in operation in America is the short canal which flanks the rapids in the Sault Ste Marie River, connecting Lake Superior with Lake Huron. The clear dimensions of the principal lock are: length 800 feet, width 100 feet, and depth over mitre sill 21 feet, with a lift of 20 feet. The canal is owned and operated by the United States Government free of tolls. It is closed to navigation by ice four or five months of each year. Its trade during the navigation season of 1899, a period of 231 days, comprised 25,255,810 tons of freight, valued at \$281,364,750, or more than double the traffic of the Suez Canal.

A scheme has been projected for providing a deep waterway from Lake Superior to the Atlantic Ocean, for which surveys and estimates have been made by a Board of Engineers under the direction of Congress. Under this project the channel ways now connecting Lake Huron with Lake Superior, Lake Michigan and Lake Erie, are to be enlarged, and ship canals are to be constructed from Lake Erie to Lake Ontario, and from Lake Ontario to the Hudson River. The former canal leaves the Niagara River at La Salle above the Niagara Falls, and joins it again at Lewiston below the Falls, its length being 9 miles. For 6 miles the entire excavation is through solid rock. At Lewiston the canal ends with a descent of nearly 320 feet by means of eight double locks, of which six have a lift of 40 feet each, and two of 39.4 feet each. The canal from Lake Ontario to the Hudson River leaves the lake at Oswego, passes up the Oswego River to Lake Oneida, uses that lake as a summit-level, cuts through the watershed at Rome, descends the valley of the Mohawk River to Schenectady, and then cuts across country to the Hudson River at Normans Kill near Albany. The length of canal to be constructed is 102 miles, and of river to be canalized 96 miles. The lock chambers are to be 694 feet long and 80 feet wide in the clear. The bottom width of the canal is to be 250 feet. Estimates were made for a depth of 21 feet and also for 30 feet. The former was \$206,358,103, and the latter \$317,284,348.

(O. H. E.)

CANADIAN WATERWAYS.

Canada has the finest system of inland navigations in the world, notwithstanding their liability to being closed by ice in the winter. Previous to confederation the canals were owned by the provincial governments, but after the union of the provinces in 1867 they became the property of the Dominion Government. In 1870 a Commission was appointed to report on a "thorough and comprehensive improvement of the canal system," and after a careful inquiry they reported in favour of large locks and deeper water over the whole of the St Lawrence route, the Welland Canal, and the Sault Ste Marie Canal.

These canals, 70½ miles in length, now form links uniting the great lakes, giving an unbroken water communication from Duluth on Lake Superior, 2260 miles in the interior, Chicago on Lake Michigan, and Detroit, Buffalo, and Toronto on Lakes Huron, Erie, and Ontario, bringing the great wheat-growing districts which border upon the lakes into connexion with the seaboard. The distance from Montreal to Liverpool is 315 miles less than that from New York to the same port. The locks on the improved St Lawrence and Welland Canals are 270 feet long and 45 feet wide, whereas the locks on the Erie Canal, the waterway from the lakes to New York, are much smaller, and have only a depth of water of from 7 to 9 feet, in place of 14 feet on the canals leading to Montreal. Steamers of moderate size are now able to bring cargo direct from Chicago to Europe *via* Montreal; unless the proposed enlargement of the Erie Canal is carried out, a considerable proportion of the grain trade will be diverted from the route to New York to Montreal. The construction of another waterway from Georgian Bay by way of the Ottawa River to Ottawa City, and thence to Montreal, has been sanctioned by the Legislative Council at Ottawa. The St Clair and Lake Erie Canal, in course of construction across the Canadian peninsula between the two lakes, will be 13 miles in length, with a dredged channel in Lake St Clair 19 miles long. This will give a total length of 32 miles, as against 111 miles through the Detroit River.

The lake traffic is very large. In 1890 the tonnage registered at American ports passing through the Detroit River both ways was 21,684,000 tons, and in 1899 it was 30,000,000 tons. Montreal is well equipped for ocean traffic, the depth of water to Quebec being 27½ feet, while the harbour and the channel are being improved to 30 feet, with new docks at the east end of the harbour; large grain elevators and warehouses are also provided. With the view of enabling large steamers to partake of the lake traffic, the Sault Ste Marie Canal has been provided with locks 900 feet long, 60 feet wide, and 20½ feet depth of water, and the American St Mary's Falls Canal has now locks 800 feet long, 100 feet wide, and 21 feet depth of water, enabling large steamers or a number of smaller craft to pass at one lockage.

The navigation of the river St Lawrence has been made easy by the construction of lateral canals with locks, to avoid rocky rapids. The principal ones are the Lachine Canal, 8½ miles with 5 locks, cut through a wide bend in the river near Montreal; the Beauharnois Canal, 11¼ miles long with nine locks, connecting the Lakes St Louis and St Francis; and four other canals, with a total length of 23½ miles with 12 locks.

The Welland Canal connects the waters of the Lakes Erie and Ontario across the Niagara peninsula. It was commenced in 1824 and completed in 1833. In 1842 the Canadian Government bought the canal and at once began improvements. The canal is 27½ miles long, with a total rise of 326½ feet and 26 locks. In 1870 important works were put in hand to enlarge the canal throughout; from Port Dalhousie on Lake Ontario a new channel was cut, 11¼ miles long, to Allanburgh, and from thence to Port Colborne the old canal was enlarged.

The improvement of the waterways of Canada has promoted efficiency and reduced the cost of transit. While railways remain at their original gauge they find they can compete better with the American and Canadian canals by increasing the size of their freight cars, which are now being built to carry 30 to 40 tons, against 8 to 10 tons (the ordinary standard size). Shipowners find that the cost of transport is diminished by an increase in the size of their steamers, and the returns of the Board of Trade

show how rapidly the increase has been growing. This applies equally to the cost of transit on inland waterways, and it is only by following the example set by other countries in improving their canals that manufacturers and traders will gain the benefit of low rates of carriage.

(E. L. W.)

INLAND NAVIGATION.

Lord Bacon wrote: "There be three things which make a nation great and prosperous, a fertile soil, busy workshops, and easy conveyance for men and commodities from one place to another." Inland navigation certainly provides the most easy and the cheapest mode of conveyance for minerals and goods, and the last quarter of the 19th century saw great improvements in canals and navigable rivers, more particularly in France, Belgium, Germany, and Canada. But, generally speaking, England has been indifferent to this important question, and the railway companies have been allowed to purchase the canals, with the result that they now possess 1139 miles out of a total length of 3907 miles of navigations in that country. Some of these railway-owned canals are links in main lines of communications, and independent canals in the route are therefore blocked from carrying out improvements that would assist through traffic, by deepening their waterways and enlarging the locks so as to admit of increase in the size of boats, a work which on the continent of Europe has been found efficient in reducing the cost of carriage. The maintenance of the railway-owned navigations is often much neglected, and generally they are useless for the purpose of active competition. The Board of Trade returns of canals and navigations for the year 1898 show that while the traffic on the independent canals had increased five million tons in Great Britain since 1888, the traffic on the railway-owned canals had decreased two million tons in the same period. There may be agricultural districts where the traffic would not justify the cost of bringing the early canals up to the standard of the improved navigations of the present day, but main lines of canals from large manufacturing or mineral districts, capable of taking large barges in trains towed by steam-power, would greatly benefit traders, who now undergo severe competition from other countries that have improved their waterways as being the most economical means of giving cheap carriage of minerals and goods. Mr Samuel Lloyd has proposed taking Birmingham, with its large manufacturing and coal and iron industries, as a centre, and joining it with the rivers Severn, Thames, Mersey, and Humber, by improved canals which, passing through other important districts, would convey exports and imports to and from the principal ports on the English coast and serve local trade.

Canalized Rivers.—Before canals were introduced in Great Britain, locks and weirs were constructed in rivers to improve the navigation, and the increased depth thus obtained, together with the water-power gained at the weirs for mills, was of great advantage. Previously, in dry weather, it was difficult to navigate the rivers, even with diminished cargoes, while the long deep pounds between the locks on the improved navigation provide ample water for lockage-power and form natural reservoirs for dry seasons.

The first Act for the improvement of a river was for the Thames in the year 1423, and since that date nearly forty Acts relating to it have been passed. The earliest locks and weirs appear to have been made by the owners of adjoining lands, more with a view to obtain mill-power than to improve the navigation, and heavy charges were levied by the landowners for the use of the locks, which were of the rude type termed flash-locks.

In 1730 the river was placed in the hands of Commissioners, with power to levy tolls and construct new locks and weirs; it is now a good barge navigation, notwithstanding the abstraction of a large proportion of the summer flow by the London Water Companies. As it does not pass through any mineral or manufacturing district of importance, the trade on the upper river is not large. Below Richmond, sluices and a lock have been erected across the river to maintain deeper water in the reaches above; they are of the same type as those described in use on the Manchester Ship Canal, except that when raised they take a horizontal position instead of a vertical one. In 1783 an Act was passed authorizing the construction of a canal 40 miles long to unite the Thames and Severn, beginning at Lechlade in Oxfordshire and terminating at Frampton-on-Severn, Gloucestershire. The canal was worked successfully for many years, but had been allowed to fall into a state of disrepair. In 1895 a public trust was formed for the purpose of restoration, and the works have been extensive, including powerful steam-pumps for providing a better supply of water to the summit-level, which is 353 feet above the sea, about midway between Stroud and Cirencester.

The river Severn is navigable from Shrewsbury to Gloucester. Acts relating to it were passed from 1503 to 1811, mainly to meet the cost of maintenance and other charges on the towing-paths, and it was not until the year 1842 that a body of Commissioners, representing the various interests on the river, were appointed to raise money on the security of the tolls and improve the navigation. Locks and weirs were constructed between Stourport and Worcester, a distance of 12 miles, and thence to Gloucester (28 miles); dredging and embankments only were employed, because a permanent raising of the level of the river so as to give a navigable depth of 6 feet was objected to by the landowners, as floods often occurred in winter, sometimes rising 18 feet above summer level. It was held by the promoters' engineers that by the proposed plans, which showed long weirs placed obliquely to the current in widened portions of the river, with locks in cuts, the floods would be carried off as rapidly as before, owing to the enlarged width at the weirs and the increased velocity of the floods, which would first pass over a deep channel and an almost vertical weir, instead of a shallow bed with shoals. Eminent engineers gave evidence against this view when the Bill was before the Parliamentary Committee, and it was decided that no locks or weirs were to be built below Worcester. From Worcester to Gloucester the shoals were dredged out, a million tons of marl and gravel being removed, with the result that although only a narrow channel had been cut through the shoals, the removal of those natural weirs caused the summer water-level at Diglis locks, near Worcester, to fall 3 feet. After protracted struggles in Parliament, an Act was obtained in 1853 to construct a lock and weir at Tewkesbury, about half-way between Worcester and Gloucester, and in 1869 further powers were got to construct locks and weirs near Gloucester. These powers were obtained largely by the evidence of landowners above Worcester, who proved that instead of the erection of the weirs damaging the land, as was expected, floods, on the contrary, did not occur so frequently, and passed off the land more rapidly. The canalization of the river was then completed, and there is now a minimum depth of 10 feet of water at all seasons from Gloucester to Worcester, enabling vessels of 300 to 400 tons to reach the latter city. The Severn navigation is an important link in the chain of navigation between the ports of the Bristol Channel and the Midland districts. It connects the Gloucester and Berkeley Ship Canal at Gloucester with

the narrow Worcester and Birmingham Canal, which is now the property of the Gloucester and Berkeley Canal, the Midland Railway Company having failed to get powers to purchase it. At present the large Severn barges have to tranship their cargoes into small canal boats at Worcester, and the question of increasing the size of the canal to Birmingham is under consideration.

The Aire and Calder Navigation was authorized by an Act passed in 1698; other Acts of later date gave additional powers for enlarging the navigation, and it is now one of the best English waterways, giving communication between Lancashire and Yorkshire and the ports of Goole and Hull. Its original capital was £150,000, but the amount expended to the year 1898 was £2,761,807. Its total length is 85 miles, part river and part canal, with 31 locks. Commencing at Goole, it terminates at Leeds with a junction with the Leeds and Liverpool Canal, thus forming a continuous navigation from the east to the west coasts. At Castleford it has a branch to Wakefield, where it joins the Barnsley Canal. Originally the navigation was only 3 feet 6 inches deep, but since 1860 great improvements have been carried out, the locks being made 215 feet long, 22 feet wide, with 9 feet of water on the sills. All overhead bridges have been enlarged to the width of the locks; vessels carrying cargoes of 170 tons can now use the navigation, and three 50-ton barges can pass the locks together. Merchandise is generally carried in barges towed in trains by steamers, which also carry goods, but the large coal traffic is conveyed in trains of boat compartments, either towed or pushed by steamers, on a system designed by Mr W. H. Bartholomew. The boats, except the leading one, which has an ordinary bow, are nearly square in shape; they are coupled together by knuckle joints fitted into hollow stern-posts, and they can thus move laterally or vertically; a wire rope in tension on each side of the boat enables the train to be steered. No boat crews are required, the crew of the steamer regulating the train. If the boats do not exceed eleven in number, they can be pushed, but beyond that number they are towed. Each compartment carries 35 tons, and the total weight in a train varies from 700 to 900 tons. On the arrival of a train at Goole the boats are detached, and are each taken over submerged cradles under powerful hydraulic hoists, which lift boat and cradle sufficiently high to enable it to be turned over, and discharge the whole cargo at once into a shoot, and thence into sea-going steamers. Goole has become an important port owing to the improvements of the Aire and Calder Navigation Company, who have constructed docks of 24 acres in extent to give accommodation to foreign and coasting steamers.

The River Weaver Navigation is about 20 miles in length. This river rises in the south-west corner of Cheshire, passing through the salt districts of Winsford and Northwich, and joins the Mersey at Frodsham. It is made navigable between those places under the powers of an Act of 1721, which ordered that any profits were to be employed in repairing public bridges, and meeting other public charges in the county of Chester; considerable sums have been paid accordingly. Subsequent Acts enabled a canal to be made, 4 miles in length, to avoid the lower tidal portion of the river, and to obtain a better entrance on the Mersey at Weston Point, where docks have been constructed. Other cuts were made to shorten the course of the river, and the depth was increased to 7 feet, enabling craft of 100 tons to use the navigation, their cargoes being principally salt for shipment at Liverpool. An Act was obtained in 1866 authorizing further improvements, which have since been

completed, with the result that it is the best navigation in England for small coasters and large barges. The locks are in pairs, the largest being 220 feet long by 42 feet wide, with 15 feet depth on the sills; at present the river dredging has not gone beyond 10 feet 6 inches in depth. Canalized rivers have the advantage of a good supply of water, even for large locks, and on the river Weaver there are also large natural reservoirs, formed by the subsidence of the ground owing to salt workings and brine-pumping. The locks have intermediate gates, so as to shorten them when only single vessels have to pass; otherwise the locks can take a steamer, carrying cargo and towing barges, with total cargoes amounting to 600 to 800 tons. The lock gates are worked by turbines, thus utilizing the fall at the locks and the ample supply of water. The effect of the new works has been to secure the whole of the large export salt traffic to Liverpool and other ports, the railways not being able to compete with the low cost of carriage on such an improved waterway.

France.—M. Freycinet, when Minister of Public Works, stated, in a report on the rivers and canals of France: "Navigable waterways play an important part in the production of the wealth of a country. It has been found that navigable waterways and railways are not destined to supplant but to support one another. Each has its particular attributes. Railways take the least cumbersome traffic—that which requires speed and regularity and bears most easily the cost of carriage. Waterways take heavy goods of low value, and their mere existence checks and moderates the rates on goods which are sent by railway." The principle thus laid down has been fully accepted in France, where the waterways, 7459 miles in length, are the property of the State, only 158 miles remaining in other hands. The navigations are divided into two classes, main and secondary, the main ones having a minimum depth of 6½ feet, with locks 126 feet long and 17 feet wide; the second class are of smaller dimensions.

The improvements in the river Seine have made it a most important waterway. Not to mention the embankments and training walls, which with dredging have had such important results in enabling large steamers to reach Rouen, the upper portion of the river from that place to Paris affords a good example of a modern canalized river, although it is so winding that its length of 150 miles between Rouen and Paris is more than double the distance between those cities measured in a straight line. On this portion of the Seine locks and weirs had been constructed between 1838 and 1866, but they only gave a navigable depth of 5 feet. In 1878 new works were authorized to secure a depth of 10½ feet, and so enable vessels of 800 to 1000 tons to reach Paris. These works have been completed, dividing the river into nine reaches by locks and weirs of large size, the level of the highest pound being about 85 feet above high water of the lowest tides which reach the first lock above Rouen. Although the railway competition is severe, the lower cost of water carriage secures a traffic of over four million tons a year. The navigation is toll-free, and the improvements have cost the State £2,500,000. At Rouen the cargoes of shipping for Paris and the interior are discharged into lighters, carrying from 300 to 900 tons each, which are towed by steam tugs; the locks are able to take trains of barges which pass up the first-class navigations beyond Paris. Steamers trade between London and Paris, but their size is restricted by several low bridges which have yet to be altered.

The river Saône has been canalized for a length of 231 miles as a first-class waterway, with a depth of 6½ feet. The most important canals in France have been enlarged to a similar depth, the locks being 126 feet long and 17 feet wide, and barges capable of carrying 300 tons now traverse

the main navigations. The first-class waterways in 1878 were 765 miles in length; in 1897, 2795 miles were first-class, including 401 miles of new canals. The saving in cost of carriage on first-class waterways is due to the fact that a barge of 200 to 300 tons is worked at almost the same expense of crews and haulage as one only able to carry half that cargo. This has led to the great improvements in the waterways of the Continent.

Belgium.—The total length of waterways in Belgium is 1242 miles, 341 being canalized rivers, 301 open rivers, 457 miles of canals for barges of 200 tons and upwards, and 143 miles of smaller canals. The State owns about 85 per cent. of the whole. All improvements are carried out to standard dimensions, the locks being 134 feet long and 17 feet wide, with a canal depth of 8 feet. Since the improvement of the waterways the traffic on them has largely increased, notwithstanding the complete system of railways which are *pro tanto* relieved of the heavy and slow traffic.

Germany.—Inland navigation has been fostered and improved by the State, and between the years 1880 and 1893 £17,875,350 was expended for the creation of new or the improvement of existing waterways. In 1895 their length was 6214 miles. It has been proposed to construct a Midland canal to connect the Dortmund-Ems Canal with the Rhine on one hand and the Weser and the Elbe on the other;¹ this development is supported by the industrial interests, but is opposed by the Agrarians, who fear that new waterways will promote the increased import of foreign grain. The result of improvements has been to make nearly all the waterways available for steamers or steam-towing. On the Rhine the size of vessels has increased from 800 to 1300 tons and upwards, while on the Elbe and the Weser it is possible to carry nearly twice as much cargo as formerly. On the Oder the barges to and through Berlin could only carry 150 to 200 tons, while vessels of 500 to 600 tons now go direct from Breslau to Hamburg. The State levies tolls on the canals and canalized rivers amounting to about one-third of the cost of maintenance, but the tolls have not prevented a large increase in the amount of traffic.

Steam Haulage.—On the Bridgewater Canal, which has a large traffic between Liverpool and Manchester, steam tugs have been introduced, with the result that the traffic is conducted with greater regularity and despatch, and with, as compared with horse traction, a saving of forty per cent. in cost. Experiments were first tried by hauling on a submerged wire rope which passed round a drum worked by steam-power on a tug; this system has succeeded on some wide navigations, but it failed on the

Bridgewater Canal, owing to its interference with other traffic and the difficulty of keeping the wire rope in the centre of the canal round sharp curves. Steam tugs were then tried with complete success, although the depth of water in the canal does not allow of larger screws than 3 feet 4 inches in diameter. Twenty tugs are now employed, each 61 feet long, 7 feet 6 inches beam, and 4 feet draft; each can tow four barges at the rate of nearly 3 miles an hour, the barges carrying cargoes of 40 to 50 tons each. The canal has the advantage of being without locks between Runcorn and Manchester, a distance of thirty miles.

Electric Haulage.—Electric haulage has been successfully used in France upon part of the Bourgogne Canal, including a tunnel over 2 miles long. It is also employed on the Charleroi Canal in Belgium, which connects the coal district with Brussels. The canal is a narrow one, and barges towed by horse-power seldom reached a speed of 1½ miles an hour. The use of electric power has given a speed of 6 to 7 miles an hour at the same cost per mile. There are two generating stations, one 15 miles south of Brussels and the other at Roux, 6 miles north of Charleroi. The electric current is taken from overhead wires, and it also serves for lighting purposes and for working machinery at manufactories on the route of the canal, thus reducing the cost of towing by the profit made by adapting the current to secondary uses. The working of the locks is also facilitated by the use of electricity. It is very probable that electric traction will be largely used in the future for haulage on canals; it would also be useful for working wharf cranes or canal lifts.

Lifts.—Where the levels of the ground for a canal are such as to require several locks near each other, lifts or inclines have been adopted instead of locks, to save time in passing traffic, and also to economize water, which in dry seasons has on some canals to be pumped back again by steam-power from the lower to the upper level. The most improved type of lift is that at Anderton on the Weaver Navigation; it was constructed to unite the Trent and Mersey Canal with the river, where the navigations are in close proximity but with a difference in level of 50 feet, the canal having no spare water for locks. The lift is a double one working vertically, barges up to 100 tons being transferred from the canal at the high level to the river in ten to fifteen minutes; the change is made while the barge is floating in an iron trough full of water with gates at each end. The descending trough has more weight, owing to 6 inches of water being removed from the lower trough by self-acting siphons; this gives power to the descending trough to raise the lower one, a hydraulic accumulator being used to overcome the loss of weight in the descending trough when it is immersed in the river at the lower level. The troughs are supported and worked by two cast-iron rams, 3 feet in diameter, placed under the centre of the trough, with cast-iron presses connected with a 5-inch pipe, the weight of trough and water being 240 tons. The lift was completed in 1875, and has continued to work well even in hard frosts.

Similar lifts have since been erected on the Continent. The one at Fontinettes on the Neufosse Canal in France is capable of lifting vessels of 300 tons burden. Another lift at La Louvière on the Canal du Centre in Belgium is able to lift vessels of 400 tons, the total weight lifted being 1037 tons. Three other lifts of the same character are being constructed on this canal.

The two largest lifts yet constructed are those on the Trent Canal at Peterborough in Canada; the vertical traverse is 65 feet, and the tanks are 139 feet long by 33 feet wide, with 8 feet depth over the sills. They are double, like those at Anderton already described, being worked in

¹ The canal is intended to run *via* Minden, Hanover, Gifhorn, and Wolmirstedt, to Heinrichsburg on the Elbe, opposite one of the extremities of the Plane Canal, which goes on to give connexion with the Havel and the Spree, and through these rivers and their connecting canals with the Oder and the Vistula, so that by this means a connected inland waterway, stretching east and west, will be made between the Rhine and the Vistula. The length of the Midland Canal section is estimated at 202 miles, its width at bottom at 59 feet and at the surface at 108½ feet, the depth at 8½ feet, the width of the sluice gates at 28½ feet, and the length of the locks at 220 feet. The highest point (185½ feet) which the canal (as projected) would traverse lies only 22½ feet above the terminus at Bevergern and 57½ feet above the Elbe terminus near Wolmirstedt. From the main canal it is proposed to construct branch canals to the towns of Osnabrück, Hildesheim, Peine, Brunswick, and Magdeburg, making an additional (total) length of 69 miles. The estimated cost of the main canal amounts to £6,250,000, of the branch canals at £2,150,000, or altogether a total of £8,400,000. A canal 13 miles long, starting from the Weser near Rinteln, will be chiefly relied upon to furnish the water supply of the new canal. Closely connected with this Midland Canal, and really a continuation of it, is the Rhine-Weser-Elbe Canal, the Dortmund-Ems Canal forming the intermediate link between the two.

a similar manner on hollow cast-iron rams $7\frac{1}{2}$ feet in diameter, working in hydraulic cylinders built up of rings of steel castings $3\frac{1}{2}$ inches thick, bolted together by external flanges. Pumps driven by turbines, operated by water taken from the upper reaches of the canal, work an accumulator which supplies the hydraulic plant used to move the gates closing the tanks and branches of the canal leading to them, and also capstans for handling the barges in or out of the tanks.

Canal inclines were early adopted on canals where loss of water in lockage was of importance. The Monkland Canal incline near Glasgow has a rise of 96 feet on a gradient of 1 in 10, and takes the place of eight locks which were insufficiently supplied with water in dry seasons. A carriage with twenty wheels runs on each line of a double way of 7 feet gauge, carrying a water-tight wrought-iron caisson 70 feet long, 13 feet wide, and $2\frac{3}{4}$ feet deep in a horizontal position on the incline by elevating the lower end of the carriage. The caissons are filled with water and balance each other; they act like movable locks with gates, one ascending as the other descends, moved by engine-power working two vertical drums, round which is coiled the wire rope that hauls the ascending load, which is nearly counterbalanced by the descending boat. In order to prevent the boat from moving in the caisson, it does not float freely when on the incline, but rests on the bottom of the caisson, partially supported by water. The time taken for the whole operation is ten minutes, the saving in time being about half an hour for each barge.

The Grand Junction Canal Company have constructed an incline at Foxton on the Union Canal to take barges of 70 tons, or two canal boats of 33 tons, in place of ten locks, which were necessary to overcome a rise of 75 feet. It is in some respects like the Monkland Canal incline, but the movable caissons work on four pairs of rails on an incline of 1 in 14 broadside on, in consequence of the steeper grade, the boats being water-borne during the whole time. Steam-power is employed with an accumulator, which enables hydraulic power to be used in keeping the caisson in position at the top of the incline while boats are being moved in or out, a water-tight joint being kept against the fixed portion of the canal during the operation. The gates in the caissons and canal are also worked by hydraulic power. The incline is capable of passing 200 canal boats in twelve hours, and the whole plant is worked by three men.

Canandaigua, a village of New York, U.S.A., and capital of Ontario county, situated in the western part of the state, at an altitude of 735 feet. It has two railways, the New York Central and Hudson River and the Northern Central, and owing to its situation at the outlet of the beautiful Canandaigua lake, has become a summer resort. Population (1880), 5726; (1890) 5868; (1900), 6151 (834 foreign-born, and 110 negroes).

Canary Islands or Canarias, a Spanish archipelago in the Atlantic, about 60 miles W. of the African coast, consisting of 7 large islands and 6 smaller, the latter uninhabited. The total area of the archipelago is 2944 square miles. The population in 1877 was 283,532, in 1897, 334,521. The archipelago forms one Spanish province, of which the capital is Santa Cruz de Tenerife, the residence of the civil governor, who has under his command one of the two districts into which the archipelago is divided, this first district comprising Tenerife, La Palma,

Gomera, and Hierro. The other district includes Gran Canaria, Lanzarote, Fuerteventura, and has at its head a sub-governor, residing in Las Palmas, on Gran Canaria, who is independent of the governor except in regard to elections and municipal administration. The province is divided into 7 administrative districts and 90 parishes. The chief Finance Office is at Santa Cruz de Tenerife. The Court of Appeal, created in 1526, is in Las Palmas, which is also the residence of the Bishop of Canarias. The captain-general and second commandant of the archipelago reside in Santa Cruz de Tenerife, and there is a brigadier-governor of Gran Canaria residing in Las Palmas, with 8 inferior military commandants in other isles and forts. The province furnishes no men for the Spanish peninsular army, but its annual conscription provides men for the local territorial militia of Canarias, composed of regiments of infantry, cazadores or rifles, squadrons of mounted rifles, and companies of garrison artillery—about 5000 men all told. The archipelago is divided into 2 naval districts, commanded by royal navy captains. The principal means of communication is by sea. Some shipbuilding is carried on, mostly in Las Palmas. The sugar manufactures are yearly increasing, above all in Gran Canaria. Fishing is the principal industry, employing nearly 10,000 hands, on 2200 boats averaging below 100 tons. This fishing fleet operates over 600 miles near the north-western African coast. In 1898 wheat was grown on 138,295 acres, oats, barley, maize, rye on 130,277 acres, pod fruit on 3435 acres, and vines on 7837 acres. Though the soil is fertile, agriculture is not on the whole in a prosperous condition. The islands are not very rich in live stock, as the official statistics for 1898 only showed 2492 horses, 2380 mules, 4111 asses, 10,900 cattle, 1455 pigs, and 29,467 sheep. There were also 44,895 goats, most of which live in an almost wild state in the hilly parts of the islands. Game is abundant in some districts, especially rabbits, hares, some wild duck, and small deer. Reptiles are quite unknown, though lizards are very numerous. England is at the head of the import trade in coal, cotton textiles, and woollen goods, blankets, hardware, iron, timber, soaps, candles, and colonial products. France introduces sulphur, shoe leather, and *articles de Paris*; Germany, earthenware, hardware, spirits, paper, and cotton goods; Belgium, cement, starch, and glass. The principal exports are tomatoes, of which £67,350 were shipped in 1898; and bananas, £10,500. In all, imports were valued at £280,942 in 1897, and £46,551 in 1898; exports at £150,577 in 1897, and £204,796 in 1898.

Cancer.—Cancer has been the subject of much exact investigation, and of a still larger amount of theory and assumption. It is important to distinguish between them. The following points deserve notice: (1) prevalence, (2) causation, (3) distribution, (4) treatment.

The question of most general interest is the alleged increase of the disease. The belief that cancer has increased, and is increasing rapidly, rests upon two pieces of evidence—the impression formed by surgeons from their own experience, and the Registrar-General's mortality returns. The first is obviously mere opinion, the value of which depends on the number of individuals holding it and the extent of their experience. If it were the universal or the general experience of the medical profession that cancer is more frequently met with than formerly, the testimony would carry great weight, but there is no evidence of any such experience. The fact that a limited number of practitioners have of late years met with an increased number of cases, or that more cancer patients have found their way into certain hospitals, is of little value. It may be

Prevalence.

due to accident or to extended practice. Impressions derived from such *data* have often proved to be fallacious, and no weight should be attached to them in themselves. The Registrar-General's returns stand on a different footing, and merit very careful attention. On the face of them, the statistics show an enormous increase, and similar records in other countries tell the same tale. "In England and Wales," says Dr Roswell Park, Professor of Surgery in the University of Buffalo, "the cancer death-rate has risen from 1 out of 5646 of population in 1840, to 1 out of every 1306 of population in 1896; that is, in fifty years the proportion has increased nearly five times. All over this country the increase is quite as alarming." In England and Wales the mean annual death-rates per million living for the ten years 1861-70 were—males, 242; females, 519; in 1891-97 they were—males, 571; females, 882, showing an increase of 136 per cent. and 70 per cent. respectively; and in 1899 they had further risen to—males, 672; females, 977. Again, the registered mortality for both sexes in the five years 1891-95 was 712 per million; in 1896 it had risen to 764 per million, and in 1899 to 829. At first sight this great and progressive increase looks conclusive, but there are sound reasons for doubting if it represents a real increase in the prevalence of cancer. In any case the Registrar-General's figures must be largely discounted. In the first place, it has been pointed out that since cancer is a "disease of degeneracy, the frequency of which increases as age advances" (Paget), a rise of mortality from this cause would naturally follow on the greater longevity which has been attained in recent years, and the survival of more persons to cancer age. In particular, Dr J. F. Payne has pointed to "the greatly diminished mortality from phthisis and from infectious disease. Since both these causes of death act much earlier in life than cancer, in proportion as they carry off a small number of persons at earlier ages, a larger number will survive so as to be the victims of cancer at a later period of life." That, no doubt, is so, but Dr Newsholme has shown, by a careful comparison of the figures, that survival can only account for a small proportion of the cancer increase. The same statistician points out a far more important source of error, which applies also to other causes of death that show an apparent increase. The Registrar-General's returns are based on the death certificates signed by medical men, and only represent the certified, not the actual, causes of death. They are imperfect, inexact, and liable to a considerable amount of error. In the past the imperfection and margin of error was much larger than in later years. With improved knowledge and greater care the returns tend to become more accurate, and the large number of deaths certified from indefinite causes constantly diminishes. For instance, the number of deaths so certified in 1866-68 was 143,472, and in 1894-96 only 68,650. This diminution represents an addition of 74,822 deaths ascribed to various causes, and it is quite certain that a large proportion of such additional certifications go to the credit of cancer. In 1889, as the result of special inquiries made by the Registrar-General, 421 deaths were transferred to cancer, and in 1896 the transfers rose to 597, and in 1899 to 760. This factor makes the comparison between earlier and later periods quite untrustworthy. The influence of improved diagnosis in swelling the cancer returns is clearly shown by the fact that the apparent increase is far greater among males than among females, for which no reason can be assigned except that cancer in men is more often internal and difficult of diagnosis, and was therefore less frequently diagnosed in former years. This view is further confirmed by the carefully classified records kept for twenty-seven years at Frankfort-

on-Main. During that period cancer of "accessible" parts remained stationary, that of "inaccessible" parts showed a large increase. The difference can only be explained by improved diagnosis. Whether this is sufficient to account for the whole of the apparent increase, it is impossible to say at present. As the returns improve in accuracy the factor will drop out, and if it is responsible for the whole of the increase, that will tend to cease *pari passu*. This does in fact seem to be happening, at least in Great Britain, for the rate of increase is less year by year. In other countries the mortality returns are certainly neither more complete nor more accurate, and it is highly probable that the same calculation applies equally to them. On the whole, it must be held that though there has probably been some increase, it has not been satisfactorily proved and is certainly less than is supposed.

The rise of the parasitic theory of infectious disease has given a great impetus to the study of cancer from the point of view of causation. It has been shown **Causation.** that there are in cancers certain microscopic bodies peculiar to cancer, and possibly of a parasitic nature. In some cancers they are present in enormous numbers. They have been isolated and cultivated outside the body. The cultures, when introduced into certain animals, have caused death with the production of tumours resembling cancer, from which again cultures have been made producing similar growths on inoculation. The existence of these bodies may be taken to be proved, but their nature and significance remain still undetermined. It may be that their presence is the exciting cause of that abnormal growth of the natural cells which constitutes cancer, or, on the other hand, it may be merely a stage in the process. In any case their origin is quite unknown, and if cancer be infectious at all, both experience in nature and experiment go to show that its infectivity is of a very low degree. It should not be forgotten that cancer is essentially a disease of old age, and that the incidence of all known diseases of a micro-parasitic nature affects rather childhood and early adult life. With regard to the influence of heredity, the trend of modern research is to minimize or deny its importance in cancer, as in phthisis, and to explain family histories by locality or other conditions. In view of the wide hold obtained nowadays by popular fallacies through the agency of elementary education and a cheap press, it may be not superfluous to add that there are no reasons for supposing that tomatoes have anything whatever to do with cancer.

Several years ago Mr Haviland investigated the distribution of cancer in England and Wales, and disclosed the existence of what he called "cancer fields," that is, districts in which the disease prevailed in a **Distribution.** marked degree. Such districts were invariably associated with "seasonally flooded areas traversed by, or in close propinquity to, fully formed rivers," and were geologically characterized by alluvial and clayey soils. On the other hand, districts having the lowest mortality were found to be situated on elevated lands, well drained, not subject to floods and geologically characterized by the Carboniferous limestone formation. He has more recently returned to the question, and by comparing a later period with the former one, has shown that this distribution remains constant, though the mortality has everywhere increased. Incidentally it may be remarked that the fact of the increase being generally distributed, and not confined to cancer districts, is an additional reason for regarding the increase as only apparent. Mr Haviland concludes that flooded clays are always associated with the highest mortality, and limestones with the lowest. The Thames valley, which is the greatest cancer field in England,

forms the most striking illustration of this generalization. The river flows through a great variety of geological formations, but all the localities having the highest cancer mortality lie on clays, and are liable to floods; those having the lowest lie on limestone and chalk, and are, for the most part, not subject to flooding. Further light has been thrown upon the subject by the investigation of localities and houses to which the term "cancer-haunted" has been applied. Certain spots, groups of buildings and single houses, seem to harbour some special liability, and that independent of their size and age. An investigation carried out by Mr d'Arcy Power in a cancer district produced some remarkable examples. In one case, three men occupying the same house in succession all died of cancer since 1877, when the earliest case occurred. It was a new house then, built on land which had been pasture, and its first occupant was the first victim. The third was only thirty-six years of age. In another instance three cottages were under one roof, and in each of them a case of cancer occurred within six years. Many other similar instances have been recorded, and it is difficult to deny the existence of some local influence. But whether it lies in a predisposition engendered by the situation, or in the harbouring of a parasite in the soil, or in some intermediate host, is at present mere subject of conjecture. Animals do not appear to play any part in the matter. Cancer has been observed in horses, dogs, cattle, cats, and sheep, in the relative frequency named, but it is not very common in any of them. With regard to occupation, the following comparative mortality figures are given by the Registrar-General:—All occupied males, 44; all unoccupied males, 96; grocers, 34; clergy, 35; potters, 35; coal-miners, 36; farmers, 36; fishmongers, 42; medical practitioners, 43; blacksmiths, 45; fishermen, 46; porters, 48; general labourers, 48; drapers, 49; shoemakers, 50; dock and wharf labourers, 51; tobaccoconists, 51; plumbers, 53; innkeepers, 53; coal-heavers, 56; butchers, 57; coachmen and grooms, 58; tool and scissors makers, 58; gas-workers, 59; lawyers, 60; merchant seamen, 60; maltsters, 61; commercial travellers, 63; inn and hotel servants, 65; brewers, 70; innkeepers in London, 70; chimney-sweeps, 156. An examination of these figures is very suggestive. They appear more or less incompatible with any existing theory. Mental worry and overwork seem to be negatived by the low position of doctors, who come below labourers, fishermen, and seamen. The great differences in occupational incidence are not in accordance with either a parasitic or a local theory, while the moderate place—considerably below lawyers—taken by innkeepers is quite at variance with the suggestion that alcohol is responsible. Why should lawyers be more susceptible than clergymen and doctors? They are not so long-lived as the former, so that old age cannot account for the greater incidence, and both less intemperate and less worried than the latter. It looks very much as if chance had more to do with the matter than anything else; but there is the one striking fact of the enormous susceptibility of chimney-sweeps, which is too great to be explained by chance. The well-known and long-recognized frequency of cancer in this particular class used to be advanced as proof of the hypothesis of local irritation, which is still the orthodox explanation of cancer. The soot is supposed to act as an irritant; but, if so, why are potters and coal-miners, who also work in irritating materials, so very low in the cancer scale? No doubt the case of the chimney-sweep contains one of the keys to the problem of cancer causation, but it has not been found yet.

The only "cure" for cancer remains removal by operation. There is some ground for claiming that improvements in surgery offer a better chance of complete

cure in favourable cases, and of a longer respite in others. A number of drugs, including inoculations with thyroid extract and toxins, have been tried, but such methods of treatment are only in the nature of experiments. Change of residence from a clay to a chalk soil is worth trying after removal by operation. (A. SL.)

Treatment.

Candon, a town in south Ilocos province, near the west coast of Luzon, Philippine Islands, in 17° 4' N. Its climate is hot, though healthful. It is surrounded by an extensive and fertile plain, and is defended by a small fort. Its inhabitants are noted for their honesty and industry, as well as for their regard for law and order. They carry on an extensive traffic with the wild tribes of the neighbouring mountains. Indigo is grown in considerable quantity, as are rice and tobacco. The weaving of blankets, handkerchiefs, and cotton and silk cloths constitutes quite an important industry. The language is Ilocano. Population, 15,700.

Cangas de Onis, a township of the province and diocese of Oviedo, with a population in 1897 of 9507, situate in a fertile, well-watered, partly wooded, undulating region. Its trade is chiefly in live stock and products of neighbouring copper and coal mines. It has good buildings, a foundling hospital, schools, a town hall with a Latin inscription recording the fact that this place was the residence of the first kings of Spain after the spread of the Moors over the peninsula. Here early in the 8th century lived King Pelayo, who started the Christian reconquest of Spain. His historic cave of Covadonga is only 8 miles distant. The church of the Assumption, rebuilt in the 19th century, is on the model and site of an older church of the Middle Ages. Near Cangas are ruins and bridges of the Roman period.

Cannanore (KANANORE), a town of British India, in the Malabar district of Madras, on the coast, 58 miles N. from Calicut. The population in 1881 was 26,386, in 1891 it was 27,418; the municipal income in 1897-98 was Rs.28,450. Here is the residence of the Mopla chief, known as the Ali Raja, who owns most of the Laccadive Islands. Cannanore is the headquarters of a military division. It has a municipal high school and reading-room. A railway is under construction from Calicut.

Cannes, a town of France, in the arrondissement of Grasse, department of Alpes-Maritimes, on the coast, 23 miles in direct line S.W. of Nice, and on the railway from that town to Toulon. The town, which has steadily grown in favour as a winter health resort, was several times visited by Queen Victoria. In 1899, 382 vessels of 47,421 tons (including those engaged in coasting trade) entered the port, and 368 of 48,046 tons cleared. The trade is mainly in French hands. Population (1881), 14,086; (1896), 28,591; (1901), 34,151.

Canning.—By canning is meant the preparation of food in packages of tin or glass so as to preserve it indefinitely with its natural flavour and nutritive properties uninjured. To this end it is necessary that the food should be hermetically sealed and the bacteria or germs that cause fermentation be destroyed. The process was developed and given a commercial value by Nicolas Appert in France in 1807-10. Until recently it was thought that the spoiling of hermetically sealed food was due to the presence of air in the tins or jars, and the process of sterilization was carried on by cooking in an open water bath, at a temperature of 212° F. It is now known that fermentation is caused only by the presence of bacteria or micro-organisms; if these are destroyed and the food

sealed against them, the presence of air would not of itself cause fermentation, provided it were sterilized. To destroy bacteria the food is heated to a sufficiently high temperature under pressure in retorts and kettles. Heat is the only agency that need be employed. The use of antiseptics is inexcusable.

While the process of canning is simple, extreme care is required in handling the material. Bacteria lodge upon food from utensils; they are in the water-supply, in the air, perhaps in the fluids used in the process of canning; and on the person or garments of workmen. Cleanliness is imperative. Moreover, certain forms of bacteria are not killed as easily as others, and unless the packer knows how long the food should be cooked and how high a temperature is necessary for sterilization, he is liable to lose an entire season's product. Fortunes have been lost through lack of cleanliness or of a knowledge of bacteriology. The simple process devised by Appert has been developed by applying steam and machinery to all parts of the work from the cultivation, gathering, preparation, and packing of raw material to the manufacture of tin cans, labels, and cases. Among the devices in common use are automatic can-making machinery, cappers, fillers, floaters, brining or syruping machines, wipers, corn cutters, corn silkers, pea briners, hullers, corn cookers, conveyers, labelling machines, and box fillers; a portable process kettle has made canning possible on the farm. In treating peas, for example, the work was formerly done by hand and the peas twice cooked; after being subjected to heat for ten minutes at 212° F. the tins were vented, resealed, and again processed. By the aid of modern machinery the pods are gathered by a viner, the peas are podded by a "huller," and are assorted in four or five sizes by a revolving cylinder, the sides of which have meshes of varying sizes. After being blanched the peas are covered with brine, placed in tins, and sealed by machine. They are then processed once in a retort for twenty minutes at a temperature of 240° F. One firm in Wisconsin, U.S.A., puts up over 2,500,000 tins of peas annually. As a general rule fruits and vegetables are only processed once, meats and fish twice. Method and results vary greatly. Until recently there has not been any considerable scientific study of the art, and canners are generally deficient in a knowledge of scientific cooking and of the time and heat required to destroy the various kinds of bacteria.

The cans are made from steel plates, with little or no solder anywhere exposed to chemical action. In a perfectly closed tin chemical action is virtually suspended. Upon the access of air the acids in fruits and vegetables may decompose the tin very rapidly, forming mineral salts, and therefore the contents of a tin should be immediately removed. When properly prepared canned food will keep without deterioration for practically an unlimited period of years in all extremes of any climate. At the London Exhibitions of 1851, 1862, and 1873 tins of meat which had been put up from twenty-five to forty years were found perfectly sound. Stores of meat, &c., in tins have been left in the Arctic regions for years, annually exposed to temperatures of 92° below and 80° above zero, and when examined found as sound as the day they were put up. Condensed milk thirty-two years old was found in perfect condition except for a slight discoloration. It is attested on high medical authority that the qualities and properties of foods are not altered to any material extent by the process of preservation. Severe tests of this statement have been made both in the Arctic regions and in the torrid zone. Brigadier-General A. W. Greeley, U.S.A., records that canned fruits and vegetables which were subjected to the extremes of Arctic temperatures for almost three years presented the same appearance

as though freshly canned, and their flavour was as good when the last can was eaten as in the first month. No illness of any kind occurred prior to the famous retreat, and those most inclined to canned fruit and vegetables were the healthiest and strongest of the party. Surgeon-Major W. Simson Pratt, M.D., whose experience and judgment on this point were attested by Sir Garnet (afterwards Lord) Wolseley, reported as follows:—"Taking my experience in India and the late Nile expedition in which the test of tinned provisions was exceptionally severe from continued exposure to the powerful direct rays of the sun, I have found that tinned provisions, meat, and vegetables, put up separately or combined in the form of soups, are practically undamageable by any climatic heat."

Canning was early introduced in various parts of the Atlantic States of North America (1820-45). In 1848 the demand for canned meat for California became urgent, and additional impetus was given by the Civil War in America, 1861-65. From that time the industry spread over the globe. There are now canning factories in China, the East Indies, Africa, France, Great Britain, and other countries of Europe; but the industry has received its chief development in the United States and Canada. Factories line the Atlantic coast from Nova Scotia to Florida, the Gulf of Mexico, the Pacific coast as far north as points between 60° and 65° north latitude in Alaska, and are found in nearly all the forty-six States of the Union. In the whole of North America there are about 2000 canning factories besides a number of firms in the cattle trade that have canning houses in connexion with their stock-yards. One of these has placed upon the market eighty food specialties into which meat or poultry enter, and is adding one new sort every week. Besides the packing of all varieties of fruits, vegetables, meats, fish, fowl, soups, the packers put up combinations of food, and the favourite special dishes of different nations, as for instance, succotash, okra and tomatoes, stewed kidneys, clam chowder, plum pudding, Irish stew, beefsteak and onions, Hamburger steak with onions, veal loaf, ham loaf. Many of these articles are sold as low as eighty to ninety cents per dozen (3s. 2½d. to 3s. 7½d.), so as to permit of their being sold to consumers at ten cents (5d.) per tin. Full statistics are not available because packers are unwilling to make public the extent of their business, but the following figures may be relied on. In 1889 there were put up in the United States and Canada 177,718,152 No. 3 or quart tins of tomatoes, and during ten years 1891-1900, a total of 1,174,369,200 tins. Of sweet corn there were put up in 1900 a total of 155,654,976 tins, and during ten years 937,452,408 tins. In California the estimated output of table fruits reaches sixty million tins every season. The output of canned salmon on the Pacific coast for ten years 1890-1899, was 1,027,510,896 one-pound tins. During the three seasons ending 1899, the average annual output was nearly 3,000,000 cases of forty-eight one-pound tins each, or 144,000,000 tins. Of this the United Kingdom takes an average of over 48,000,000 tins annually. The magnitude of the American industry is further shown by the fact that during the year ending 30th June 1900 the exports of canned beef were 55,553,745 pounds, of which 32,273,374 pounds went to the United Kingdom, and 12,172,889 pounds to South Africa. It is estimated that 375,000,000 pounds of milk are annually used in the United States for making condensed milk, which is equivalent to an output of 156,500,000 tins. One company engaged in the business has a capital of \$20,000,000. Large corporations are engaged in the same line in Switzerland and other countries. It is safe to estimate the output of canned goods in the United States and Canada at over one billion

tins annually, exclusive of jams and preserves put up in tin cans.

The price of canned goods has fallen enormously, the difference being almost wholly due to machinery. The machinery for canning peas promises to stimulate the industry for years to come, and the portable process kettle has multiplied the producers of tomatoes many times over. So great has been the increase of production that the normal relation of supply to demand has been disturbed for years, and in the case of some articles is not yet adjusted to a profitable basis. The following are the comparative prices of vegetables per dozen one-pound cans:—

	1870.	1900.
Corn . . .	11/ to 12/ \$2.75 to 3.00	2/5 to 3/ \$.60 to .75
Peas . . .	11/ to 15/ 2.75 to 3.75	3/5 to 4/10 .85 to 1.20
Tomatoes . .	10/ ... 2.50	2/10 to 3/5 .70 to .85
Lima beans . .	13/ ... 3.25	3/ to 3/5 .75 to .85
String beans .	9/ ... 2.25	2/ to 2/10 .50 to .70
Asparagus .	£1, 4/ ... 6.00	13/ ... 3.25

In meat products the price per dozen cans has fallen off as follows:—

	1849.	1900.
2-lb meats .	£1, 1/ \$5.25	10/10 \$2.70
2-lb poultry .	1, 10/ 7.50	12/7½ 3.15
2-lb oysters .	1, 10/ 7.50	3/5 .85
2-lb clams .	1, 8/ 7.00	9/7½ 2.40
1-lb lobster .	12/ 3.00	12/ 3.00
1-lb salmon .	14/6 3.62	7/5 1.85

(F. N. B.)

Cannock, a market town and railway station in the Western parliamentary division of Staffordshire, England, in the district known as Cannock Chase, 9 miles S.S.E. of Stafford. There are ancient and modern Anglican churches; a Roman Catholic school-chapel, and various Nonconformist chapels; two endowed schools; public rooms, market-hall, urban council offices, and a public hall. The Cannock Chase district abounds in coal mines and also contains iron. Area of township (an urban district), 8010 acres; population (1881), 17,125; (1901), 23,500. There is a parish of Cannock.

Canons of Hippolytus, The.—This book stands at the head of a series of Church Orders, which contain instructions in regard to the choice and ordination of Christian ministers, regulations as to widows and virgins, conditions of reception of converts from heathenism, preparation for and administration of baptism, rules for the celebration of the eucharist, for fasting, daily prayers, charity suppers, memorial meals, first-fruits, &c. We shall give (1) a description of the book as we have it at present; (2) a brief statement of its relation to allied documents; (3) some remarks on the evidence for its date and authorship.

1. We possess the *Canons of Hippolytus* only in an Arabic version, itself made from a Coptic version of the original Greek. Attention was called to the book by Wansleben and Ludolf towards the end of the 17th century, but it was only in 1870 that it was edited by Haneberg, who added a Latin translation, and so made it generally accessible. In 1891 Achelis reproduced this translation in a revised form, embodying it in a synopsis of allied documents. He suspected much interpolation and derangement of order, and consequently rearranged its contents with a free hand. In 1900 a German translation was made by Riedel, based on fresh MSS. These showed that the book, as hitherto edited, had been thrown into disorder by the displacement of two pages near the

end; they also removed other difficulties upon which the theory of interpolation had been based. Further discoveries, to be spoken of presently, have added to our materials for the study of the book, and a fresh investigation of it is urgently needed.

The book is attributed to "Hippolytus, the chief of the bishops of Rome," and is divided into thirty-eight canons, to which short headings are prefixed. This division is certainly not original, but it is convenient for purposes of reference. Canon 1 is prefatory; it contains a brief confession of faith in the Trinity, and especially in the Word, the Son of God; and it speaks of the expulsion of heretics from the Church. Canons 2-5 give regulations for the selection and ordination of bishops, presbyters, and deacons. The bishop is chosen by the whole congregation: "one of the bishops and presbyters" is to lay hands upon him and say a prayer which follows (3): he is at once to proceed with "the offering," taking up the eucharistic service at the point where the *sursum corda* comes in. A presbyter (4) is to be ordained with the same prayer as a bishop, "with the exception of the word bishop"; but he is given no power of ordination (this appears to be inconsistent with c. 2). The duties of a deacon are described, and the prayer of his ordination follows (5). Canons 6-9 deal with various classes in the Church. One who has suffered punishment for the faith (6) is to be counted a presbyter without ordination: "his confession is his ordination." Readers and sub-deacons (7) are given the Gospel, but are not ordained by laying-on of hands. A claim to ordination on the ground of gifts of healing (8) is to be admitted, if the facts are clear and the healing is from God. Widows are not ordained (9): "ordination is for men only." Canons 10-15 describe conditions for the admission of converts. Certain occupations are incompatible with Christian life: only under compulsion may a Christian be a soldier. Canons 16-18 deal chiefly with regulations concerning women. Canon 19 is a long one dealing with catechumens, preparation for baptism, administration of that sacrament, and of the eucharist for the newly-baptized. The candidate is twice anointed: first, with the oil of exorcism, after he has said, with his face westward, "I renounce thee, O devil, and all thy following"; and, again, immediately after the baptism. As he stands in the water, he declares his faith in response to an interrogatory creed; and after each of the three clauses he is immersed. After the second anointing the bishop gives thanks "for that Thou hast made them worthy that they should be born again, and hast poured out Thy Holy Ghost upon them, so that they may belong, each one of them, to the body of the Church": he signs them with the cross on their foreheads, and kisses them. The eucharist then proceeds: "the bishop gives them of the body of Christ and says, This is the body of Christ, and they answer Amen"; and similarly for the cup. Milk and honey are then given to them as being "born a second time as little children." A warning is added against eating anything before communicating. Canons 20-22 deal with fast-days, daily services in church, and the fast of the passover-week. Canon 23 seems as if it closed the series, speaking, as it does, of "our brethren the bishops" who in their cities have made regulations "according to the commands of our fathers the apostles": "let none of our successors alter them; because it saith that the teaching is greater than the sea, and hath no end." We pass on, however, to regulations about the sick (24) who are to be visited by the bishop, "because it is a great thing for the sick that the high-priest should visit them (for the shadow of Peter healed the sick)." Canons 25-27 deal again with prayers and church-services. The "seven hours" are specified, with reasons for their observance (25): attendance at sermons is urged (26), "for the Lord is in the place where his lordship is proclaimed" (comp. *Didaché* 4, part of the *Two Ways*). When there are no prayers in church, reading at home is enjoined (27): "let the sun each morning see the book upon thy knees" (comp. *Ath. ad virg.*, § 12, "Let the sun when he riseth see the book in thy hands"). Prayer must be preceded by the washing of the hands. "No believer must take food before communicating, especially on fast-days": only believers may communicate (28). The sacred elements must be guarded, "lest anything fall into the cup, and it be a sin unto death for the presbyters." No crumb must be dropped, "lest an evil spirit get possession of it." Canons 30-35 contain various rules, and specially deal with suppers for the poor (*i.e.*, *agapae*) and memorial feasts. Then we have a prayer for the offering of first-fruits (36); a direction that ministers shall wear fair garments at "the mysteries" (37); and a command to watch during the night of the resurrection (38). The last canon hereupon passes into a general exhortation to right living, which forms a sixth part of the whole book. In Riedel's translation we read this for the first time as a connected whole. It falls into two parts, and describes, first, the true life of ordinary Christians, warning them against an empty profession, and laying down many precepts of morality; and then it addresses itself to the "ascete" who "wishes to belong to the rank of the angels," and who lives a life of solitude and poverty. He is

encouraged by an exposition, on somewhat strange lines, of the temptations of our Lord, and is specially warned against spiritual pride and contempt of other men. The book closes with an appeal for love and mutual service, based on the parables in St Matthew xxv.

2. It is impossible to estimate the position of the Canons of Hippolytus without some reference to allied documents. (a) The most important of these is what is now commonly called the *Egyptian Church Order*. This is preserved to us in Coptic and Æthiopic versions, of which Achelis, in his synopsis, gives German translations. The subject-matter and arrangement of these canons correspond generally to those of Hippolytus; but many of the details are modified to bring them into accord with a later practice. A new light has been thrown on the criticism of this work by Hauler's discovery (1900) of a Latin version (of which, unfortunately, about half is missing) in the Verona palimpsest, from which he has also given us large Latin fragments of the *Didascalia* (which underlies books i.-vi. of the Apostolic Constitutions, and which hitherto we have only known from the Syriac). The Latin of the Egyptian Church Order is somewhat more primitive than the Coptic, and approaches more nearly, at some points, to the *Canons of Hippolytus*. It has a preface which refers to a treatise *Concerning Spiritual Gifts*, as having immediately preceded it; but neither this nor the Coptic-Æthiopic form has either the introduction or concluding exhortation which is found in the Canons of Hippolytus. (b) The *Testament of the Lord* is a document in Syriac, of which the opening part had been published by Lagarde, and of which Rahmani (1899) has given us the whole. It professes to contain instructions given by our Lord to the apostles after the resurrection. After an introduction containing apocalyptic matter, it passes on to give elaborate directions for the ordering of the Church, embodying, in a much-expanded form, the Egyptian Church Order, and showing a knowledge of the preface to that document which appears in the Latin version. It cannot be placed with probability earlier than the latter part of the 4th century. (c) The *Apostolic Constitutions* is a composite document, which probably belongs to the end of the 4th century. Its first six books are an expanded edition of a *Didascalia* which we have already mentioned: its seventh book similarly expands and modifies the *Didaché*: its eighth book begins by treating of "spiritual gifts," and then in c. 3 passes on to expand in like manner the Egyptian Church Order. The hand which has wrought up all these documents has been shown to be that of the interpolator of the Ignatian Epistles in the longer Greek recension. (d) The *Canons of Basil* is the title of an Arabic work, of which a German translation has been given us by Riedel, who thinks that they have come through Coptic from an original Greek book. They embody, in a modified form, considerable portions of the Canons of Hippolytus.

3. We now approach the difficult questions of date and authorship. Much of the material has been quite recently brought to light, and criticism has not had time to investigate and pronounce upon it. Some provisional remarks, therefore, are all that can prudently be made. It is plain that we have two lines of tradition: (1) The Canons of Hippolytus, followed by the Canons of Basil; (2) the Egyptian Church Order, itself represented (a) by the Latin version, the Testament of the Lord, and the Apostolic Constitutions, which are linked together by the same preface (or portions of it), (b) by the Coptic and Æthiopic versions. Now, the Latin preface points to a time when the canons were embodied in a *corpus* of similar materials, or, at the least, were preceded by a work on "Spiritual Gifts." The Canons of Hippolytus have a wholly different

preface, and also a long exhortation at the close. The question which criticism must endeavour to answer is, whether the Canons of Hippolytus are the original from which the Egyptian Church Order is derived, or whether an earlier body of canons lies behind them both. At present it is probably wise to assume that the latter is the true explanation. For the Canons of Hippolytus appear to contain contradictory regulations (e.g., cc. 2 and 4 of the presbyters), and also suggest that they have received a considerable supplement (after c. 23). There is, however, no doubt that they present us with a more primitive stage of Church life than we find in the Egyptian Church Order. The mention of sub-deacons (which, after Riedel's fresh manuscript evidence, cannot now be dismissed as due to interpolation) makes it difficult to assign a date much earlier than the middle of the 3rd century.

The Puritan severity of the canons well accords with the temper of the writer to whom the Arabic title attributes them; and it is to be noted that the exhortation at the close contains a quotation from 2 Peter actually attributed to the apostle, and Hippolytus is perhaps the earliest author who can with certainty be said to have used this epistle. But the general style of Hippolytus, which is simple, straightforward, and strong, is in marked contrast with that of the closing passage of the canons; moreover, his mind, as presented to us in his extant writings, appears to be a much larger one than that of the writer of these canons; it is as difficult to think of Hippolytus as it would be to think of Origen in such a connexion. How, then, are we to account for the attribution? There is evidence to show that Hippolytus was highly revered throughout the East: his writings which were in Greek were known, but his history was entirely unknown. He was supposed to be "a pupil (γνῶριμος) of apostles" (Palladius, 4th century), and the Arabic title calls him "chief of the bishops of Rome," i.e., archbishop of Rome. It is hard to trust this attribution more than the attribution of a Coptic discourse on the *Dormitio Mariae* to "Evodius, archbishop of the great city Rome, who was the second after Peter the apostle" (*Texts and Studies*, iv. 2-44)—Evodius being by tradition first bishop of Antioch. A whole group of books on Church Order bears the name of Clement of Rome; and the attribution of our canons to Hippolytus may be only an example of the same tendency. The fact that Hippolytus wrote a treatise *Concerning Spiritual Gifts*, and that some such treatise is not only referred to in the Latin preface to the Egyptian Church Order, but is actually found at the beginning of book viii. of the Apostolic Constitutions, introduces an interesting complication; but we cannot here pursue the matter further. Dom Morin's ingenious attribution of the canons to Dionysius of Alexandria (on the ground of Eusebius, *H.E.* vi. 46-5) cannot be accepted in view of the broader church policy which that writer represents. If the Hippolytean authorship be given up, it is probable that Egypt will make the strongest claim to be the locality in which the canons were compiled in their present form.

The authorities of chief practical importance are ACHELIS, *Texte u. Unters.*, vi. 4 (1891); RAHMANI, *Testamentum Domini* (1899); HAULER, *Didascalia Apostolorum* (1900); RIEDEL, *Kirchenrechtsquellen des Patriarchats Alexandrien* (1900). (J. A. R.)

Canovas del Castillo, Antonio (1828-1897), Spanish statesman, was born in Malaga 8th February 1828. Educated in his native town, he went to Madrid in 1845, bent upon finding means to complete his literary and philosophical studies. His uncle Don Serafin Estebañez Calderon, found him a situation as clerk in the Madrid-Aranjuez railway, but Canovas soon took to journalism and literature, earning enough to support him-

self and pay for his law studies at the Madrid University. During this period he published his two best works—a historical novel, *Las Campanas de Huesca*, and the history of the decay of Spain from Philip III. to Charles II. under the house of Austria. He became a politician through his Junius-like letters to the "Murciélago"—*The Bat*, a satirical political journal—and by drawing up the manifesto of Manzanares in 1854 for Marshal O'Donnell, of whom he always remained a loyal adherent. Canovas entered the Cortes in 1854; he was made governor of Cadiz in 1857, sub-director of the state department in 1858, under-secretary at the Home Office in 1860, minister of the interior in 1864, minister of the colonies in 1865, minister of finance in 1866, and was exiled by Marshal Narvaez in the same year, afterwards becoming a bitter opponent of all the reactionary cabinets until the revolution of 1868. He took no part in preparing that event. He sat in the Cortes Constituyentes of 1869 as a doctrinaire Conservative, combating all Radical and democratic reforms, and defending the exiled Bourbons; but he abstained from voting when the Cortes elected Amadeus king on 16th November 1870. He did not object to some of his political friends, like Silvela and Elduayen, entering the cabinets of King Amadeus, and in 1872 declared that his attitude would depend on the concessions which Government would make to Conservative principles. After the abdication of Amadeus and the proclamation of the federal republic, Canovas took the lead of the propaganda in favour of the restoration of the Bourbons, and was their principal agent and adviser. He drew up the manifesto issued in 1874 by the young King Alphonso XII., at that time a cadet at Sandhurst; but he dissented from the military men who were actively conspiring to organize an Alphonsoist *pronunciamento*. Like Marshal Concha, marquis del Duero, he would have preferred to let events develop enough to allow of the dynasty being restored without force of arms, and he severely blamed the conduct of the generals when he first heard of the *pronunciamento* of Marshal Campos at Sagunto. Sagasta thereupon caused Canovas to be arrested (30th December 1874); but the next day the Madrid garrison also proclaimed Alphonso XII. king, and Canovas showed the full powers he had received from the king to assume the direction of affairs. He formed a regency ministry pending the arrival of his majesty, who confirmed his appointment, and for six years Canovas was premier except during the short-lived cabinets of Marshal Jovellar in 1875 and Marshal Campos for a few months in 1879. Canovas was, in fact, the soul of the Restoration. He had to reconstruct a Conservative party out of the least reactionary parties of the days of Queen Isabella and out of the more moderate elements of the revolution. With such followers he made the constitution of 1876 and all the laws of the monarchy, putting a limited franchise in the place of universal suffrage, curtailing liberty of conscience, rights of association and of meeting, liberty of the press, checking democracy, obliging the military to abstain from politics, conciliating the Carlists and Catholics by his advances to the Vatican, the Church, and the religious orders, pandering to the protectionists by his tariff policy, and courting abroad the friendship of Germany and Austria after contributing to the marriage of his king to an Austrian princess. Canovas crowned his policy by countenancing the formation of a Liberal party under Sagasta, flanked by Marshal Serrano and other Liberal generals, which took office in 1881. He again became premier in 1883, and remained in office until November 1885; but he grew very unpopular, and nearly endangered the monarchy in 1885 by his violent repression of popular and Press demonstrations, and of student riots in Madrid and the provinces.

At the death of Alphonso XII. he at once advised the queen regent to send for Sagasta and the Liberals, and during five years he looked on quietly whilst Sagasta re-established universal suffrage and most of the liberties curtailed in 1876, and carried out a policy of free trade on moderate lines. In 1890 Canovas took office under the queen regent, and one of his first acts was to reverse the tariff policy of the Liberals, denouncing all the treaties of commerce, and passing in 1892 a highly protectionist tariff. This was the starting-point of the decline in foreign trade, the advance of foreign exchanges, the decay of railway traffic, and the monetary and financial crisis which continued from 1892 to 1898. Splits in the Conservative ranks forced Canovas to resign at the end of 1893, and Sagasta came in for eighteen months. Canovas resumed office in March 1895 immediately after the outbreak of the Cuban insurrection, and devoted most of his time and efforts, with characteristic determination, to the preparation of ways and means for sending 200,000 men to the West Indies to carry out his stern and unflinching policy of no surrender, no concessions, and no reforms. He was making up his mind for another effort to enable General Weyler to enforce the reforms that had been wrung from the Madrid Government, more by American diplomacy than from a sense of the inevitable, when the bullet of an anarchist, in August 1897, at the baths of Santa Agueda, cut short his career. On the whole, Canovas must be regarded as the greatest Spanish statesman of the close of the 19th century. He was not only a politician but also a man of the world, a writer of considerable merit, a scholar well versed in social, economical, and philosophical questions, a great debater, a clever lecturer, a member of all the Madrid academies, and a patron of art and letters. (A. E. H.)

Canrobert, François Certain (1809-1895), Marshal and Senator of France, was born at St Céré, Lot, on 27th June 1809, and educated at St Cyr; he received a commission as sub-lieutenant in the 47th Regiment in 1828. He went to Africa in 1835, served in the expedition to Mascara, at the capture of Tlemcen, and in 1837 was wounded in the storm of Constantine (captain and Legion of Honour). Promoted lieutenant-colonel in 1846 and colonel of the 3rd Regiment in 1847, he commanded the expedition against Ahmed Sghir in 1848, and defeated the Arabs at the Djerma Pass. Transferred to the Zouaves, he defeated the Kabyles, and, in 1849, displayed both courage and energy in reinforcing the blockaded garrison of Bou Sada, and in commanding one of the attacking columns at Zaatcha (general of brigade and Commander Legion of Honour). He led the expedition against Narah in 1850 and destroyed the Arab stronghold. Summoned to Paris, he was made aide-de-camp to the President, Louis Napoleon, and took part in the *coup d'état* of 2nd December 1851. In the Crimean war he commanded the 1st Division at the battle of the Alma, where he was twice wounded. He succeeded St Arnaud a few days later in the supreme command of the French army. He was slightly wounded and had a horse killed under him at Inkerman when leading a charge of Zouaves. In May 1855 he resigned the command-in-chief, and, soon after his return to France, was sent on diplomatic missions to Denmark and Sweden (Marshal and Senator of France, Grand Cross Legion of Honour, and honorary G.C.B.). He commanded the 3rd army corps in Lombardy in 1859, distinguishing himself at Magenta and Solferino. He successively commanded the camp at Châlons, the 4th army corps at Lyons, and the army of Paris. In the Franco-German war he commanded the 6th army corps, and, after the disaster at Forbach, served under Bazaine

in the battles around Metz, and became a prisoner of war on the surrender of that fortress. In 1872 he was appointed a member of the Supreme Council of War. He was elected Senator for Lot in 1876, and for Charente in 1879, and again in 1885. He died at Paris on 28th January 1895, and his remains received a public funeral. (R. H. V.)

Canstatt, or CANNSTATT, a town and watering-place of Württemberg, on the Neckar, 2½ miles by rail N.E. from Stuttgart. It was connected in 1891-93 with Berg, a suburb of Stuttgart, by a bridge 990 feet long. It has railway workshops, iron-foundries, and machine shops, and manufactures of fire-engines, zinc goods, electro-technical apparatus, motor-cars, cottons, &c.; fruit and wine are cultivated. The poet Freiligrath was buried here. Population (1885), 18,031; (1895), 22,590; (1900), 26,449.

Cantal, a department in the middle of the central plateau of France, watered by the tributaries of the Lot, the Dordogne, and the Allier.

Area, 2230 square miles, distributed among 23 cantons and 267 communes. From 241,742 in 1886 the population declined to 218,941 in 1901. In 1899 there were 4978 births, of which 277 were illegitimate, against 4644 deaths; marriages numbered 1672. The chief towns are Aurillac (the capital), Mauriac, Murat, St Flour, and Salers. In 1896 there were 782 schools, with 41,000 pupils, and 3 per cent. of the population was illiterate. The area under cultivation in 1896 comprised 1,161,437 acres, of which 452,218 acres were laid out in grass, employed for the rearing of a great many cattle. Rye takes the first rank among the cereals, yielding in 1899 a value of £400,000. The green crop lands yield only a minimal return, but the natural grass lands, in which Cantal ranks first among the French departments, produced in 1899 a value of £1,025,000. There is abundance of chestnuts. The live stock in 1899 included 222,790 cattle, 42,220 pigs, 369,000 sheep, and 15,500 goats. The mining comprises but a few coal-pits, turning out 99,000 metric tons in 1898, and except for the copper-smith work of St Flour there is no metallurgic industry to speak of.

Canterbury, a city, county borough, and parliamentary borough—since 1885 returning one member only—of England, on the Stour, 62 miles E.S.E. of London by rail. The Elham Valley railway now connects Canterbury with Folkestone. Parish churches, other than the cathedral, number fourteen. Recent erections are the Simon Langton schools, endowed with funds of an old Blue Coat school, the Sidney Cooper Art Gallery, an institute containing library and museum, a Masonic temple, and a memorial (1891) of Christopher Marlowe, who was born here; there are also a Wesleyan college, the Clergy Orphan School, and a school of art under the town council. Linen-weaving, rope-making, and tanning are among the industries. Area of county borough, 3971 acres; population (1881), 21,848; (1901), 24,868.

Many improvements have been made in the cathedral. The crypt, probably the finest in England, has been cleared of the lumber formerly deposited in it; the earth placed there in the 16th century, on account of the inflow of water, has all been removed, and the bases of the Norman columns exposed to view; a good floor has been laid down, and the whole crypt provided with gas brackets, so that it can be used for various purposes. The chapel of the Holy Innocents has been fitted up and is occasionally used as a place of worship. The French church, which for many years occupied a large portion of the south side of the crypt, has been removed to the Black Prince's chantry, and is now far more convenient for the use of the alien congregation. A judicious use of gold ornament and an elaborate reredos have added materially to the beauty of the cathedral. The chapel of St Anselm has also been restored, and is now used for early morning service as

well as for other services. The chapter-house, formerly in a ruinous condition, has been thoroughly restored. The roof has been entirely renovated, and the ceiling again appears in all its original beauty. The windows have all been reglazed, and the east window filled with stained glass at a cost of £1000, contributed by the Freemasons of England. The interior of the walls has been redecorated, and the arcade, which extends round the whole building, has been tastefully ornamented. The old pavement has been replaced by a new one of a uniform pattern, and arrangements for warming this splendid room and making it suitable for public meetings have been completed.

The old palace, at the north-western part of the cathedral, last occupied by Archbishop Parker, who there entertained Queen Elizabeth, of which only a part remained, has after many changes been rebuilt, and is now the country residence of the archbishop of Canterbury.

The field lying to the east of St Augustine's College, and known as the Abbey Field, has recently been acquired by trustees. In this field are the ruins of the Chapel of St Pancras, which was probably built by St Augustine. It also contains the eastern portion of the Abbey Church of St Peter and St Paul, in which St Augustine and many of his successors were buried. There are also remains of the chapter-house, dormitory, and infirmary, and the site of the chapel of the Blessed Virgin Mary built by Eadbald, Ethelbert's son and successor. The excavations which have been commenced have laid bare many matters of interest. The ruins of the chapel of St Pancras have been uncovered, and the abbey chapter-house has been traced in part. Of the abbey church the eastern apse is now exposed to view with its central and side apsidal chapels. The central chapel contains some interesting frescoes on the walls, and in the middle are the remains of an altar highly decorated. In the north apsidal chapel there is an altar almost perfect, in front of which were found the remains of an abbot, which had been enclosed in a wooden coffin. The ambulatory at the eastern end of the crypt has also been uncovered. To the east of the main church is an oblong chapel, in which was found the body of John Dygon, abbot, who died in 1509. On the head was a large leaden painted mitre, and in the grave were found a coffin plate, a leaden chalice and paten, and two finger rings. Exploration is in progress which will, it is hoped, yield much valuable information. (F. W. F.)

Canton, city and treaty port in southern China, capital of the province of Kwangtung, on the left bank of the river Canton, some 70 miles from its mouth. The city has continued to make good progress as one of the principal markets of China. The trade, which in 1874 was H. taels 26,139,000 (£7,841,000), amounted in 1899 to H. taels 58,641,000 (£8,769,000). The silver valuation represents more accurately the volume of trade. Besides the above, which comprises the trade carried in foreign bottoms, there is a large traffic in native craft of which no statistics are kept. There is daily communication by steamer with Hongkong, and with the Portuguese colony of Macao which lies near the mouth of the river. Inland communication by steam is now open by the West river route to the cities of Wuchow and Nanning. The opening of these inland towns to foreign trade, which has been effected, cannot but add considerably to the volume of Canton traffic. The native population is variously estimated at from 1,500,000 to 2,000,000, the former being probably nearer the truth. The foreign residents number about 400. Canton is the headquarters of the provincial government of Kwangtung and Kwangsi, generally termed the two Kwang, at the head of which is a governor-general or viceroy, an office which next to that of Nanking is the

most important in the empire. It possesses a mint built in 1889 by the then viceroy Chang Chih-tung, and equipped with a very complete plant supplied from England. It turns out silver subsidiary coinage and copper cash. Contracts have been entered into to connect Canton by railway with Hong-Kong (Kowloon), and by a grand trunk line with Hankow on the Yangtse. It is connected by telegraph with all parts.

Canton, a city of Fulton county, Illinois, U.S.A., on the Chicago, Burlington, and Quincy, and the Toledo, Peoria, and Western railways, at an altitude of 651 feet. It has extensive manufactures of agricultural implements. Population (1880), 3762; (1890), 5604; (1900), 6564 (424 foreign-born, and 38 negroes).

Canton, capital of Stark county, Ohio, U.S.A., situated in 40° 48' N. lat. and 81° 23' W. long., in the eastern part of the state, at an altitude of 1031 feet. It is at the intersection of three railways, the Pennsylvania, the Cleveland Terminal and Valley, and the Wheeling and Lake Erie. The surrounding country is a rich agricultural

region. In 1890 the manufacturing capital was \$5,621,960, and the output was valued at \$7,986,627. Of this, about one-fifth consisted of agricultural implements. In 1900 the assessed valuation of real and personal property was \$11,033,380; the net debt was \$924,719, and the total tax rate \$30 per \$1000. Population (1880), 12,258; (1890), 26,189; (1900), 30,667 (4018 foreign-born and 135 negroes). Canton was the home of President McKinley.

Cantù, a town of the province of Como, Lombardy, Italy, 8 miles by rail S. by E. from Como. It is a seat of considerable industry, chiefly carried on in the inhabitants' own houses. Silks, laces, veils, and nails are the principal articles made. There are also furniture factories and a technical school. Population, about 5500.

Capannori, a town of the province of Lucca, Tuscany, Italy, 3 miles E. from Lucca. It carries on silk, thread, and paper industries. Population, about 44,000.

CAPE COLONY.

GEOGRAPHY AND STATISTICS.

CAPE COLONY, or officially, **THE COLONY OF THE CAPE OF GOOD HOPE**, is a British colony in the extreme south of Africa. During the last twenty-five years of the 19th century, the boundaries of the colony underwent many modifications. In 1876, though various parts of independent Kaffraria¹ had already been brought under the control of the Cape Government, no part of the territories now known as Transkei, Tembuland, Griqualand East, and Pondoland had been actually incorporated in the colony. It was not, indeed, till 1879 that two large areas of Transkei, Fingoland and the Idutywa reserve, together with the district commonly known as Noman's-land, which was taken to comprise most of the territory belonging to modern Griqualand East, were formally proclaimed an integral part of the Cape. About this time most of the rest of Kaffraria came under British control, but it was 1885 before Galekaland, the coast region of Transkei, and the various districts composing Tembuland—Bomvanaland on the coast, Tembuland Proper, and Emigrant Tembuland, were annexed to the colony. By this annexation, the frontier of the colony was carried right up to the Umtata river, beyond which it has been already stated that Griqualand East, stretching to Natal, was within the frontier line, so that by 1885 only Pondoland, fronting on the Indian Ocean, separated the Cape from Natal. In Pondoland, Port St John's, after being for some years connected with the colony, had been incorporated along with the lower reaches of the St John's river in 1884; in 1886 the Xesibe Country (Mount Ayliff) was annexed to the Cape, and added to Griqualand East; and in the following year the Rhode Valley was included within the boundary line. The rest of Pondoland, chiefly in virtue of a British protectorate established over all the coast region in 1885, was already more or less under British control, and in 1894 it was annexed to the Cape in its entirety. Thus by 1894 the whole of Kaffraria had been incorporated, and in 1901 the extreme north-eastern frontier of the Cape was coterminous all along the line with that of Natal. Looking to the west of Kaffraria, Basutoland, which became part of Cape Colony in 1871, has since

1884 been constituted a Crown colony. Farther west still, the intimate connexion between Cape Colony and Griqualand West resulted in the incorporation of the latter in 1880, and fifteen years later the adjacent Crown colony of British Bechuanaland, lying between the Orange and Molopo rivers, and extending west as far as the 20th meridian, was brought within the Cape boundaries. On the other hand, Great Namaqualand, stretching west to the Atlantic, has been taken over by Germany, with the exception of a small district around Walfisch Bay, which, proclaimed British territory in 1878, was incorporated in 1884.

Area and Population.—The following table shows concisely the growth of the colony, giving the extent and population of the actual colony in 1875; in 1891, when Transkei, Tembuland, Griqualand East, Griqualand West, and Walfisch Bay had been incorporated, and Basutoland had been disannexed; and in 1900, when Pondoland and British Bechuanaland had been added.

1875.		1891.		1900.	
Area.	Population.	Area.	Population.	Area.	Pop. (estimated).
201,136	849,160	260,918	1,598,778	277,077	2,349,908

The census of 1891 was the only one taken between 1875 and 1901. Since 1875 the limits of most of the divisions of the colony have been altered so entirely that it is impossible to make any comparison between the population returns of 1901 and those of 1891 and 1875. With regard to the 1875 census, however, it should be noted that the revised returns differed slightly from those given in the ninth edition of this work, placing the population of the colony proper at 720,984, and that of Basutoland at 128,176, thus making the total for the whole colony 849,160, as given above.

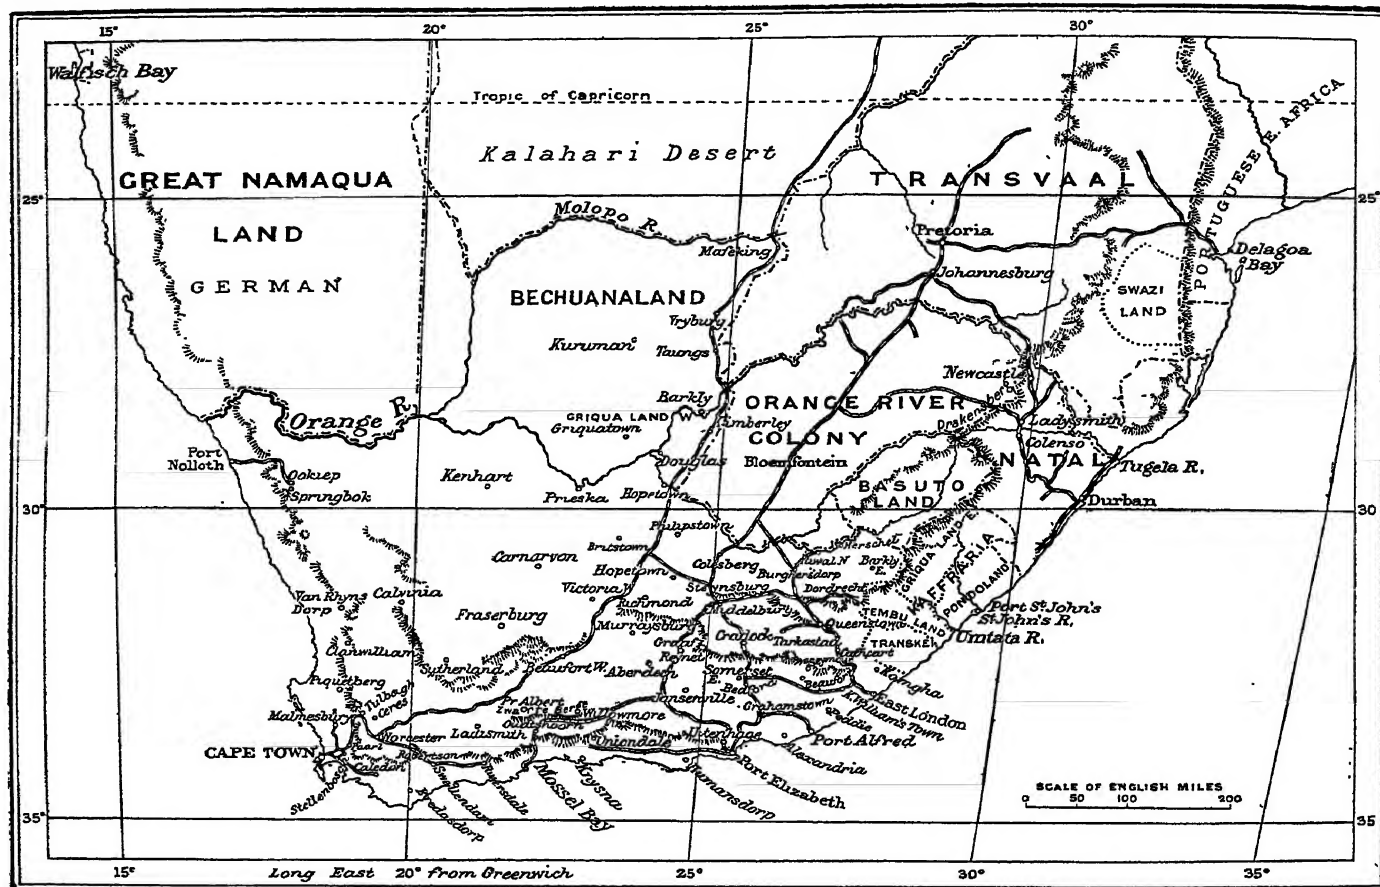

The incorporation of the various native territories in the east has considerably increased the average density of population in the colony. Thus, in 1891 the average density of population within the old limits of the colony (but excluding Basutoland) was 5.00 per square mile; that of Griqualand West was only 5.49 per square mile, while that of Walfisch Bay was merely 1.79; but the density of Griqualand East being 20.10, that of Tembuland 43.77, and that of Transkei 60.16, the density of the whole colony in 1891 was brought up to 6.90. If Pondoland (46.53 per square mile) and British Bechuanaland (1.41 per square mile) be taken into account, it is found that the density of the colony, as at present constituted, was 6.45 in 1891. Of the 1,527,224 inhabitants within the limits of the colony in 1891, 876,987, or about a quarter, were European or white (some 280,000 of Dutch and

¹ Though not officially recognized, we shall retain the term Kaffraria, which is convenient for designation.

French descent; 130,000 of British descent); 13,907 were Malay, 50,388 Hottentot, 229,680 Fingo, 608,456 Kaffir or Bechuana, and 247,806 mixed and other. In 1900 it was roughly estimated that the colony, as then constituted, contained about half a million white and a million and a half coloured inhabitants. The professional, commercial, and industrial occupations employ a comparatively small proportion of the people. In 1891 those of the white population engaged in such pursuits numbered respectively only 14,253, 17,922, and 31,177, whereas 77,118 were engaged in domestic employment, and 74,095 in agricultural employment, while 155,338 were dependants, and the employment of 7089 was indefinite or unspecified. The natives follow the domestic and agricultural pursuits almost exclusively. The registration of births and deaths did not become compulsory till 1895. The

following table shows the numbers of the births, deaths, and marriages in that year, and in 1898 and 1899:—

Year.	Marriages.	Births.		Deaths.	
		Europeans.	Others.	Europeans.	Others.
1895	7360	14,763	31,432	6,660	24,919
1898	8718	15,340	37,864	6,936	34,031
1899	8525	15,214	39,258	6,758	30,477

MAP OF CAPE COLONY.

London: Stanford's Geog. Estab.

In 1900, 8736 marriages were solemnized, the number of births was 52,571, and the number of deaths 47,369. Among the European population the birth-rate is about 34·44 per thousand, and the death-rate 15·73 per thousand. In the same section of the population there were, in 1891, 181,031 females to 195,956 males, *i.e.*, 92·38 females to 100 males; in the total population the proportion was 99·03 to 100. About one-fifth of the population was urban, the chief towns being Cape Town, 51,251 (including suburbs, 83,718); Kimberley, 28,718; Port Elizabeth, 23,266; Grahamstown, 10,498; Beaconsfield, 10,478; Paarl, 7668; King William's Town, 7226; East London, 6924; Graaff Reinet, 5946; Worcester, 5404; and Uitenhage, 5331. From 1873-84 only 23,337 persons availed themselves of the Government aid to immigrants from England to the Cape, and in 1886 this aid was stopped. The total number of adult immigrants by sea, however, rapidly and steadily increased from 11,559 in 1891 to 38,669 in 1896, while during the same period the number of departures by sea only increased from 8415 to 17,695, and most of this increase took place in the last year. But from 1896 onwards the uncertainty of the political position caused a falling off in the number of immigrants, while the emigration figures still continued to grow; thus in 1900 there were 29,848 adult arrivals by sea, as compared with 21,163 departures.

Administration—Central Government.—Since 1893 the ministry under the Crown Governor consists of a Colonial Secretary, a Treasurer, an Attorney-General, a Commissioner of Public Works, and a Secretary of Agriculture. Each of these, if an elected member of either House of Parliament, may sit and speak in both,

but vote only in that of which he is a member. The office of Secretary for Native Affairs has been abolished, and its former duties have to be discharged by the Prime Minister or such other minister as they may be assigned to by the Governor. The Prime Minister may take whichever of the five offices named above he prefers. But if (like Mr Rhodes) he assumes none of them he may draw no salary, because no holder of any office of profit other than the five already named can be lawfully elected a member of Parliament. An unpaid prime minister may, however, sit and speak in both Houses, but vote only in that of which he is a member. Some of the Cabinets formed since 1881 have comprised a "minister without portfolio"; but the constitutional laws do not provide for, though they do not forbid, this. The Chief Justice is *ex-officio* President of the Legislative Council (which has 24 members), with a casting vote. Election is now for only seven years. The 46 electoral divisions, constituted in 1898, return 95 members to the Legislative Assembly or Lower House. Since 1882 the debates in each House may be conducted in either Dutch or English. The members of this House, who are still elected for five years, choose a Speaker from their own number. By Act No. 9 of 1892 vote by ballot for both Houses was introduced, and by the same Act the number of electors was restricted by various modifications in the requisite qualifications, with a view to preventing the white vote from being "swamped" by the black. The value of property, the occupation of which qualified for electorship, was raised from £25 to £75; an alternative to the being in receipt of wages to the amount of £50 per annum, namely, the being in receipt of £25 per annum with board and lodging,

was abolished; and, further, it was enacted that no one should in future be registered as an elector who could not sign his name and write his address and occupation. The total number of registered electors in 1898-99 was 109,888. The qualifications for a member of the Lower House, being the same as those for an elector, underwent the same modification as those for an elector; those which must be possessed by a member of the Upper House remain as they were. Cumulative voting is still allowed in the election of members for the Upper House, but not in the election of members for the Lower House. The members of both Houses are paid for their services during session. By Act No. 6 of 1899 the provisions of the general electoral law were temporarily set aside in the case of persons accused of treason during the Boer war. Such cases were dealt with by the Special Tribunals created for the purpose.

Local Government.—The colony is now divided into 79 fiscal divisions. The local affairs of each division are dealt with by a council elected every three years by the registered parliamentary voters, and presided over by a civil commissioner, who is usually also resident magistrate. The laws relating to municipalities, which now number 97, were consolidated and amended in 1882; each municipality is governed by a council (with a mayor at its head), a certain number of the members of which are elected by the ratepayers every year. In 1881 there were also constituted Village Management Boards of three members for the smaller villages and hamlets. These Boards are elected annually by the registered parliamentary voters, and are now 82 in number.

Justice and Crime: Pauperism.—The administration of justice is presided over by nine judges of the Supreme Court, who are divided into three Courts of three judges each. The first, called the Supreme Court, sits in Cape Town, and is presided over by the Chief Justice and two puisne judges; the second, known as the Eastern District Court, sits at Grahamstown, and is presided over by a Judge President and two puisne judges; and the third, known as the High Court of Griqualand, sits at Kimberley, and is also presided over by a Judge President and two puisne judges. From 1879 to 1886 there was a five-judges Court of Appeal for the colony, but in the latter year this Court was abolished, and its powers were vested in the Supreme Court. From this, whether sitting as a Court of Primary Instance or as a Court of Appeal (in which latter case there must not be less than three of the nine judges sitting), there is appeal only to the Privy Council. The judges of each of the three divisional Courts go on circuit twice a year, and since 1888 a special Court has been held at Kimberley for trying cases relating to illicit diamond buying ("I.D.B."). This Court consists of two judges of the Supreme Court and one other member, hitherto the civil commissioner or the resident magistrate of Kimberley. The Transkeian territories, which fall under the jurisdiction of the Eastern District Court, are subject to a Native Territories Penal Code, which came into force in 1887. Besides the usual magistrates in these territories, there are two chief magistrates, one for Griqualand East, and the other for Tembuland (officially including Pondoland) and Transkei. At the end of 1898 the Cape Police Force comprised 68 officers, 1922 men, and 1572 horses; the municipal and ordinary Police Force, 1401 men; and the Gaol Establishment, 689 men. There were 1233 persons convicted before the special Justices of the Peace Courts in 1899; 52,904 before Magistrates' Courts, and 804 before the Superior Courts; at the end of the year there were 3348 males and 352 females in gaol. In the colony proper, in 1898, 1410 persons received indoor relief, and an average of 638 monthly received outdoor relief.

Religion.—The following table classifies the inhabitants in 1891, according to religion:—

Denomination.	Whites.	All Races.	Per-centage.
Protestants—			
Dutch Reformed Church	228,627	306,320	20·06
Others	128,333	425,727	27·87
Total	356,960	732,047	47·93
Roman Catholics	14,853	17,275	1·13
Mahomedans	81	15,099	·99
Jews	3,007	3,009	·20
Various, including Un- known and Unspecified	1,606	5,970	·39
"No Religion"	530	753,824	49·36
Grand Total	376,987	1,527,224	100·00

The general description in the ninth edition of the relative strengths of the various Protestant bodies still holds good. The Methodists have a larger number of coloured people in their denomination than any other sect, but not a larger proportion.

Education.—The University of the Cape of Good Hope, modelled on that of London, was granted a royal charter in 1877, and is governed by a chancellor, a vice-chancellor (who is chairman of the University Council), and a council of 33 members, of whom 15 are elected by the University Convention, 15 nominated by the Cape Government, and 3 nominated by the Governor to represent Natal—these last under a recent Act granting representation on the council to any other South African colony or state that agreed to give a grant to the University funds. The examinations are open to candidates irrespective of where they have studied, but under the Higher Education Act grants are paid to seven colleges that specially devote themselves to preparing students for the graduation courses. These, at which there were 658 students in 1898-99, are the South African College at Cape Town, the Victoria College at Stellenbosch, the Diocesan College at Rondebosch, St Andrew's College at Grahamstown, Gill College at Somerset East, the School of Mines at Kimberley, and the Huguenot Ladies' College at Wellington. Several denominational colleges, receiving no Government aid, do the same work in a greater or less degree, the best known being St Aidan's (Roman Catholic) College and Kingswood (Wesleyan) College, both at Grahamstown. Graaff Reinet College, Dale College, King William's Town, and the Grey Institute, Port Elizabeth, occupy the place of high schools under the Education Department. The Theological Seminary at Stellenbosch prepares theological students for the ministry of the Dutch Church, and is not connected with University work—so long as the University does not grant degrees in Divinity. Primary education is under the Education Department, controlled by a Superintendent-General of Education. The schools under the Education Department are classified into undenominational public schools of three classes—mission schools, poor schools, district boarding-schools, private farm schools, evening schools, and aborigines' schools. In addition to these there are 3 art schools, 8 industrial schools for whites, 9 for aborigines, 5 training schools for whites, 11 for aborigines. Classes for adult teachers in drawing, needlework, and woodwork are held chiefly in Cape Town. In September 1899, just before the war broke out, there were in operation 2674 schools connected with the Education Department, taught by 4505 adult teachers, and having on their rolls 147,424 children, with an average attendance of 114,842. The total Government expenditure on education in 1899-1900 was £272,214. The standard of education is rapidly improving, but education is not compulsory, and it must be remembered that among the European population 28·82 per cent. of the males and 28·02 per cent. of the females could neither read nor write in 1891.

Finance.—The following table shows the revenue (including loans) and expenditure (including that under Loan Acts) of the colony in various financial years, from 1880 to 1900:—

Year ending 30th June.	Revenue.		Expendi- ture.
	Total.	Loans.	
1880	£3,556,601		£3,742,665
1885	£3,814,947	£496,795	4,211,832
1890	5,571,907	1,141,857	5,327,496
1897	7,389,966	...	6,360,404
1898	7,327,975	675,750	8,613,659
1899	8,781,212	2,317,434	8,190,124
1900	6,565,752	128,376	7,773,230

The principal items in the revenue and expenditure for 1900 were as follows:—

Revenue.	Expenditure.
Customs £1,879,408	Public debt £1,415,685
Stamps and Licenses 328,789	Railways 2,017,424
Postage 302,091	Defence 228,429
Railways 2,864,880	Police and gaols 564,395
Telegraphs 164,001	Civil establishment 191,347
	Science and education 278,071
	Crown lands, forests, irrigation, har- bours, &c. 244,554
	Post office and tele- graphs 495,498
	Native affairs 285,330

The estimated expenditure (under votes) for 1900-1 was put down at £6,888,852. The colony had a public debt of £31,097,825 on 31st December 1900, including £3,483,878 raised for corporate bodies, harbour boards, but guaranteed in the general revenue. Nearly the whole of the loans have been spent in public works—eighteen millions and a half sterling on railways alone. The total value of assessed property in the colony, excluding the Transkeian Territories, in 1900 was returned at £54,591,746, excluding Government property. The total revenue of the Divisional Councils in 1900 was £187,498, and expenditure £168,901. The total Municipal

revenue in 1900 was £942,317, and expenditure £922,992. The total debt of the Divisional Councils, 31st December 1900, was £36,440, and of the Municipalities £2,396,105.

Defence.—The whole of the Cape peninsula is fortified against foreign attack by a series of forts and batteries; here is situated the important naval station of Simon's Bay, which is to be greatly improved, new docks to cost three millions sterling having been already authorized. A contingent of the Imperial army is specially reserved for the defence of the peninsula, and the Imperial military expenditure in 1898 was £806,308; the naval expenditure amounted to about £200,000. Further, on the Cape and West African station generally, a squadron of 18 ships is maintained. In 1878 a law was passed whereby every able-bodied man between the age of 18 and 50 years is liable to be called upon for military service, but the only purely colonial force regularly maintained (other than some bodies of volunteers, numbering 6953 in 1898) is that known as the C.M.R.—Cape Mounted Rifles. This corps numbers about 1000 officers and men, whose ordinary duties are to preserve order in Transkei. The Cape Police may be called upon for defence purposes in case of emergency. The colonial expenditure on defence in 1899-1900 was £223,429.

Minerals and Mining.—A geological survey of the colony was commenced in 1896. Meanwhile great strides have been already made in developing the mineral resources of the colony. Diamonds have become by far the most valuable of all the products of the industry. The importance of the mines around Kimberley rose by leaps and bounds after their discovery about 1870, and how the output has increased and continues to be maintained will be seen from the figures given below under exports. Coal-mining is another industry that has greatly developed, chiefly owing to the encouragement that has been given to it by the extensive use of Cape coal on the Government railways. The total yield of the mines, which are mostly situated in the Stormbergen, was 198,451 tons in 1900. The demand for copper has given a big impetus to the mines in Namaqualand, the output from which was returned at 42,678 tons in 1900.

Agriculture.—There are no recent statistics as to the area under cultivation, but of the 177,376,660 acres comprising the total area of the colony as at present constituted, 129,065,925 acres had been allotted by the end of 1900, while 48,695,897 acres were still undisposed of. The area under forests throughout the colony is over 537 square miles (343,680 acres); they yield large quantities of valuable timber, and are under the control of the Department of Agriculture, which was instituted in 1887, and for which a special ministry has been created. This department has done much good work since its institution, especially by introducing French-American resistant stocks into the vineyards, which had suffered very severely from the ravages of the phylloxera, by improving the breed of horses, by establishing an animal bacteriological laboratory, and by practically stamping out the rinderpest. In the old colony and native territories there were produced in the year ending 31st May 1899—of wheat, 2,220,747 bushels; oats, 1,810,611 bushels; barley, 830,730 bushels; mealies, 2,857,809 bushels; Kaffir corn, 2,000,000 bushels; rye, 304,491 bushels; and oat-hay, 14,547,044 bundles of about 5½ lb. There were 83,000,000 vine-stocks, yielding 4,824,432 gallons of wine, and 1,107,344 gallons of brandy. There were also fruit trees (peach, apricot, apple, pear, plum, fig, orange, lemon, and naartjie) to the number, in 1898, of 4,195,624. The chief pastoral products were—wool, 35,179,900 lb; mohair, 6,707,379 lb; ostrich feathers, 278,167 lb; and butter, 2,879,000 lb. There were 1,077,044 head of cattle, 387,824 horses, 90,379 mules and asses, 12,639,992 sheep, 5,572,793 Angora and other goats, 245,947 pigs, and 260,672 ostriches. Except in the case of ostriches, these figures are all much lower than those returned in 1891 for the colony as then constituted, and in particular the number of cattle, owing to the ravages of rinderpest in 1896, is less than one-half that returned in the former year. Farms in tillage are comparatively small, but those devoted to the rearing of sheep are very large, ranging from 3000 acres to 15,000 acres and more. For the most part the graziers own the farms they occupy. Perhaps here may be best introduced a reference to the gradual extermination of the big game. The larger "wild animals," with the exception of the elephant and the Cape tiger (leopard), are practically extinct in the old colony. Bucks (antelopes), however, of all sorts, and smaller game, including many varieties of birds, are now protected by laws establishing close seasons.

Fisheries.—These are under the Department of Agriculture, which has done much to develop them. For several years a Government expert has been employed in exploring the fishing-grounds, and examining the habits of the fish, their probable quantity, &c., all round the coast. The result seems to show that the fishing-grounds could furnish an abundant supply to trawlers. Salmon and trout have been introduced into the rivers with very satisfactory results.

Manufactures.—Excluding mines, industrial establishments producing goods to the value of £100 and upwards employed altogether,

in 1891, 17,062 persons, producing manufactures, &c., valued at £3,560,004. Food, drinks, and stimulants provided the largest item, with 3931 persons, and goods to the value of over two millions sterling; after this came, in value, animal matter, vehicles and harness, dress, buildings, printing books and stationery, and vegetable matter, on each of which, except the last, over 1000 persons were employed. No other industry produced goods to the value of over £100,000, or employed over 1000 persons.

Commerce.—After making every allowance for the natural growth of the colony, it will be seen from the following table, giving the total values (including specie) of the imports and exports in various years since 1885, that, up to the breaking out of the Boer war, the trade of Cape Colony underwent a great development during the later years of the 19th century.

	1885.	1890.	1895.	1898.	1899.	1900.
Imports .	£ 4,991,688	£ 10,106,466	£ 19,094,880	£ 16,682,438	£ 19,207,549	£ 17,161,811
Exports .	£ 6,224,261	£ 9,910,370	£ 16,904,756	£ 25,318,701	£ 23,662,538	£ 7,646,682

In 1900 the specie imported was valued at £2,516,525, and the gross duty received on all imports amounted to £2,309,769. Apart from specie, the principal items in the list of imports in 1900 were textile fabrics, dress, &c., £4,301,331, and food, drinks, &c., £5,584,600. The principal items in the exports were raw gold, £336,795 (this, though not included in the imports, is first imported from the Transvaal, hence, largely, the big fall in the value of the exports in 1900); diamonds, £3,433,832; wool, £837,809; ostrich feathers, £876,801; hair (Angora), £489,905; copper ore, £498,552; and hides and skins, £346,800. During the preceding years of the decade, the lowest export of diamonds was £3,013,578 (1894), and the highest £4,775,016 (1895). The total value (partly estimated) of the diamond export from 1867 to 1900 was £95,447,399. The following table (specie excluded) shows the distribution of trade in 1885 and 1900. It will be seen that, in the imports, but not in the exports, the foreign trade has grown more proportionately than the British:—

Country.	Imports from		Exports to	
	1885.	1900.	1885.	1900.
United Kingdom .	£ 3,759,387	£ 11,052,428	£ 5,451,255	£ 6,854,175
British Possessions .	578,810	2,477,692	81,664	238,047
Foreign Countries .	434,707	3,631,691	278,525	554,460
Total {excluding Specie}	4,772,904	17,161,811	5,811,444	7,646,682

Of the imports in 1900, £1,772,580 were from the United States, and £551,101 from Germany.

Shipping and Navigation.—Harbours.—Since 1860 work has been constantly going on at the Cape Town breakwater and docks. When the works, at present being proceeded with, are completed, there will be an area of about 94 acres so entirely enclosed as to be safe from every wind. Up to 1901 about £3,000,000 had been spent. At Port Elizabeth, on the west shore of Algoa Bay, only jetties have as yet been provided, at which cargoes are landed by lighters from vessels lying at anchor in the roadstead, though by

FOREIGN TRADE.

	1885.		1895.		1900.	
	No.	Tonnage.	No.	Tonnage.	No.	Tonnage.

COASTING TRADE.

	1885.		1895.		1900.	
	No.	Tonnage.	No.	Tonnage.	No.	Tonnage.
Entrances . .	1298	1,896,392	1167	3,141,932	1266	4,608,893
Clearances . .	1300	1,904,799	1170	3,158,895	1266	4,558,851

far the largest amount of landing of goods is done here. At East London, at the mouth of the Buffalo river, works have been in

progress for many years, with a view to doing away with the bar at the river mouth, and at present vessels drawing about 20 feet of water can discharge cargo at the wharves in the river. At Mossel Bay the arrangements for landing passengers and goods are the same as at Port Elizabeth, only on a much smaller scale; but railway communication, which this part is now for the first time to enjoy, will probably lead to a considerable development of the harbour works. At Port Alfred, at the Kowie mouth, a sum of over three-quarters of a million sterling has been expended, but the average depth of water on the bar is now only about half what it was before the works were commenced, and they have in consequence been practically abandoned. Between Cape Town and East London inclusive, there are sixteen lighthouses. The registered shipping is still comparatively small, amounting in 1900 to only 37 vessels of 5936 tons, of which 31 of 5483 tons were steamers. The tonnage of the shipping engaged in the foreign and coasting trades has, however, grown considerably, as will be seen from the tables at the foot of the previous page. Of the foreign entrances in 1900, 484 of 1,544,084 tons were British; of the clearances, 856 of 2,538,463 tons.

Internal Communications—Railways, &c.—In 1875 the only railway ran from Cape Town to Wellington, a distance of 45 miles, while parliamentary sanction had just been given, and money voted, for starting what have since developed into three systems: the Western, the Midland, and the Eastern, the main lines of which proceed from the three principal seaports—Cape Town, Port Elizabeth, and East London, towards Kimberley and the north. The *Western System* starts from Cape Town, and runs by Kimberley to Vryburg and Mafeking, from which it is continued by the Rhodesian railway to Bulawayo. The total length of the main line is over 1360 miles. Branches run from Cape Town or its immediate neighbourhood to Simon's Town (22 miles), to Caledon (67 miles), and to Pickenier's Kloof by Malmesbury (126 miles). From Worcester a line constructed by a private company, with Government subsidy, runs by Swellendam to Riversdale (147 miles). The *Midland System* starts from Port Elizabeth, and the main line runs by Cradock and Naauwpoort to Norval's Pont on the Orange river, from which it is continued through the Orange River Colony and the Transvaal by Bloemfontein to Johannesburg and Pretoria. The total length of the main line is over 740 miles. From Port Elizabeth a second line (186 miles) runs by Uitenhage and Graaff Reinet, rejoining the main line at Rosmead, from which a junction line (83 miles) runs eastwards, connecting with the eastern system at Stormberg. From Naauwpoort another junction line (about 70 miles) runs north-west, connecting the Midland with the Western system at De Aar. A short branch runs from Alicedale to Grahamstown, from which a line (43 miles), owned by a private company, runs south-east to Port Alfred at the mouth of the Kowie. The *Eastern System* starts from East London, and the main line ran at first to Aliwal North on the Orange river, a distance of 280 miles. After the Midland system was completed to Johannesburg, however, a connecting line was built from Albert Junction, near Burghersdorp, by Bethulie on the Orange river to Springfontein, in what was then the Orange Free State. The distance from East London to Springfontein is 313 miles. A short branch from Blaney runs to King William's Town, and a light railway of the standard gauge has been opened from Queenstown to Tarkastad (31 miles). A private railway runs eastwards from Sterkstroom to the Indwe coal-mines (66 miles). From Cookhouse, on the eastern branch of the Midland system, a line is in process of construction by a private company subsidized by Government, westwards to Somerset East and eastwards to King William's Town; while from Klipplaat, on the western branch of the same system, a line is being constructed under similar conditions to Oudtshoorn and Mossel Bay. It is generally believed that when the gaps in this chain of railways are filled up, they will form the main railway route from Cape Town to Natal. The standard gauge of the railways in South Africa is 3 feet 6 inches, the exceptions being the Beira railway, the private railway running from Port Nolloth on the west coast to the O'Okiep copper mines (92 miles), and the light two-foot-gauge railway under construction, as an experiment, from Port Elizabeth to Avontuur. At the end of 1900, the length of Government railways in actual use was 2089, while 670 miles of line were under construction. There were also 400 miles of private railways. The capital expended on Government railways to the end of 1900 was £21,842,216, showing a cost per mile of £10,456. The gross earnings in 1900 were £3,520,537, and the expenses, £2,198,205; the number of passengers conveyed was 13,640,414, and the tonnage of goods, 1,370,248 (of 2000 lb). Electric tramways run in Cape Town and suburbs, Port Elizabeth, East London, and Kimberley, but in the case of the last-mentioned town horse and mule trams are still more general. In the old colony there are over 8000 miles of roads.

Posts and Telegraphs.—The number of post-offices at the end of 1898 was 942; the revenue in 1900 amounted to £342,431, and the expenditure to £346,979. The total number of letters despatched to England from the general post-office, Cape Town, in 1900 was

49,358,840 (nearly double the normal number), and of newspapers and book packets, 1,797,540. Almost every village in South Africa is connected with the outer world by telegraph, and at the end of 1900 there were 7467 miles of line (22,597 miles of wire), with 494 offices, besides 1723 miles of telephone wire. The number of telegraphic messages sent in 1900 was 3,562,039. The telegraphs were constructed at the expense of the Government, 781 miles of line having been taken over from a company in 1873. The revenue in 1900 was £202,454 (exclusive of £244,766, the value of Government messages), and the expenditure, £205,986.

Banks.—The following table gives statistics of the banks under trust laws:—

31st December.	Including Head Offices.			Circulation, Colony only.	Assets and Liabilities, Colony only.
	Capital.	Paid Up.	Reserve.		
1890 . .	£5,780,610	£1,558,612	£850,489	£740,210	£9,221,661
1895 . .	7,189,090	2,382,008	1,003,837	612,286	11,864,152
1900 . .	12,166,800	6,508,308	1,810,621	2,042,059	48,068,445

Money, Weights, and Measures.—Though all the standards are British, the following old Dutch measures are still used:—*Liquid Measure*: Leaguer = about 128 imperial gallons; half aum = 15½ imperial gallons; anker = 7½ imperial gallons. *Capacity*: Muid = 3 bushels. The general surface measure is the old Amsterdam *Morgen*, reckoned equal to 2.11654 acres; 1000 Cape lineal feet are equal to 1033 British imperial feet.

RECENT HISTORY.

The year 1870 marks the dawn of a new era in South Africa. From that date the development of modern South Africa may be said to have fairly started, and in spite of political complications, arising from time to time, the progress of Cape Colony down to the outbreak of the Transvaal war of 1899 was steadily forward. The discovery of diamonds on the Orange river in 1867, followed immediately afterwards by the discovery of diamonds on the Vaal river, led to the rapid occupation and development of a tract of country which had hitherto been but sparsely inhabited. In 1870 Dutoitspan and Bultfontein diamond mines were discovered, and in 1871 the still richer mines of Kimberley and De Beers. These four great deposits of mineral wealth are still richly productive, and although not technically within the confines of Cape Colony till 1880, to-day they constitute the

greatest industrial asset which the colony possesses. At the time of the beginning of the diamond industry, both Cape Colony and the Boer Republics, as well as all the rest of the colonies of South Africa, were in a very depressed condition. Ostrich-farming was in its infancy, and agriculture but little developed. The Boers, except in the immediate vicinity of Cape Town, were a primitive people. Their wants were few, they lacked enterprise, and the trade of the colony was restricted. Even the British colonists at that time were far from rich. The diamond industry therefore offered considerable attractions, especially to colonists of British origin. It was also the means at length of demonstrating the fact that South Africa, barren and poor on the surface, was rich below the surface. It takes ten acres of Karroo to feed a sheep, but it was now seen that a few square yards of diamondiferous blue ground would feed a dozen families. By the end of 1871 a large population had already gathered at the diamond fields, and immigration continued steadily, bringing new-comers to the rich fields. Among those who emigrated to South Africa at that time was Mr Cecil Rhodes.

So far back in the history of the colony as 1858, the then Governor, Sir George Grey, had prepared for the home authorities a scheme for the federation of the various colonies and states of South Africa, but this proposition was not entertained at the time. In 1875, Lord Carnarvon, who was Secretary of State for the Colonies, and who had been successful in aiding to bring about the federation of Canada, turned his attention to a similar scheme for the confederation of South Africa. The new Parliament at Cape Town, which had received its privileges of self-government in 1872, appears to have resented the despatch in which he propounded his suggestions, and passed a resolution stating that any scheme in favour of confederation must in their opinion originate within South Africa itself. James Anthony Froude, the distinguished historian, was sent out by Lord Carnarvon to further his policy in South Africa. As a diplomatist and a representative of the British Government, the general opinion in South Africa was that Froude was not a success, and he entirely failed to induce the colonists to adopt Lord Carnarvon's views. In 1876, Fingoland, the Idutywa reserve, and Noman's-land, tracts of country on the Kaffir frontier, were annexed to Cape Colony, on the understanding that the Cape Government should provide for their government. Lord Carnarvon, still bent on confederation, now appointed Sir Bartle Frere Governor of Cape Colony and High Commissioner of South Africa.

Frere had no sooner taken office as High Commissioner, than he found himself confronted with serious native troubles in Zululand and on the Kaffir frontier of Cape Colony. In 1877 there occurred an outbreak on the part of the Galekas and the Gaikas. A considerable force of Imperial and Colonial troops was employed to put down this rising, and the war was subsequently known as the Ninth Kaffir war. This war was the last of a long series which the colonists waged on the eastern frontier ever since the colony came into existence. At its conclusion the Transkei, the territory of the Galeka tribe, under Krela, was annexed by the British. In the meantime Lord Carnarvon had resigned his position in the British Cabinet, and the scheme for confederation which he had been pushing forward was abandoned. As a matter of fact, at that time Cape Colony was too fully occupied with native troubles to take into consideration very seriously so great a question as confederation. A wave of feeling spread amongst the different Kaffir tribes on the colonial frontier, and after the Gaika-Galeka war there followed in 1879 a rising in Basutoland under

Moirosi, whose cattle-raiding had for some time past caused considerable trouble. His stronghold was taken after very severe fighting by a colonial force, but, their defeat notwithstanding, the Basutos remained in a restless and aggressive condition for several years. In 1880 the colonial authorities endeavoured to extend to Basutoland the Peace Preservation Act of 1878, under which a general disarmament of the Basutos was attempted. Further fighting followed on this proclamation, which was by no means successful, and although peace was declared in the country in 1883, the colonial authorities were very glad in 1884 to be relieved of the administration of a country which had already cost them £3,000,000. The Imperial Government then took over Basutoland as a Crown colony, on the understanding that Cape Colony should contribute for administrative purposes £18,000 annually. In 1880, Sir Bartle Frere, who by his energetic and statesmanlike attitude on the relations with the native states, as well as on all other questions, had won the esteem and regard of loyal South African colonists, was recalled by Lord Kimberley, the Liberal Secretary of State for the Colonies, and was succeeded by Sir Hercules Robinson. Griqualand West, which included the diamond fields, was now incorporated as a portion of Cape Colony.

The Boer war of 1881, with its disastrous termination, naturally reacted throughout South Africa; and as one of the most important results, in the year 1882 the first Afrikaner Bond Congress was held at Graaff Reinet. The organization of the Bond developed into one embracing the Transvaal, the Orange Free State, and Cape Colony. Each country had a provincial committee with district committees, and branches were distributed throughout the whole of South Africa. At a later date the Bond in the Cape Colony dissociated itself from its Republican branches. The general lines of policy which this organization endeavoured to promote may best be gathered from *De Patriot*, a paper published in the colony, and an avowed supporter of the organization. The following extracts from articles published in 1882 will illustrate, better than anything else, the ambition entertained by some of the promoters of this remarkable organization.

"The Afrikaner Bond has for its object the establishment of a South African Nationality by spreading a true love for what is really our fatherland. No better time could be found for establishing the Bond than the present, when the consciousness of nationality has been thoroughly aroused by the Transvaal war." . . . "The British Government keep on talking about a confederation under the British flag, but that will never be brought about. They can be quite certain of that. There is just one obstacle in the way of confederation, and that is the British flag. Let them remove that, and in less than a year the confederation would be established under the Free Afrikaner flag." "After a time the English will realize that the advice given them by Froude was the best—they must just have Simon's Bay as a naval and military station on the way to India, and give over all the rest of South Africa to the Afrikanders." . . . "Our principal weapon in the social war must be the destruction of English trade by our establishing trading companies for ourselves." . . . "It is the duty of each true Afrikaner not to spend anything with the English that he can avoid."

De Patriot afterwards became imperialist, but *Ons Land*, another Bond organ, continued in much the same strain.

In addition to having its press organs, the Bond from time to time published official utterances less frank in their tone than the statements of its press. Some of the Articles of the Bond's original manifesto are entirely praiseworthy, e.g., those referring to the administration of justice, the honour of the people, &c.; such clauses as these, however, were meaningless in view of the enlightened government which obtained in Cape Colony, and for the true "inwardness" of this document it is necessary to note Article 3, which distinctly speaks of

the promotion of South Africa's independence (*Zelfstandigheid*). If the Bond aroused disloyalty and mistaken aspirations in one section of the Cape inhabitants, it is equally certain that it caused a great wave of loyal and patriotic enthusiasm to pass through another and more enlightened section. A pamphlet written in 1885 for an association called the Empire League by Mr Charles Leonard, who afterwards consistently championed the cause of civil equality and impartial justice in South Africa, maintained as follows:—

“(1) That the establishment of the English Government here was beneficial to all classes; and (2) that the withdrawal of that Government would be disastrous to every one having vested interests in the colony. . . . England never can, never will, give up this colony, and we colonists will never give up England. . . . Let us, the inhabitants of the Cape Colony, be swift to recognize that we are one people, cast together under a glorious flag of liberty, with heads clear enough to appreciate the freedom we enjoy, and hearts resolute to maintain our true privileges; let us desist from reproaching and insulting one another, and, rejoicing that we have this goodly land as a common heritage, remember that by united action only can we realize its grand possibilities. We belong both of us to a home-loving stock, and the peace and prosperity of every home in the land is at stake. On our action now depends the question whether our children shall curse or bless us; whether we shall live in their memory as promoters of civil strife, with all its miserable consequences, or as joint architects of a happy, prosperous, and united state. Each of us looks back to a noble past. United, we may ensure to our descendants a not unworthy future. Disunited, we can hope for nothing but stagnation, misery, and ruin. Is this a light thing?”

It is probable that many Englishmen reading Mr Leonard's manifesto at the time regarded it as unduly alarming, but subsequent events proved the soundness of the views it expressed. The fact is that, from 1881 onwards, two great rival ideas came into being, each strongly opposed to the other. One was that of Imperialism—full civil rights for every civilized man, whatever his race might be, under the supremacy and protection of Great Britain. The other was nominally republican, but in fact exclusively oligarchical and Dutch. The policy of the extremists of this last party was summed up in the appeal which President Kruger made to the Free State in February 1881, when he bade them “Come and help us. God is with us. It is His will to unite us as a people”—“to make a united South Africa free from British authority.” The two actual founders of the Bond party were Mr Borckenhagen, a German who was residing in Bloemfontein, and Mr Reitz, afterwards State Secretary of the Transvaal. Two interviews have been recorded which show the true aims of these two promoters of the Bond at the outset. One occurred between Mr Borckenhagen and Mr Rhodes, the other between Mr Reitz and Mr T. Schreiner, whose brother became, at a later date, Prime Minister of Cape Colony. In the first interview Mr Borckenhagen remarked to Mr Rhodes: “We want a united Africa,” and Mr Rhodes replied: “So do I.” Mr Borckenhagen then continued: “There is nothing in the way; we will take you as our leader. There is only one small thing; we must, of course, be independent of the rest of the world.” Mr Rhodes replied: “You take me either for a rogue or a fool. I should be a rogue to forfeit all my history and my traditions; and I should be a fool, because I should be hated by my own countrymen and mistrusted by yours.” But as Mr Rhodes truly said at Cape Town in 1898, “The only chance of a true union is the overshadowing protection of a supreme power, and any German, Frenchman, or Russian would tell you that the best and most liberal power is that over which Her Majesty reigns.” The other interview took place at the beginning of the Bond's existence. Being approached by Mr Reitz, Mr T. Schreiner objected that the Bond aimed

ultimately at the overthrow of British rule and the expulsion of the British flag from South Africa. To this Mr Reitz replied: “Well, what if it is so?” Mr Schreiner expostulated in the following terms: “You do not suppose that that flag is going to disappear without a tremendous struggle and hard fighting?” “Well, I suppose not, but even so, what of that?” rejoined Mr Reitz. In the face of this testimony with reference to two of the most prominent of the Bond's promoters, it is impossible to deny that from its beginning the great underlying idea of the Bond was an independent South Africa.

In 1882 an Act was passed in the Cape Legislative Assembly, empowering members to speak in the Dutch language on the floor of the House, if they so desired. The intention of this Act was a liberal one, but the moment of its introduction was inopportune, and its effect was to give an additional stimulus to the policy of the Bond. It was probably also the means of bringing into the House a number of Dutchmen, by no means well educated, who would not have been returned had they been obliged to speak English. By this Act an increase of influence was given to the Dutch leaders. The head of the Afrikaner Bond at this time in Cape Colony, and the leader of Dutch opinion, was Mr J. H. Hofmeyr, a man of undoubted ability and astuteness. Although he was recognized leader of the Dutch party in Cape Colony, he consistently refused to take office, preferring to direct the policy and the action of others from an independent position. Mr Hofmeyr sat in the House of Assembly as member for Stellenbosch, a strong Dutch constituency. His influence over the Dutch members was supreme, and in addition to directing the policy of the Bond within the Cape Colony, he supported and defended the aggressive expansion policy of President Kruger and the Transvaal Boers. In 1883, during a debate on the Basutoland Annexation Bill, Mr Rhodes openly charged Mr Hofmeyr in the House with a desire to see a “United States of South Africa under its own flag.” In 1884 Mr Hofmeyr led the Bond in strongly supporting the Transvaal Boer raiders in Bechuanaland, proclaiming that if the Bechuanaland freebooters were not permitted to retain the territories they had seized, in total disregard of the terms of the Conventions, there would be rebellion among the Dutch of Cape Colony. Fortunately, however, for the peace of Cape Colony at that time, Sir Charles Warren removed the invading Boers from Stellaland and no rebellion occurred. Nevertheless the Bond party was so strong in the House that they compelled the ministry under Sir Thomas Scanlen to resign in 1884. The logical and constitutional course for Mr Hofmeyr to have followed in these circumstances would have been to accept office and himself form a government. This he refused to do. He preferred to put in a nominee of his own who should be entirely dependent on him. Mr Upington, a clever Irish barrister, was the man he selected, and under him was formed in 1884 what will always be known in Cape history as the “Warming-pan” ministry. This action was denounced by many British colonists, who were sufficiently loyal, not only to Great Britain, but also to that constitution which had been conferred by Great Britain upon the Cape Colony, to desire to see the man who really wielded political power also acting as the responsible head of the party. It was Mr Hofmeyr's refusal to accept this responsibility, as well as the nature of his Bond policy, which won for him the political sobriquet of “The Mole.” Open and responsible exercise of a power conferred under the constitution of the country, Englishmen and English colonists would have accepted and even welcomed. But that subterranean method of Dutch policy which found its strongest

expression in Pretoria, and which operated from Pretoria to Cape Town, could not but be resented by loyal colonists. From 1881 down to 1898, Mr Hofmeyr practically determined how Dutch members should vote, and also what policy the Bond should adopt at every juncture in its history. The influence of this action on Cape politics was a demoralizing one. Other well-known politicians at the Cape subsequently found it convenient to adapt their views a good deal too readily to those held by the Bond. In justice to Mr Hofmeyr, however, it is only fair to say that after the Warren expedition in 1884, which was at least evidence that Great Britain did not intend to renounce her supremacy in South Africa altogether, he adopted a less hostile or anti-British attitude. The views and attitude of Mr Hofmeyr between 1881 and 1884—when even loyal British colonists, looking to the events which followed Majuba, had almost come to believe that Great Britain had little desire to maintain her supremacy—can scarcely be wondered at.

Recognizing the difficulties of the position, Mr Rhodes from the outset of his political career showed his desire to conciliate Dutch sentiment by considerate treatment and regard for Dutch prejudices. Mr Rhodes was first returned as member of the House of Assembly for Barkly West in 1880, and in spite of all vicissitudes this constituency remained loyal to him. He supported the Bill permitting Dutch to be used in the House of Assembly in 1882, and early in 1884 he first took office, as Treasurer-General, under Sir Thomas Scanlen. Mr Rhodes had only held this position for six weeks when Sir Thomas Scanlen resigned, and later in the same year he was persuaded by Sir Hercules Robinson to proceed to British Bechuanaland as Special Commissioner in succession to Mr Mackenzie. In 1885 the territories of Cape Colony were further extended, and Tembuland, Bomvanaland, and Galekaland were formally added to the colony. In 1886 Sir Gordon Sprigg succeeded Sir Thomas Upington as Prime Minister.

The period from 1878 to 1885 in Cape Colony had been one of considerable unrest. In this short time there occurred a series of native disturbances which were followed by the Boer war of 1881, and the Bechuanaland disturbances of 1884. In spite, however, of these drawbacks, the development of the country proceeded. The diamond industry was flourishing. In 1887 a conference was held in London for "promoting a closer union between the various parts of the British Empire by means of an Imperial tariff of customs." At this conference it is worthy of note that Mr Hofmeyr propounded a sort of "Zollverein" scheme, in which Imperial customs were to be levied independently of the duties payable on all goods entering the empire from abroad. In making the proposition he stated that his objects were "to promote the union of the empire, and at the same time to obtain revenue for the purposes of general defence." The scheme was not at the time found practicable. But its authorship, as well as the sentiments accompanying it, created a favourable view of Mr Hofmeyr's attitude. In the year 1888, in spite of the failure of statesmen and High Commissioners to bring about political confederation, the members of the Cape Parliament set about the establishment of a South African Customs Union. A Customs Union Bill was passed, and this in itself constituted a considerable development of the idea of federation. Shortly after the passing of the Bill the Orange Free State entered the Union. An endeavour was also made then, and for many years afterwards, to get the Transvaal to join. But President Kruger, consistently pursuing his own policy, hoped through the Delagoa Bay Railway to make the South African Republic entirely independent

of Cape Colony. The endeavour to bring about a Customs Union which would embrace the Transvaal was also little to the taste of President Kruger's Hollander advisers, interested as they were in the Netherlands Railway schemes.

Another event of considerable commercial importance to the Cape Colony, and indeed to South Africa, was the amalgamation of the diamond-mining companies, chiefly brought about by Mr Cecil Rhodes, Mr Alfred Beit, and Mr Barnato in 1889. One of the principal and most beneficial results of the discovery and development of the diamond mines was the great impetus which it gave to railway extension. Lines were opened up to Worcester and Beaufort West, to Grahamstown, Graaff Reinet, and Queenstown. Kimberley was reached in 1885. In 1890 the line was extended northwards on the western frontier of the Transvaal as far as Vryburg in Bechuanaland. In 1889 the Free State entered into an arrangement with the Cape Colony whereby the main trunk railway was extended to Bloemfontein, the Free State receiving half the profits. Subsequently the Free State bought at cost price the portion of the railway in its own territory. In 1891 the Free State Railway was still further extended to Viljoen's Drift on the Vaal river, and in 1892 it reached Pretoria and Johannesburg.

In 1889 Sir Henry Loch was appointed High Commissioner and Governor of Cape Colony in succession to Sir Hercules Robinson. In 1890 Sir Gordon Sprigg, the Premier of the colony, resigned, and a Government was formed under Mr Rhodes. Prior to the formation of this ministry (see Table at end of article), and while Sir Gordon Sprigg was still in office, Mr Hofmeyr approached Mr Rhodes and offered to put him in office as a Bond nominee. This offer Mr Rhodes declined. When, however, he was invited to take office after the downfall of the Sprigg ministry, he asked the Bond leaders to meet him and discuss the situation. His policy of Customs union and railway union between the various states, added to the personal esteem in which he was at this time held by many of the Dutchmen, enabled him to undertake and to carry on successfully the business of government.

The colonies of British Bechuanaland and Basutoland were now taken into the Customs Union existing between the Orange Free State and Cape Colony. Pondoland, another native territory, was added to the colony in 1894, and the year was marked by a departure in native policy for which Mr Rhodes was chiefly responsible. It dealt with the natives residing in certain native reserves, and in addition to providing for their interests and holdings, and in other ways protecting the privileges accorded to them, the principle of the duty of some degree of labour devolving upon every able-bodied native enjoying these privileges was asserted, and a small labour tax was levied. This Act, entitled the Glen Grey Act, enjoined that "every male native residing in the district, exclusive of natives in possession of lands under ordinary quit-rent titles, or in freehold, who, in the judgment of the resident magistrate, is fit for and capable of labour, shall pay to the public revenue a tax of ten shillings per annum unless he can show to the satisfaction of the magistrate that he has been in service beyond the borders of the district for at least three months out of the previous twelve, when he will be exempt from the tax for that year, or unless he can show that he has been employed for a total period of three years, when he will be exempt altogether." This is in many respects the most statesmanlike Act dealing with natives on the statute-book; and in the session of 1895 Mr Rhodes was able to report to the Cape Parliament that the Act then applied to 160,000 natives.

During 1895 Sir Hercules Robinson was reappointed Governor and High Commissioner of South Africa in succession to Sir Henry Loch, and in the same year Mr Chamberlain became Her Majesty's Secretary of State for the Colonies.

With the development of railways, and the extension of trade between Cape Colony and the Transvaal, there had grown up a closer relationship of political questions. Whilst Premier of Cape Colony, by means of the Customs Union and in every other way, Mr Rhodes endeavoured to bring about a friendly measure of at least commercial federation among the states and colonies of South Africa. He hoped to establish both a commercial and a railway union, and a speech which he made in 1894 at Cape Town admirably describes this policy:—

“With full affection for the flag which I have been born under, and the flag I represent, I can understand the sentiment and feeling of a republican who has created his independence, and values that before all; but I can say fairly that I believe in the future that I can assimilate the system, which I have been connected with, with the Cape Colony, and it is not an impossible idea that the neighbouring Republics, retaining their independence, should share with us as to certain general principles. If I might put it to you, I would say the principles of tariffs, the principle of railway connexion, the principle of appeal in law, the principle of coinage, and in fact all those principles which exist at the present moment in the United States, irrespective of the local assemblies which exist in each separate state in that country.”

To this policy President Kruger and his Government offered every possible opposition. Their action in what is known as the Vaal River Drift question will best illustrate the line of action which the Transvaal Government believed it expedient to adopt. A difficulty arose at the termination of the agreement in 1894 between the Cape Government Railway and the Netherlands Railway. The Cape Government, for the purposes of carrying the railway from the Vaal river to Johannesburg, had advanced the sum of £600,000 to the Netherlands Railway and the Transvaal Government conjointly; at the same time it was stipulated that the Cape Government should have the right to fix the traffic rate until the end of 1894, or until such time as the Delagoa Bay-Pretoria line was completed. These rates were fixed by the Cape Government at 2d. per ton per mile, but at the beginning of 1895 the rate for the 52 miles of railway from the Vaal river to Johannesburg was raised by the Netherlands Railway Company to no less a sum than 8d. per ton per mile. It is quite evident from the action which President Kruger subsequently took in the matter that this charge was put on with his approval, and with the object of compelling traffic to be brought to the Transvaal by the Delagoa route, instead of as heretofore by the Colonial Railway. In order to compete against this very high rate, the merchants of Johannesburg began removing their goods from the Vaal river by waggon. Thereupon President Kruger arbitrarily closed the drifts (fords) on the Vaal river, and thus prevented through waggon traffic, causing an enormous block of waggons on the banks of the Vaal. A protest was then made by the Cape Government against the action of the Transvaal, on the ground that it was a breach of the London Convention. President Kruger took no notice of this remonstrance, and an appeal was made to the Imperial Government; whereupon the latter entered into an agreement with the Cape Government, to the effect that if the Cape would bear half the cost of any expedition which should be necessary, assist with troops, and give full use of the Cape Railway for military purposes if required, a protest should be sent to President Kruger on the subject. These terms were accepted by Mr Rhodes and his colleagues, of whom Mr. W. P. Schreiner was one, and a protest was then sent by Mr Chamberlain stating that Her Majesty's

Government would regard the closing of the drifts as a breach of the London Convention, and as an unfriendly action calling for the gravest remonstrance. President Kruger at once reopened the drifts, and undertook that he would issue no further proclamation on the subject except after consultation with the Imperial Government.

In the year 1895 the Jameson Raid occurred, and Mr Rhodes's complicity in this movement compelled him to resign the Premiership of Cape Colony in January 1896. As Mr Rhodes's complicity in the Raid became known, there naturally arose a strong feeling of resentment and astonishment among his colleagues in the Cape ministry, who had been kept in complete ignorance of his connexion with any such scheme. Mr Hofmeyr and the Bond were loud in their denunciation of him. After his resignation, Mr Rhodes was proceeding to the north, when he received a summons from the Chartered Company to go to London; but after interviews with the directors in London, he went back to Rhodesia, and was present in the country during the Matabele rebellion. While hostilities were still proceeding in Matabeleland, Mr Rhodes went unarmed to a meeting of Matabele Indunas (chiefs) in the heart of the Matopopo hills. The result was not a massacre of the great white chief, as was foretold at the time, and as has occurred on similar occasions in attempted negotiations with Bantu tribes, but a peace which terminated the rebellion. It was a master-stroke of diplomacy and courage. The Matabele rising ended, Mr Rhodes travelled down through the colony on his way to attend the inquiry of the British South Africa Select Committee at Westminster, which had been appointed to investigate the causes of the Raid. The memory of the Raid, and Mr Rhodes's complicity in it, was still fresh in men's minds, the Cape Parliament having itself brought out the main facts by means of a committee of their own. But, nevertheless, so high was the esteem in which he was held that at both Port Elizabeth and Cape Town he met with an enthusiastic reception, and even at the Paarl, a Dutch centre in the Western Province, he was presented with an address signed by farmers, of whom the majority were Dutchmen. In 1897 a native rising occurred under Galeshwe, a Bantu chief, in Griqualand West. Galeshwe was arrested and the rebellion repressed. On cross-examination Galeshwe stated that Bosman, a magistrate of the Transvaal, had supplied ammunition to him, and urged him to rebel against the Government of Cape Colony. There is every reason to suppose that this charge was true, and it is consistent with the intrigues which the Boers have from time to time practised among the natives.

In 1897 Sir Alfred Milner was appointed High Commissioner of South Africa and Governor of Cape Colony in succession to Sir Hercules Robinson, who was created a peer under the title of Baron Rosmead.

In 1898 commercial federation in South Africa advanced another stage, Natal entering the Customs Union. A fresh convention was drafted at this time, and under it “a uniform tariff on all imported goods consumed within such Union, and an equitable distribution of the duties collected on such goods amongst the parties to such Union, and free trade between the colonies and state in respect of all South African products,” was arranged. In the following year the Cape Parliamentary election occurred, and the result was the return to power of a Bond ministry under Mr W. P. Schreiner. From this time, until June 1900, Mr Schreiner remained in office as head of the Cape Government. During the negotiations which preceded the war in 1899, feeling at the Cape ran very high, and Mr Schreiner's attitude has been freely discussed. As head of a party, dependent for its position

in power on the Bond's support, his position was undoubtedly a trying one. At the same time, as Prime Minister of a British colony, it was strongly felt by loyal colonists that he should at least have refrained from openly interfering between the Transvaal and the Imperial Government during the course of most difficult negotiations. His public expressions of opinion were hostile in tone to the policy pursued by Mr Chamberlain and Sir Alfred Milner. The effect of them, it was believed, might conceivably be to encourage President Kruger in persisting in his rejection of the British terms. Mr Schreiner, it is true, used directly what influence he possessed to induce President Kruger to adopt a reasonable course. But however excellent his intentions, his publicly expressed disapproval of the Chamberlain-Milner policy probably did more harm than his private influence with Mr Kruger could possibly do good. On 11th June 1899, shortly after the Bloemfontein Conference, from which Sir Alfred Milner had just returned, Mr Schreiner asked the High Commissioner to inform Mr Chamberlain that he and his colleagues agreed in regarding President Kruger's Bloemfontein proposals as "practical, reasonable, and a considerable step in the right direction." Early in June, however, the Cape Dutch politicians began to realize that President Kruger's attitude was not so reasonable as they had endeavoured to persuade themselves, and Mr Hofmeyr, accompanied by Mr Herholdt, the Cape Minister of Agriculture, visited Pretoria. On arrival, they found that the Transvaal Volksraad, in a spirit of defiance and even levity, had just passed a resolution offering four new seats in the Volksraad to the mining districts, and fifteen to exclusively burgher districts. Mr Hofmeyr, on meeting the executive, freely expressed indignation at these proceedings. Unfortunately, Mr Hofmeyr's influence was more than counterbalanced by an emissary from the Free State, Mr Abraham Fischer, who, while affecting to be a peacemaker, practically encouraged the Boer executive to take extreme measures. Mr Hofmeyr's established reputation as an astute diplomatist, and as the trusted leader for years of the Cape Dutch party, made him as powerful a delegate as it was possible to find. His political insight enabled him at once to see that a concession to those moderate franchise demands which constituted the substance of Sir Alfred Milner's proposals at Bloemfontein, and which came to be known as the "Milner Minimum," might safely be accepted by the Transvaal without jeopardizing its independence. He recognized that a free admission of the Uitlanders to the franchise, with some additional ten Uitlander seats in the Volksraad, would not only leave the independence of the Transvaal unimpaired, but would leave the Boers largely masters of the situation; while he trusted to time to reconcile other differences, such as the questions of voting for President and Commandant-General. If any emissary could accomplish anything in the way of persuading Mr Kruger, it was assuredly Mr Hofmeyr. Much was looked for from his mission by moderate men of all parties, and by none more so, it is fair to believe, than by Mr Schreiner. But Mr Hofmeyr's mission, like every other mission to Mr Kruger to induce him to take a reasonable and equitable course, proved entirely fruitless. He returned to Cape Town disappointed, but probably not altogether surprised at the failure of his mission. Meanwhile a new proposal was drafted by the Boer executive, which, before it was received in its entirety, or at least before it was clearly understood, elicited from Mr Schreiner a letter on 7th July to the *South African News*, in which, referring to his Government, he said:—

"While anxious and continually active with good hope in the cause of securing reasonable modifications of the existing repre-

sentative system of the South African Republic, this Government is convinced that no ground whatever exists for active interference in the internal affairs of that Republic."

This letter was precipitate and unfortunate. On 11th July, after seeing Mr Hofmeyr on his return, Mr Schreiner made a personal appeal to President Kruger to approach the Imperial Government in a friendly spirit. At this time an incident occurred which raised the feeling against Mr Schreiner to a very high pitch. On 7th July 500 rifles and 1,000,000 rounds of ammunition were landed at Port Elizabeth, consigned to the Free State Government, and forwarded to Bloemfontein. Mr Schreiner's attention was called to this consignment at the time, but he refused to stop it, alleging as his reason that, inasmuch as Great Britain was at peace with the Free State, he had no right to interdict the passage of arms through the Cape Colony. The British colonist is as capable of a grim jest as the Transvaal Boer, and this action of Mr Schreiner's won for him the nickname "Ammunition Bill." At a later date he was accused of delay in forwarding artillery and rifles for the defence of Kimberley, Mafeking, and other towns of the colony. The reason he gave for delay was that he did not anticipate war; and that he did not wish to excite unwarrantable suspicions in the minds of the Free State. His conduct in both instances may have been technically correct, but it was much resented by loyal colonists.

On 28th July Mr Chamberlain sent a conciliatory despatch to President Kruger, suggesting a meeting of delegates to consider and report on his last franchise proposals, which were complex to a degree. Mr Schreiner, on 3rd August, telegraphed to Mr Fischer begging the Transvaal to welcome Mr Chamberlain's proposal. At a later date, on receiving an inquiry from the Free State as to the movements of British troops, Mr Schreiner curtly refused any information, and referred the Free State to the High Commissioner. On 28th August Sir Gordon Sprigg in the House of Assembly moved the adjournment of the debate, to discuss the removal of arms to the Free State. Mr Schreiner, in reply, used expressions which called down upon him the severest censure and indignation, both in the colony and in Great Britain. He stated that, should the storm burst, he would keep the colony aloof with regard both to its forces and its people. In the course of the speech he also read a telegram from President Steyn, in which the president repudiated all contemplated aggressive action on the part of the Free State as absurd. The speech created a great sensation in the British press. It was probably forgotten at the time (though Lord Kimberley afterwards publicly stated it) that one of the chief reasons why the Gladstone Government had granted the retrocession of the Transvaal after Majuba, was the fear that the Cape Colonial Dutch would join their kinsmen if the war continued. What was a danger in 1881, Mr Schreiner knew to be a still greater danger in 1899. At the same time it is quite obvious, from a review of Mr Schreiner's conduct through the latter half of 1899, that he took an entirely mistaken view of the Transvaal situation. He evinced, as Premier of the Cape Colony, the same inability to understand the Uitlanders' grievances, the same futile belief in the eventual fairness of President Kruger, as he had shown when giving evidence before the British South Africa Select Committee into the causes of the Jameson Raid. Actual experience taught him that President Kruger was beyond an appeal to reason, and that the protestations of President Steyn were insincere. War had no sooner commenced with the ultimatum of the Transvaal Republic on 9th October 1899, than Mr Schreiner found himself called upon to deal with the conduct of

Cape rebels. The rebels joined the invading forces of President Steyn, whose false assurances Mr Schreiner had offered to an indignant House of Assembly only a few months before. The war on the part of the Republics was evidently not to be merely one of self-defence. It was one of aggression and conquest. Mr Schreiner ultimately addressed, as Prime Minister, a sharp remonstrance to President Steyn for allowing his burghers to invade the colony. He also co-operated with Sir Alfred Milner, and used his influence to restrain the Bond.

The first shot actually fired in the war was at Kraipan, a small railway station within the colony, forty miles south of Mafeking, a train being derailed, and ammunition intended for Colonel Baden-Powell seized. The effect of this was entirely to cut off Mafeking, the northernmost town in Cape Colony, and it remained in a state of siege for over seven months. On 16th October Kimberley was also isolated. Proclamations by the Transvaal and Free State annexing portions of Cape Colony were actually issued on 18th October, and included British Bechuanaland and Griqualand West, with the diamond fields. On 28th October Mr Schreiner signed a proclamation issued by Sir Alfred Milner as High Commissioner, declaring the Boer annexations of territory within Cape Colony to be null and void. The battles of Belmont, Graspan, and Modder River were all fought by Lord Methuen in November, on colonial soil, in his endeavour to force a passage through to the relief of Kimberley. The heavy British losses at Modderfontein on 29th November were followed by a reverse in Cape Colony at Stormberg, where an expedition under General Gatacre from Queenstown marched into a Boer ambush and was defeated. On the following day Lord Methuen suffered a severe check and heavy losses at Magersfontein. The effect of these engagements at the very outset of the war, occurring as they did within Cape Colony, was to offer every inducement to a number of the frontier colonial Boers to join their kinsmen of the Republics. The Boers are prolific, and their families large. Many younger sons from the colony, with nothing to lose, left their homes with horse and rifle to join the republican forces.

Meanwhile the loyal Cape colonists were chafing at the tardy manner in which they were enrolled by the Imperial authorities. It was not until after the arrival of Lord Roberts and Lord Kitchener at Cape Town on 10th January 1900 that these invaluable, and many of them experienced, men were freely invited to come forward. So strongly did Lord Roberts feel on the subject, that he at once made Colonel Brabant, a well-known and respected colonial veteran and member of the House of Assembly, a Brigadier-General, and started recruiting loyal colonists in earnest. On 15th February Kimberley was relieved by General French, and the Boer General, Cronje, evacuated Magersfontein, and retreated towards Bloemfontein. Mr Cecil Rhodes was shut up in Kimberley during the whole of the siege, and his presence there undoubtedly offered an additional incentive to the Boers to endeavour to capture the town, but his unique position and influence with the De Beers workmen enabled him to render yeoman service, and infused enthusiasm and courage into the inhabitants. The manufacture of a big gun, which was able to compete with the Boer "Long Tom," at the De Beers workshops, under Mr Rhodes's orders, and by the ingenuity of an American, Mr Labram, who was killed a few days after its completion, forms one of the most striking incidents of the war.

On 11th March Barkly East, a small town on the north-east frontier of the colony, which had been seized

by the rebels, was reoccupied by British forces, and by the 18th of March, Burghersdorp, Aliwal North, Herschel, Lady Grey, Frieska, and other frontier towns reported that the rebel movement had collapsed. Mafeking, where the beleaguered garrison maintained their gallant defence under Colonel Baden-Powell till 17th May, was relieved by a force, chiefly colonial, sent up from Kimberley. With this incident the Cape rebellion ended, and the colony was at least for a time delivered of the presence of hostile forces.

On 20th March Mr Rose-Innes, a prominent member of the House of Assembly, who for several years had held aloof from either party, and who also had defended Mr Schreiner's action with regard to the passage of arms to the Free State, addressed his constituents at Claremont in support of the annexation of both republics; and in the course of an eloquent speech he stated that in Canada, in spite of rebellions, loyalty had been secured from the French Canadians by free institutions. In South Africa they might hope that a similar policy would attain a similar result with the Boers. In June, Mr Schreiner, whose recent support of Sir Alfred Milner had incensed many of his Bond followers, resigned in consequence of the refusal of some of his colleagues to support the Disfranchisement Bill which he was prepared, in accordance with the views of the Home Government, to introduce for the punishment of Cape rebels. The bill certainly did not err on the side of severity, but disfranchisement for their supporters in large numbers was more distasteful to the Bond extremists than any stringency towards individuals. Sir Gordon Sprigg, who after a political crisis of considerable delicacy succeeded Mr Schreiner, and for the fourth time became Prime Minister, was able to pass the Bill with the co-operation of Mr Schreiner and his section. Towards the end of the year 1900 the war entered on a new phase, and took the form of guerilla skirmishes with scattered forces of marauding Boers. In December some of these bands entered the Cape Colony and endeavoured to induce colonial Boers to join them. In this endeavour they met at first with little or no success; but as the year 1901 progressed and the Boers still managed to keep the various districts in a ferment, it was deemed necessary by the authorities to proclaim martial law over the whole colony, and this was done on the 9th October 1901.

On 4th January 1901 Sir Alfred Milner was gazetted Governor of the Transvaal and Orange River Colony, being shortly afterwards created a peer as Lord Milner, and Sir Walter Hely-Hutchinson, Governor of Natal, was appointed his successor as Governor of the Cape Colony.

Since responsible government was first granted to Cape Colony it must be admitted that, in spite of the sinister Transvaal influence on the Bond, the system has, on the whole, worked smoothly and well. There have at least never occurred in the Cape Chamber such scenes as have disgraced more than one European legislative assembly in recent years, while the statute-book is evidence of the many useful and enlightened measures which have passed into law. Many writers have objected that much more ought to have been done by a body of educated men in matters of excise, remedial measures for a depressed agriculture, and other schemes of a similar character, but as against this there must be set an admirable system of colonial civil service, which administers and controls railways, post, telegraphs, education, and native affairs with excellent results, while the Customs Union is a real step towards a practical scheme of federation.

The public life of Cape Colony has produced many men of singular ability and accomplishments, some having been of European and others of colonial birth.

First and foremost stands the Right Hon. Cecil J. Rhodes. While quite a young man, he was sent by the Cape Government in 1884 as Deputy-Commissioner to Bechuanaland. The policy he there adopted was that of maintaining the "Suez Canal" of South Africa—the Bechuanaland route to the north—for Great

Britain at all costs. He first endeavoured to conciliate the Boers by every reasonable concession, and only when he found this task hopeless did he join the politicians at the Cape in the agitation which led to the Warren expedition. By this action the great northern trade route was kept open. In 1889 Mr Rhodes was chiefly instrumental in bringing about the amalgamation of the diamond mines of Kimberley, a measure which strengthened and conserved the great mineral resources of the diamond fields, and thus preserved for Cape Colony an industry which might have declined with over-production. It has been urged that this step greatly added to his own fortune, but of all the millionaires South Africa has produced none has recognized more liberally the obligations of wealth. It is recorded of the very negotiations which led to amalgamation that Mr Rhodes insisted on the application of what (following Mr Chamberlain in his "Radical days") he called the doctrine of ransom, whereby a certain portion of the immense wealth won by such a huge and lucrative corporation as the De Beers Consolidated Mines should be directly devoted to the development and progress of the country from which that wealth was derived. In this action he also received the support of Mr Alfred Beit. This policy has been accepted and in a considerable measure acted on by the De Beers directors, if not by all shareholders, and £500,000 was advanced to further the opening up of Rhodesia and railway extension. Under Mr Rhodes's chairmanship all local institutions were treated with a liberality foreign to most commercial concerns, and he on at least one occasion urged the desirability of investing De Beers funds for the furtherance of the fruit industry in the Western Province, many of the fruit-growers being without enough capital or the requisite knowledge to conduct this industry with much success. In his dealings with the natives of Cape Colony and elsewhere in South Africa, Mr Rhodes was particularly successful. He won their personal respect, and he was signally successful, both with the Pondos and the Matabele, in arranging their future government. He opposed the native liquor traffic, and at the risk of offending some of his supporters among the brandy farmers of the Western Province, he suppressed it entirely on the diamond mines, and restricted it as far as he was able in the native reserves and territories. Nevertheless the continuance of this traffic on colonial farms, as well as to some extent in the native territories and reserves, is a black spot in the annals of the Cape Colony. The Hottentots have been terribly demoralized, and even partially destroyed by it in the Western Province.

Mr Rhodes has been denounced by his enemies as an autocrat. In view of his successful conduct of the Premiership for several years, and his cordial relationship with many men of all parties, the charge cannot be considered a just one. At the same time he had a direct way of going to the heart of things, and sometimes of acting entirely on his own responsibility in matters of State importance. The leading instance of this was in the Jameson Raid. But another instance, which is not so widely known, and in which the result was beneficial to all concerned, deserves some notice. After the native territories east of the Kei had been added to Cape Colony, and were under colonial administration, a case of claim to inheritance came up for trial, and in accordance with the law of the colony, the Court held that the eldest son of a native was his heir. This decision created the strongest resentment among the people of the territory, as it was in distinct contradiction to native tribal law, which recognized the great son, or son of the chief wife, as heir. The Government were threatened with a native disturbance, when Mr Rhodes telegraphed his assurance that compensation should be granted, and that such a decision should never be given again. This assurance was accepted and tranquillity restored. At the close of the next session (that of 1894), after this incident had occurred, Mr Rhodes laid on the table a Bill drafted by himself, the shortest the House had ever seen. It provided that all civil cases were to be tried by magistrates, an appeal to lie only to the chief magistrate of the territory with an assessor. Criminal cases were to be tried before the judges of Supreme Court on circuit. The Bill was passed, and the effect of it was, inasmuch as the magistrates administered according to native law, that native marriage customs and laws (including polygamy) were legalized in these territories. Mr Rhodes had retrieved his promise, and no one who has studied and lived amongst the Bantu will question that the action taken was both beneficent and wise. When not engaged with Cape politics, Mr Rhodes turned his energies to the north, and Rhodesia has become a monument to his energy, ambition, and financial genius.

Sir Gordon Sprigg, four times Premier, has been associated with the Cape Parliament since 1873. In and out of office his zeal has been unflagging, and if he lacks those qualities which inspire enthusiasm, and are requisite in a great leader, he has at least been a model of industry. Among other prominent politicians have been Mr Rose-Innes, Mr J. X. Merriman, and Mr Schreiner. Mr Rose-Innes is a lawyer whose intellectual gifts and patriotism have never been impugned; he is not a "party man," and this has made him, on more than one occasion,

a somewhat difficult political ally. On the native question he has taken up a consistently strong attitude, defending their rights, and uncompromisingly opposing the native liquor traffic. Mr Thomas Fuller, the Cape Town representative, though he has remained outside office, has given staunch support to every enlightened liberal and progressive measure which has been brought forward. A man of exceptional culture and eloquence, he has made his influence felt, not only in politics, but in journalism, and every other branch of social and public life in the colony.

In literature, the colony has produced at least two authors whose works have taken their place among those of the best English writers of their day. The *History of South Africa*, by Mr G. M'Call Theal, will remain a classic work of reference. The careful industry and the lucidity which characterize Mr Theal's work, stamp him as a historian of whom South Africa may well be proud. In fiction, Olive Schreiner (Mrs Cronwright-Schreiner) produced, while still in her teens, the *Story of an African Farm*, a work which gave great promise of original literary genius. Her later works have scarcely fulfilled that promise. Unfortunately, she, in common with the rest of South Africa, was swept into the seething vortex of contemporary politics, and her political pamphlets will add nothing to her reputation as a writer, whatever value they may have as expressions of opinion. In music and painting there have been artists of talent in the Cape Colony, but the country is still too young, and the conditions of life too disturbed to allow such a development as has already occurred in Australia.

GOVERNORS AT THE CAPE SINCE INTRODUCTION OF RESPONSIBLE GOVERNMENT.

- 1870. Sir Henry Barkly.
- 1877. Sir Bartle Frere.
- 1880. Sir Hercules Robinson.
- 1889. Sir Henry Loch.
- 1895. Sir Hercules Robinson (Lord Rosmead).
- 1897. Sir Alfred Milner.
- 1901. Sir W. Hely-Hutchinson.

PRIME MINISTERS.

(A. P. H.)

Cape Elizabeth, a town of Cumberland county, Maine, U.S.A., situated in the south-western part of the state, adjoining Portland, and on the Boston and Maine railway. In 1895 it was subdivided, and a part of it chartered as the city of South Portland. Population (1880), 5302; (1890), 5459.

Cape Town, the capital of Cape Colony, on the south shore of Table Bay, between the sea and Table Mountain. It stands on a site at first almost flat, then of moderate ascent, and finally with steep slope as the mountain and its spurs are approached. It is almost completely hemmed in on the west by the Lion's Head and Rump, and less completely so on the east by the Devil's Peak. Since 1875 the town has been modernized. The "stoeps" have been cleared away, and continuous foot pavements put in their place; the streets have been levelled up and paved or well macadamized, and an underground drainage and sewage system is now approaching completion. As the supply of water from the Molteno Reservoir at the foot of Table Mountain was found insufficient for the increasing needs of the town, another reservoir, with a capacity of several hundred million gallons, has been constructed on the top of the mountain. The town is lighted with gas and electric light, water falling from the mountain to the Molteno Reservoir supplying the motive power for the

production of the latter. The old flat-roofed style of architecture is being gradually eliminated, and fine structures of modern design are rising in every part. The most noteworthy streets from the architectural point of view are Adderley Street, the fashionable business quarter, in which stand the Railway Station, the new General Post-Office, and the Standard Bank; and Queen Victoria Street, looking into the Gardens, in which are the City Club, the New Supreme Courts, the Art School, the Huguenot Memorial Hall, and, at a later date, the University Buildings. At present there are no University buildings, but a site and a large sum of money for building have been bequeathed to the University. The Parliament Houses have been completed, but a new and worthier Anglican cathedral is still a *desideratum*. Of the other public buildings, apart from those noticed in *Ency. Brit.*, ninth edition, there are the South African College, with antiquated buildings except for the modern chemical and physical laboratories; the South African Museum, a well-equipped modern building in the centre of the Botanical Gardens, quite apart from the Public Library; and the Good Hope Seminary for Girls. The suburbs of Cape Town, for natural beauty of position, are among the finest in the world. On the west they extend for about three miles, by Green Point to Sea Point, between the sea and the foot of the Lion's Rump; on the east they run round the foot of the Devil's Peak, by Woodstock, Mowbray, Rondebosch, Claremont, &c., to Wynberg, a distance of 7 miles. Though these are managed by various municipalities, there is practically no break in the buildings for the whole ten miles. All the parts are connected by the suburban railway service, and by an electric tramway system. A branch of the tramway is in process of construction over the "nek" between Table Mountain and the Lion's Head, to Camp's Bay, on the west coast, and a branch of the railway is being constructed from Cape Town round the head of Table Bay towards Blaauwberg, with a view to the laying out of a new marine suburb. Trade has considerably increased in Cape Town, though it is still smaller than that of Port Elizabeth. In 1899 the goods landed amounted in value to about 5½ millions sterling. The exports cannot well be compared with those from other ports, as they include the diamonds and bar gold from the whole of South Africa. In 1899 the total was over £11,000,000. In 1891 the population of Cape Town proper was 51,251, almost equally divided between white and coloured. The population of the whole Cape peninsula at the same date was about 100,000, the balance, also equally divided, being found mostly in the Cape Town suburbs. (R. M'W.)

Cape Verde Islands, The, on the West African coast, between 17° 13' and 14° 47' N. lat., and 22° 45' and 26° 22' W. long., consisting of fourteen islands and islets, all belonging to Portugal. Area, 1475 square miles; population (1896), 139,796. The principal product of the soil is coffee, cultivated chiefly on the islands of Santo Antão, Fogo, and São Thiago. The physic nut (*Jatropha curcas*) grows abundantly and well, also the sugar-cane, millet, and vegetables. Excellent oranges are grown. Every variety of live stock is kept, especially cattle, on São Thiago, Fogo, and Boa Vista. The principal industries, apart from agriculture, are the manufacture of sugar, spirits, salt, cottons, straw hats, and fish-curing. The total exports amounted in 1896 to a value of £85,800, and the imports (including £198,200 for coal for passing steamboats) to £354,670. The most important of the exports were coffee (£39,100), physic-tree seed (£20,450), millet (£17,100), sugar, spirits, salt, live animals, skins, and fish. This trade is principally carried on with Lisbon and the Portuguese posses-

sions on the west coast of Africa, and with passing vessels. The imports consist principally of textiles (£43,350), food-stuffs (£23,100), wine, metals, tobacco, machinery, pottery, vegetables, &c. In 1899 the ports of the archipelago were entered by a total of 3225 vessels of 3,548,065 tons. The coal, for passing steamboats, was imported in 106 steamers with 326,577 tons cargo. The total imports in the same year were £345,111, and the exports £47,777.

Capernaum, on the shore of the Sea of Galilee. The site has been placed at Tell Húm, where are the ruins of a synagogue, now the property of the Franciscans, and extensive remains; at Khan Minyeh; and at et-Tabgha. At Kerázeh, 3 miles north of Tell Húm, are the ruins of Chorazin.

Capital Punishment.—By this term is meant the infliction of the penalty of death for crime under the sentence of some properly constituted authority, as distinguished from killing the offender as a matter of self-defence or private vengeance, or his execution under the order of some self-constituted or irregular tribunal unknown to the law, such as that of the Vigilantes of California, or of lynch law as practised in the Southern and Western of the United States. In the early stages of society man-slayers were killed by the avengers of blood on behalf of the family of the man killed, and *History.* not as representing the authority of the State. This mode of dealing with homicide survives in the vendetta of Corsica and of the Mainotes in Greece, and in certain of the Southern States of North America. The obligation or inclination to take vengeance depends on the fact of homicide, and not on the circumstances in which it was committed, *i.e.*, it is a part of the *lex talionis*. The mischief of this system was alleviated under the Levitical law by the creation of cities of refuge, and in Greece and Italy, both in Pagan and Christian times, by the recognition of the right of sanctuary in temples and churches. A second mode of dealing with homicide was that known to early Teutonic and early Celtic law, where the relatives of the deceased, instead of the life of the slayer, received the *werg* of the deceased, *i.e.*, a payment in proportion to the rank of the slain, and the king received the blood-wite for the loss of his man. But even under this system certain crimes were in Anglo-Saxon law *bot-less*, *i.e.*, no compensation could be paid, and the offender must suffer the penalty of death.

United Kingdom.—The modes of capital punishment in England under the Saxon and Danish kings were various: hanging, beheading, burning, drowning, stoning, and precipitation from rocks. The principle on which this variety depends is that where an offence was *British and foreign* such as to entitle the king to outlaw the offender, *laws and methods.* he forfeited all, life and limb, lands and goods, and that the king might take his life and choose the mode of death. William the Conqueror would not permit judgment of death to be executed, and substituted mutilation; but his successors varied somewhat in their policy as to capital punishment, and by the 13th century the penalty of death became by usage (without legislation) the usual punishment for high and petty treason and for all felonies (except mayhem and petty larceny, *i.e.*, theft of property worth less than 1s.). It therefore included all the more serious form of offences against person or property, such as murder, manslaughter, arson, highway robbery, burglary (or hamesucken), and larceny; and when statutory felonies were created they were also punishable by death unless the statute otherwise provided. The death penalty was also extended to heretics under the writ *de heretico comburendo*, which was lawfully issuable under statute

from 1382 (5 Ric. II. stat. 5) until 1677 (29 Chas. II. c. 9). For this purpose the legislature had adopted the civil law of the Roman empire, which was not a part of the English common law (Stephen, *Hist. Cr. Law*, 438-469).

The severity of barbarian and feudal laws was mitigated, so far as common-law offences were concerned, by the influence of the Church as the inheritor of Christian traditions and Roman jurisprudence. The Roman law under the empire did not allow the execution of citizens except *Lex Porcia*. But the right of the emperors to legislate *per rescriptum principis* enabled them to disregard the ordinary law when so disposed. The 83rd novel of Justinian provided that criminal causes against clerics should be tried by the judges, and that the convicted cleric should be degraded by his bishop before his condemnation by the secular power, and others of the novel gave the bishops considerable influence, if not authority, over the lay judiciary. In Western Europe the right given by Imperial legislation in the Eastern empire was utilized by the Papacy to claim privilege of clergy, *i.e.*, that clerks must be remitted to the bishop for canonical punishment, and not subjected to civil condemnation at all. The history of benefit of clergy is given in Pollock and Maitland, *Hist. English Law*, vol. i. pp. 424-440, and Stephen, *Hist. Cr. Law*, 463. By degrees the privilege was extended not only to persons who could prove ordination or show a genuine tonsure, but all persons who had sufficient learning to be able to read the neck-verse (Ps. li. v. 1). Before the Reformation the ecclesiastical courts had ceased to take any effective action with respect to clerks accused of offences against the king's laws; and by the time of Henry VII. for the old process of compurgation in use in these courts was substituted burning on the hands under the order of the king's judges.

The effect of the claim of benefit of clergy is said to have been to increase the number of convictions, though it mitigated the punishment; and it became, in fact, a means of showing mercy to certain classes of individuals convicted of crime as a kind of privilege to the educated, *i.e.*, to all clerks whether secular or religious (25 Edw. III. stat. 3); and it was allowed only in case of a first conviction, except in the case of clerks who could produce their letters of orders or a certificate of ordination. To prevent a second claim it was the practice to brand murderers with the letter M, and other felons with the Tyburn T, and Ben Jonson was in 1590 so marked for manslaughter.

The times of Henry VIII. were marked by extreme severity in the execution of criminals. After the formation of English settlements in America the severity of the law was mitigated by the practice of reprieving persons sentenced to death on condition of their consenting to transportation to the American colonies, and entering into bond service there. The practice seems to have been borrowed from Spain, and to have been begun at the end of the 16th century (39 Eliz. c. 4). It was in full force immediately after the Restoration, and is recognized in the Habeas Corpus Act of 1677, and was applied by Cromwell after his campaign in Ireland, and to the Cameronians during Claverhouse's campaign in south-west Scotland. In the 18th century the courts were empowered to sentence felons to transportation instead of to execution, and this state of the law continued until 1857 (6 *Law Quarterly Review*, p. 388). The power to sentence to transportation applied only to felonies with benefit of clergy; and in 1705, on the abolition of the necessity of proving capacity to read, all criminals alike became entitled to the benefit previously reserved to clerks. Benefit of clergy was finally abolished in 1827 as to all persons not having privilege of peerage, and in 1841 as to peers and peeresses.

By this time its beneficial effect had been exhausted, since no clergyable offences remained capital crimes.

At the end of the 18th century the criminal law of all Europe was ferocious and indiscriminating by its administration of capital punishment for almost all forms of grave crime; and yet owing to poverty, social conditions, and the inefficiency of the police, such forms of crime were far more numerous than they now are. The policy and righteousness of the English law were questioned as early as 1766 by Goldsmith through the mouth of the vicar of Wakefield: "Nor can I avoid even questioning the validity of that right which social combinations have assumed of capital punishing offences of a slight nature. In cases of murder their right is obvious, as it is the duty of us all from the law of self-defence to cut off that man who has shown a disregard for the life of another. Against such all nature rises in arms; but it is not so against him who steals my property." He adds later: "When by indiscriminate penal laws the nation beholds the same punishment affixed to dissimilar degrees of guilt, the people are led to lose all sense of distinction in the crime, and this distinction is the bulwark of all morality."

The opinion expressed by Goldsmith was strongly supported by Bentham, Romilly, Basil Montagu, and Mackintosh in England, and resulted in considerable mitigation of the severity of the law. In 1819 about 180 crimes were capital. As the result of the labour of these eminent men and their disciples, and of Sir Robert Peel, there are now only four crimes capital punishable in England,—high treason, murder, piracy with violence, and destruction of public arsenals and dockyards (12 Geo. III. c. 24). An attempt to abolish the death penalty for this last offence was made in 1837, but failed, and has not since been renewed. In the case of the last two offences sentence of death need not be pronounced, but may be recorded (4 Geo. IV. c. 48). High treason is rarely prosecuted as such, but dealt with as treason felony, and since 1838 sentence of death has in practice been executed only for murder.

The change in the severity of the law is best illustrated by the following statistics:—

Years.	Death Sentences.		Sentences Executed.	
	For all Crimes.	For Murder.	For all Crimes.	For Murder.
1831	1601	14	52	12
1833 ¹	931	9	33	6
1838 ¹	116	25	6	5
1862 ¹	29	28	15	15

During the twenty years from 1879 to 1898, 1278 persons were committed for trial in England for murder, being an average of 64. The highest number was in 1884 (79), and the lowest in 1892 (50).

Of those tried in 1898, 27 were convicted, 11 were executed (all males), 15 had their sentence commuted to penal servitude for life.

The judicial statistics do not show whether any persons charged with murder were convicted of manslaughter.

Twenty persons charged with murder were sent to Broadmoor as criminal lunatics. Of these 5 were found insane on arraignment, 11 were found guilty, but insane, and 4 were certified insane by the Home Office before or after trial. It is difficult to reconcile these figures with those of the convictions, except by supposing that the persons found guilty, but insane, are not included in the convictions.

The common-law method of punishing male traitors was ferocious in the extreme. According to Walcott's case (1696) 1 *Eng. Rep.* p. 89, the proper sentence was "quod . . . ibidem super bigam (herdillum) ponatur et abinde usque ad furcas de [Tyburn] trahatur, et ibidem per collum suspendatur et vivus ad terram prosternatur et quod secreta

¹ Each of these years followed upon legislation mitigating severity of punishment.

membra ejus amputentur, et interiora sua intra ventrem suum capiantur et in ignem ponantur et ibidem *ipso vivente* comburantur, et quod caput ejus amputetur, quodque corpus ejus in quatuor partes dividatur et illo ponantur ubi dominus rex eas assignare voluit." There is a tradition that Harrison the regicide after being disembowelled rose and boxed the ears of the executioner.

In Townley's case (18 Howell, *State Trials*, 350, 351), there is a ghastly account of the mode of executing the sentence; and in that case the executioner cut the traitor's throat. In the case of the Cato Street conspiracy (1820, 33 Howell, *State Trials*, 1566), after the traitors had been hanged their heads were cut off by a man in a mask whose dexterity led to the belief that he was a surgeon.

Female traitors were until 1790 liable to be drawn to execution and burnt alive. In that year hanging was substituted for burning (30 Geo. III. c. 48).

In 1814, so much of the sentence as related to disembowelling and burning the bowels was abolished (54 Geo. III. c. 146), and the king was empowered to substitute decapitation for hanging. But it was not till 1870 that the portions of the sentence as to drawing and quartering were abolished (33 and 34 Vict. c. 23, § 31).

The mode of executing male offenders other than traitors has in England almost always been by hanging. The more primitive modes of carrying out the sentence were gradually disused, and the present system of hanging by use of the drop is said to have been inaugurated by the exertions of Earl Ferrers. The form of scaffold now in use has under the gallows a drop constructed on the principle of the trap-doors on a theatrical stage, upon which the convict is placed under the gallows, a white cap is placed over his head, and when the halter has been properly adjusted the drop is withdrawn by a mechanical contrivance, and the convict falls to a distance calculated to fracture the cervical vertebræ, the noose tightening so as to stop respiration, and the convict hangs until life is extinct.

It was until quite lately considered essential that executions, like trials, should be public, and be carried out in a manner calculated to impress evil-doers. Partly to this idea, partly to notions of revenge and temporal punishment of sin, is probably due the rigour of the administration of the English law. But the methods of execution were unseemly, as delineated in Hogarth's print of the execution of the idle apprentice, and were ineffectual in reducing the bulk of crime, which was augmented by the inefficiency of the police and the uncertainty and severity of the law, which rendered persons tempted to commit crime either reckless or confident of escape. The scandals attending public executions led to an attempt to alter the law in 1841, although many protests had been made long before, among them those of the novelist Fielding. But perhaps the most forcible and effectual was that of Charles Dickens in his letters to the *Times* written after mixing in the crowd gathered to witness the execution of the Mannings at Horsemonger Lane Gaol in 1849. After his experiences he came to the conclusion that public executions attracted the depraved and those affected by morbid curiosity; and that the spectacle had neither the solemnity nor the salutary effect which should attend the execution of public justice. His views were strongly resisted in some quarters; and it was not until 1868 (31 and 32 Vict. c. 24) that they were accepted, and executions for murder conducted in private in England. Under that Act (which was adopted from similar legislation already in force in the Australian colonies) convicted murderers are hanged within the walls of a prison. As a general rule the sentence is carried out at 8 A.M. on a week-day (not being Monday), in the

week following the third Sunday after sentence was passed. The persons required to be present are the sheriff, the gaoler, chaplain, and surgeon of the prison, and such other officers of the prison as the sheriff requires; justices of the peace for the jurisdiction to which the prison belongs, and such of the relatives, or such other persons as the sheriff or visiting justices allow, may also attend. It is usual to allow the attendance of some representatives of the Press. The death of the prisoner is certified by the prison surgeon, and a declaration that judgment of death has been executed is signed by the sheriff. An inquest is then held on the body by the coroner for the jurisdiction and a jury from which prison officers are excluded. The certificate and declaration, and a duplicate of the coroner's inquiry also, are sent to the Home Office, or in Ireland to the Lord-Lieutenant, and the body of the prisoner is interred in quicklime within the prison walls if space is available. It is also the practice to hoist a black flag on the prison at the moment of execution, and to display it for an hour, and to toll the prison bell, or the bell of a neighbouring church, for fifteen minutes before and fifteen minutes after the execution.

These regulations apply only to executions for murder; but since the passing of the Act there have been no executions for any other crime within the United Kingdom.

In Scotland capital punishment can be imposed only for treason, murder, and offences against 10 Geo. IV. c. 38, *i.e.*, wilful shooting, stabbing, strangling, or throwing corrosives with intent to murder, maim, disfigure, disable, or do grievous bodily harm, in all cases where if death had ensued the offence would have been murder. Prior to 1887 rape, robbery, wilful fire-raising, and incest, and many other crimes, were also capital offences; but in practice the pains of law were restricted at the instance of the prosecution. The sentence is carried out by hanging. It is accomplished under the supervision of the magistrates of the burgh in which it is decreed to take place; and in lieu of the inquest necessary in England and Ireland an inquiry is held at the instance of the procurator-fiscal before a sheriff or sheriff-substitute.

In Ireland capital punishment can be imposed for the same offences as in England, except offences under the Dockyards Protection Act, 1772 (12 Geo. III. c. 24), and it is carried out in the same manner.

Offences under Military Law.—Thus far only crimes against the ordinary law of the land have been dealt with. But both the Naval Discipline Act of 1866 and the Army Act empower courts-martial to pass sentence for a number of offences against military and naval laws. Such sentences are rarely if ever passed where an ordinary court is within reach, or except in time of war. The offences extend from traitorous communication with the enemy and cowardice on the field to falling asleep while acting as a sentinel on active service.

British Colonies and Possessions.—Under the Indian Penal Code sentence of death may be passed for waging war against the king (§ 121) and for murder (§ 302). If the murder is committed by a man under sentence of transportation for life the death penalty must be imposed (§ 303). In other cases it is alternative. This code has been in substance adopted in Ceylon, the Straits Settlements, and Hong-Kong, and in the Sudan. In most of the British colonies and possessions the death penalty may be imposed only in the case of high treason, wilful murder, piracy with violence. But in New South Wales and Victoria sentence of death may be passed for rape and criminal abuse of girls under ten. In Queensland the law was the same until the passing of the Criminal Code of 1899.

Throughout British South Africa the criminal law is S. II. — 73

based on the Roman-Dutch law, and not on the English common law. Capital punishment is there lawful for treason (*crimen perduellionis* or *læsæ majestatis*), murder and rape (van Leeuwen, c. 36). Though the Roman-Dutch modes of executing the sentence by decapitation or breaking on the wheel have not been formally abolished, in practice the sentence is executed by hanging. The Roman-Dutch law as to crime and punishments has been superseded in Ceylon and British Guiana by ordinances based on the English system. Under the Canadian Criminal Code of 1892 the death sentence may be imposed for treason (§ 657), murder (§ 231), rape (§ 267), piracy with violence (§ 127), and upon subjects of a friendly power who levy war on the king in Canada (§ 68). But the judge is bound by statute to report on all death sentences, and the date of execution is fixed so as to give time for considering the report. The sentence is executed by hanging within a prison, and under conditions very similar to those in England (§§ 936-945).

Austria-Hungary.—Under the Austrian Penal Code sentence of death may be passed, *inter alia*, for the graver forms of high treason, for murder, robbery with violence causing death, incendiarism or damage to trains, steamers, &c., causing death. The sentence is carried out by public hanging, supplemented, if ineffectual, by the hands of the executioner. It is very rarely executed. The criminal law of Hungary embodied in a code of 1885 has not abolished capital punishment.

Belgium.—Under the Belgian Penal Code of 1867 the death penalty is retained for certain forms of high treason, and for assassination and parricide by poisoning. It may not be pronounced on a person under 18. The sentence is executed publicly by the guillotine. But no execution seems to have taken place since 1863.

Denmark.—Sentence of death used to be executed by the axe; the guillotine is now used.

Finland.—In Finland the death penalty is alleged not to have been inflicted since 1824; and it is said to have been abolished in 1826.

France.—Under the *ancien régime* in France, 115 crimes had become capital in 1789. The mode of execution varied, but in some cases it was effected by breaking on the wheel or burning, and was coupled with mutilation. Under the Penal Code of 1810, as amended in or after 1832, even so late as 1871, thirty offences were capital, one being perjury against a prisoner resulting in his condemnation to death (art. 361). But juries freely exercise the power of acquitting in capital cases, or of defeating the capital sentence by finding extenuating circumstances in more than seven-eighths of the cases, which compels the court to reduce the punishment by one or more degrees, *i.e.*, below the penalty of death. The sentence is executed in public by decapitation by the guillotine.

Germany.—In many of the states of Germany capital punishment had been abolished (Brunswick, Coburg, Nassau, Oldenburg in 1849; Saxe-Meiningen, Saxe-Weimar, 1862; Baden, 1863; Saxony, 1868). But it has been restored by the Imperial Criminal Code of 1872, in the case of attempts on the life of the emperor, or of the sovereign of any federal state in which the offender happens to be (§ 80), and for deliberate homicide (§ 211). The various states are allowed to choose their own instruments of death. In the old provinces of Prussia it is the axe. In Rhenish Prussia and the kingdom of Saxony the guillotine is used. Executions were public till 1851, but they are now conducted privately within the prison walls in the presence of certain specified persons.

Holland.—In Holland there have been no executions since 1860. The death penalty was abolished in 1870, and was not reintroduced in the Penal Code of 1886.

The mode of execution used to be by hanging, as in England.

Italy.—Capital punishment was abolished in Tuscany as far back as 1786, and from Italy has come the chief opposition to the death penalty originated by Beccaria, and supported by many eminent jurists. Under the Penal Code of 1888 the death penalty was abrogated for all crimes, even for regicide. The cases of homicide in Italy are very numerous compared with those in England; but there are no statistics available to show any connexion between this fact and the abolition of capital punishment.

Japan.—The penalty of death is executed by hanging within a prison. It may be imposed for executing or contriving acts of violence against the Mikado or certain of his family, and for seditious violence with the object of seizing the territory or subverting the government or laws of Japan, or conspiring with foreign Powers to commence hostilities against Japan. It is inflicted for certain forms of homicide, substantially wilful murder in the first degree.

Norway.—Under Norwegian law sentence of death may be passed for murder with premeditation. But the court may as an alternative decree penal servitude for life. Sentence of death must be passed in cases where a person under sentence of penal servitude for life commits murder or culpable homicide, or causes bodily injuries in circumstances warranting a sentence of penal servitude for life, or commits robbery or the grave forms of wilful fire-raising. The sentence is carried out by decapitation; but there has been no execution since 1876.

Portugal.—There has been considerable objection in Portugal to capital punishment, and it is said to have been abolished in 1867. No one has been executed since 1846.

Rumania.—Capital punishment was abolished in Rumania in 1864.

Russia.—In 1750 under the Empress Elizabeth capital punishment was abolished; but it has since been restored, and is certainly inflicted for forms of high treason and attempts against the royal family, and breaking the quarantine laws for keeping out plague. It is difficult to ascertain whether it applies to other forms of crime; but it would seem that persons are put to death for some of the grave forms of homicide. The sentence is executed by shooting, beheading, or hanging.

Spain.—Under the Spanish Penal Code of 1870 the following crimes are capital: inducing a foreign power to declare war against Spain, killing the sovereign, parricide, and assassination. The sentence is executed in public. The criminal is conducted to the scaffold on horseback or in a cart, wearing a black tunic. A procession of priests, &c., attends him. He is seated on a scaffold and executed by the garrotte, *i.e.*, he is fastened to an upright post by an iron collar, and a knob worked by a screw or lever dislocates his spinal column, or a small blade severs the spinal column at the base of the brain.

Sweden.—The severity of the law in Sweden was greatly mitigated so far back as 1777. Under the present law the penalty of death may be imposed for certain forms of treason, including attempts on the life of the sovereign or on the independence of Sweden, or its union with Norway, and for premeditated homicide (*assassinat*), and in certain cases for offences committed by persons under sentence of imprisonment for life. Under a royal decree of 1877 it is executed by decapitation within the walls of a prison in the presence of certain officials and, if desired, of representatives of the commune in which the prison is situate. It is rarely executed, but in 1901 a man was beheaded for running amuck on a steamboat and killing and wounding a dozen people, and in 1901 a Bill to abolish capital punishment was rejected by both Houses of the Swedish Parliament.

Switzerland.—Capital punishment was abolished in Switzerland in 1874 by Federal legislation; but in 1879, in consequence of a plebiscite, each canton was empowered to restore the death penalty for offences in its territory. The Federal Government was unwilling to take this course, but was impelled to it by the fact that, between 1874 and 1879, cases of premeditated murder had considerably increased. Seven of the cantons out of twenty-two have exercised the power given to restore capital punishment. But there do not seem to have been any cases in which the death penalty was inflicted; and on the assassination of the empress of Austria at Geneva it was found that the laws of the canton did not permit the execution of the assassin.

United States of America.—Under the Federal laws sentence of death may be passed for treason against the United States and for piracy and for murder within the Federal jurisdiction. But for the most part the punishment of crime is regulated by the laws of the constituent states of the Union.

The death penalty was abolished in Michigan in 1846 except for treason, and wholly in Wisconsin in 1853. In Maine it was abolished and subsequently re-enacted, but again abolished in 1887. In Rhode Island it was abolished in 1852, but restored in 1882, only in case of murder committed by a person under sentence of imprisonment for life. In all the other states the death penalty may still be inflicted: in Alabama, Delaware, Georgia, Maryland, and West Virginia, for treason, murder, arson, and rape; in Alaska, Arizona, Kansas, New Jersey, Mississippi, Montana, New York, North Dakota, Oregon, and South Dakota for treason and murder; in Colorado, Idaho, Illinois, Iowa, Massachusetts, Minnesota, Nebraska, New Hampshire, New Mexico, Nevada, Ohio, Oklahoma, Pennsylvania, Utah, and Wyoming for murder only; in Kentucky and Virginia for treason, murder, and rape; in Vermont for treason, murder, and arson; in Indiana for treason, murder, and arson if death result; in California for treason, murder, and train wrecking; in North Carolina for murder, rape, arson, and burglary; in Florida, Missouri, South Carolina, Tennessee, and Texas for murder and rape; in Arkansas and Louisiana for treason, murder, rape, and administering poison or use of dangerous weapons with intent to murder. Louisiana is cited by Girardin (*le droit de punir*) as a state in which the death penalty was abolished in 1830. Under the influence of the eminent jurist, Livingston, who framed the state codes, the legislature certainly passed a resolution against capital punishment. But since as early as 1846 it has been there lawful, subject to a power given to the jury, to bring in a verdict of guilty, "but no capital punishment," which had the effect of imposing a sentence of hard labour for life. In certain other states the jury has under local legislation the right to award the sentence. The constitutionality of such legislation has been doubted, but has been recognized by the courts of Illinois and Iowa. Sentence of death is executed by hanging by the neck except in New York and Ohio, where it is carried out by "electrocution," or by passing through the body of the convict a current of electricity of sufficient intensity to cause death and until death is caused. The execution is carried out privately in a specified prison, only certain specified persons or classes of persons are allowed to be present, and no coroner's inquest is held (Ohio Stat., §§ 7338-7344, New York State Laws of 1888, c. 489). The validity of the New York law was attacked, largely on the ground that the method of death which was prescribed under it was a "cruel and unusual punishment" and therefore contrary to one of the clauses of the Constitution of the United States; but the constitutionality of

the law was finally upheld both in the state and Federal courts. Through the United States as a whole public opinion is certainly not against capital punishment.

With the mitigation of the law as to punishment the agitations against capital punishment have lost their force. But many Continental and American writers, and some English writers and associations, advocate the total abolition of the death punishment. *The question of abolition.* Émile de Girardin, writing against all forms of punishment, said that he would abolish that of death last as being the least cruel and the most effectual. The ultimate argument of the opponents is that society has no right to take the life of any one of its members on any ground. But they also object to capital punishment: (1) on religious grounds, because it may deprive the sinner of his full time for repentance; (2) on medical grounds, because homicide is usually if not always evidence of mental disease or irresponsibility; (3) on utilitarian grounds, because capital punishment is not really deterrent, and is actually inflicted in so few instances for murder that criminals discount the risks of undergoing it; (4) on legal grounds, *i.e.*, that the sentence being irrevocable and the evidence often circumstantial only, there is great risk of gross injustice in executing a person convicted of murder; (5) on moral grounds, that the punishment does not fit the case nor carry out the true function of punishment, namely, the reformation of the offender.

The punishment is probably retained, partly from ingrained habit, partly from a sense of its appropriateness for certain crimes, but also that the *ultima ratio* may be available in cases of sufficient gravity to the commonweal. The apparent discrepancy between the number of trials and convictions for murder is not in England any evidence of hostility on the part of juries to capital punishment, which has on the whole lessened rather than increased since the middle of the 19th century. It is rarely if ever necessary in England, though common in America, to question the jurors as to their views on capital punishment. The reasons for the comparatively small number of convictions for murder seem to be: (1) that court and jury in a capital case lean *in favorem vitæ*, and if the offence falls short of the full gravity of murder, conviction for manslaughter only results; (2) that in the absence of a statutory classification of the degrees of murder, the prerogative of mercy is exercised in cases falling short of the highest degree of gravity as recognized by lawyers and public opinion; (3) that where the conviction rests on circumstantial evidence the sentence is not executed unless the circumstantial evidence is conclusive; (4) that charges of infanticide against the mothers of illegitimate children are treated mercifully by judge and jury, and usually terminate in acquittal, or in a conviction of concealment of birth; (5) that many persons tried as murderers are obviously insane; (6) that coroners' juries are somewhat recklessly free in returning inquisitions of murder without any evidence which would warrant the trial of the person accused.

The medical doctrine, and that of Lombroso with respect to criminal atavism and irresponsibility have probably tended to incline the public mind in favour of capital punishment, and Sir James Stephen and other eminent jurists have even been thereby tempted to advocate the execution of habitual criminals. It certainly seems strange that the community should feel bound carefully to preserve and tend a class of dangerous lunatics, and to give them, as Charles Kingsley says, "the finest air in England and the right to kill two gaolers a week."

The whole question of capital punishment was considered by a royal commission appointed in 1864, which

reported in 1866 (Parl. Pap. 1866, 10,438). The commission took the opinions of all the judges of the supreme courts in the United Kingdom and of many other eminent persons, and collected the laws of other countries so far as this was ascertainable. The commissioners differed on the question of the expediency of abolishing or retaining capital punishment, and did not report thereon. But they recommended: (1) that it should be restricted throughout the United Kingdom to high treason and murder; (2) alteration of the law of homicide so as to classify homicides according to their gravity, and to confine capital punishment to murder in the first degree; (3) modification of the law as to child murder so as to punish certain cases of infanticide as misdemeanours; (4) authorizing judges to direct sentence of death to be recorded; (5) the abolition of public executions.

Of these suggestions Parliament has carried out only the last, from which the commissioners averse from capital punishment dissented; and it is improbable that the question will again assume any importance until a criminal code is introduced. At the present time, when a trial for murder takes place, there is frequently a good deal of newspaper agitation for reprieve of the prisoner. But this is usually dictated more by desire to re-try the case in the Press, and to criticize the evidence or the tribunal, than to advocate the theories of absolute opponents to capital punishment.

Capitanata, the former name, down to 1871, of the Italian province of Foggia.

Capiz, the capital of the province of the same name in the Island of Panay, Philippine Islands. It is some five miles from the north coast, on a river of sufficient depth to admit small steamers. It is a healthful, although rather hot, town, with good government buildings. Alcohol is manufactured in large quantities from the fermented juice of the nipa palm, which grows plentifully in the neighbouring swamps. Rice and sugar are raised in abundance. Tobacco, Indian corn, and cacao are produced to a limited extent. Fishing, and the weaving of fabrics of cotton, hemp, and pine-apple fibre are important industries. The language is Visayan. Population, 25,000.

Capo d'Istria, a fortified seaport town of Austria, in the margraviate of Istria. In addition to the production of salt, its principal industries are weaving, dyeing, and shipbuilding. Trade is chiefly in sea-salt, wine, and oil. It is also a sea-bathing resort. Population (1890), 10,706; (1900), 10,711, mostly Italian.

Capri, an island of the province of Naples, Campania, Italy, at the S. entrance of the Gulf of Naples. It is visited by some 30,000 strangers every summer, whilst many German and other artists stay there all the year round. The air is pure, the winter mean being 50° Fahr. The island is also famous for its wine. Since 1874 there has been a driving-road up to Anacapri (pop. 2500). Population of Capri, the chief town, 3700; of the entire island, about 6500.

Caprivi de Caprera de Montecucoli, Georg Leo von, Count (1831-1899), German soldier and statesman, was born 24th February 1831 at Charlottenburg. The family springs from

Carniola, and the name was originally written Kopriva; in the 18th century one branch settled in Wernigerode, and several members entered the Prussian service; the father of the Chancellor held a high judicial post, and was made a life member of the Prussian House of Lords. Caprivi was educated in Berlin, and entered the army in 1849; he took part in the campaign of 1866, being attached to the staff of the 1st army. In 1870 he served as chief of the staff to the 10th army corps, which formed part of the 2nd army, and took part in the battles before Metz as well as in those round Orleans, in which he highly distinguished himself. After the peace he held several important military offices, and in 1883 was made Chief of the Admiralty, in which post he had to command the fleet and to organize and represent the department in the Reichstag. He resigned in 1888, when the command was separated from the representation in Parliament, and was appointed commander of the 10th army corps. Bismarck had already referred to him as a possible successor to himself, for Caprivi had shown great administrative ability, and was unconnected with any political party; and in March 1890 he was appointed Chancellor, Prussian Minister President, and Foreign Minister. He was quite unknown to the public, and the choice caused some surprise, but it was fully justified. The chief events of his administration, which lasted for four years, are narrated elsewhere, in the article on Germany. He showed great ability in quickly mastering the business, with which he was hitherto quite unacquainted, as he himself acknowledged; his speeches in the Reichstag were admirably clear, dignified, and to the point. His first achievements were the treaty with Great Britain in 1890, for which he was bitterly attacked by the colonial parties. The commercial treaties with Austria, Rumania, &c., followed; by concluding them he earned the express commendation of the Emperor and the title of Count, but he was from this time relentlessly attacked by the Agrarians, who made it a ground for their distrust that he was not himself a landed proprietor; and from this time he had to depend much on the support of the Liberals and other parties who had been formerly in opposition. The reorganization of the army caused a parliamentary crisis, but he carried it through successfully, only, however, to earn the enmity of the more old-fashioned soldiers, who would not forgive him for shortening the period of service. His position was seriously compromised by the failure in 1892 to carry an Education Bill which he had defended by saying that the question at issue was Christianity or Atheism, and he resigned the presidency of the Prussian ministry, which was then given to Count Eulenburg. In 1894 a difference arose between Eulenburg and Caprivi concerning the bill for an amendment of the Criminal Code (the *Umsturz Vorlage*), and in October the Emperor dismissed both. Caprivi's fall was probably the work of the Agrarians, but it was also due to the fact that, while he showed very high ability in conducting the business of the country, he made no attempt to secure his personal position by forming a party either in Parliament or at Court. He interpreted his position rather as a soldier; he did his duty, but did not think of defending himself. He suffered much from the attacks made on him by the followers of Bismarck, and he was closely associated with the social ostracism of that statesman; we do not know, however, in regard either to this or to the other events of his administration, to what extent Caprivi was really the author of the policy he carried out, and to what extent he was obeying the orders of the Emperor. With a loyalty which cannot be too highly praised, he always refused, even after his abrupt dismissal, to justify himself, and he could not be persuaded

even to write memoirs for later publication. The last years of his life were spent in absolute retirement, for he could not return even to the military duties which he had left with great reluctance at the orders of the Emperor. He died unmarried on 6th February 1899, at the age of sixty-eight.

See *Die Reden des Grafen v. Caprivi* (Berlin, 1893).

(J. W. HE.)

Capstan (Windlass), an appliance used on board ship and on dock walls in connexion with weighing anchor and transporting ship. Its earlier forms were of a comparatively simple character, but, as heavier cables were supplied to ships, the difficulty when riding was in holding and veering. A new cable-holder made by Mr W. H. Harfield was tried in H.M.S. *Newcastle* and proved effective; its first development was the application in the form of a windlass secured to the deck driven by means of a messenger chain from the capstan,

Fig. 1.

fitted in H.M.S. *Inflexible* (Fig. 1).

The capstans and engine are shown at A, A, A, and the windlass B is driven by messenger chains C, C. The four cables (dotted line D, D) lead to their respective cable-holders, fitted with a brake similar to that in Fig. 2, and by these means each cable-holder can be connected to the main driving shaft, and any cable hove-in or veered independently of the other; by using steam-power instead of hand- the slow motion is obviated. In H.M.S. *Collingwood* steam-power is used to work the windlass directly by means of worm gearing; the windlass is divided into two parts, so that the one on the port side can be worked independently of that on the starboard, and *vice versa*. An independent capstan in both ships, arranged to take either of the cables, can be worked by hand or steam. In the *Collingwood's* windlass, the cables remain on their holders and can be hove-in or veered without touching the chain. Fig. 2 is Harfield's frictional brake, which also acts as a connector. A is the cable-holder loose on the shaft B, C and C are a series of plates connected to the spindle by a suitable carrier, D and D another series connected to the cable-holder, and E a plate into which the bars are inserted, revolving the screw F. By means of the latter the two series of discs are pressed together, obtaining the necessary amount of friction for veering slowly or rigidly connecting; when the top plate is screwed back the cable-holder revolves freely. Fig. 3 is the gear fitted in the *Formidable* class (15,000 tons). The two cable-holders on the upper deck, A, are each fitted with a frictional brake for veering and connecting, the former being worked from below the armoured deck by steam-engine B and worm-wheel C, and the compound clutch at D enables the cables to be worked together, or separately, or simultaneously with one "heaving in" and the other veering. The middle-line capstan E, on the upper deck, is not fitted with brake gear, but will take the main cables, and, by portable whelps, wire and hempen hawsers; it can be worked by steam from engine B, through worm-wheel F, or by capstan bars G G (CAPSTAN, ninth edition). The capstans are of cast-steel, capable of taking 2½-inch cables, and can be controlled from the upper deck or engine-room. The capstan engines have cylinders of 14 inches in diameter, with a 13-inch stroke, and are designed for a steam pressure of 300 lb to the square inch. Fig. 4 shows the upper deck of the *Irresistible* (*Formidable* class) fitted by Messrs Clarke, Chapman, and Co.

Fig. 2.

The electrical capstan (Harfield), introduced in H.M. ships for stern moorings and warping, is illustrated in Fig. 5. The capstan is on the upper deck, the cable-holder A works the stern moorings, outside of which are the portable whelps B, B, for steel-wire hawsers; the capstan is driven through the worm-wheel C by the motor D, and can be disconnected by the clutch E for working

Fig. 3.

by hand. The electric motor is controlled from the upper deck by the lever F, working through the main switch G and the resistances H. This design is somewhat extravagant in electrical consumption, but a stern capstan is seldom used, even then only for a short period, and in its favour are perfect control and noiseless working, and no automatic brake is required.

In the electrical capstan (Clarke, Chapman, and Co.), the motor drives the vertical shaft of the capstan by means of a worm and worm-wheel. The gear is fitted with an electric brake actuated by a solenoid; when the current is passing in the solenoid the brake is held out of action against the force exerted by a spring, but, when the circuit is broken, the spring causes the brake to act. The contacts are in the upper portion of the resistance coil, and its controlling spindle is worked from the deck; from the off-contact point one direction of the rotation of the switch causes the motor to run in

Fig. 4.

one direction and the opposite direction reverses it. The motor will give up to about 60-horse-power. To meet the difficulty in warping when the ship remains stationary instead of moving, and when the armature of the motor would run the risk of burning owing to the rush of current, an automatic circuit-breaker is inserted in the circuit, adjusted to break at the maximum current which the machine is intended to carry. When the automatic circuit-breaker acts, it inserts a resistance in the circuit capable of taking up the whole back E.M.F. of the armature; therefore, the current through the armature remains as it would be at full load, but cannot be exceeded. By these means the torque due to this current in the armature is maintained, but the latter cannot turn until the ship moves, when it would commence to rotate and

generate back E.M.F.; on this being effected the automatic switch must be replaced and remain in place so long as the current keeps below the maximum for which it is adjusted. The speed of the motor is 380 revolutions per minute, and with this speed the lift is 15 tons, at the rate of 25 feet per minute.

All capstans for H.M. ships are tested for lifting power and speed; with foremast capstans the anchor is usually

Fig. 5.

let go in not less than 25 fathoms' water and the speed ascertained by observing the time taken to heave-in not less than a length of cable, 75 fathoms. In the mercantile marine various designs of steam windlasses are used, generally fitted with warping ends for working ropes; in case of failure of steam, hand-power with "wee-gee" motion is employed, but where a warping capstan is fitted it is worked with capstan bars. Capstans on dock walls in H.M. dockyards are usually driven by hydraulic or air pressure conveyed through pipes to small engines underneath the capstans. (J. W. D.)

Capua, a fortified garrison town and archiepiscopal see of the province of Caserta, Campania, Italy, on the river Volturno, 7 miles N.W. from Caserta by rail. The cathedral, dating originally from the 11th century, has been entirely modernized. The other buildings embrace the Campanian Museum (archæological, 1874), and a tower and mortuary chapel, commemorative of the slaughter of the inhabitants when the town was captured by Cesare Borgia in 1501. The fortifications were planned by Vauban, and extended in 1855. The manufacture of fireworks is a speciality. Bricks are also made. Population, about 14,500.

Caracal, a town in Rumania, chief town of the district of Romanati. It is a seat of a court of first instance, and has eleven churches and a school of arts and crafts. The town derives its name from the Emperor Caracalla, who, in the year 217, built a tower there, of

which the ruins are still to be seen. Population (1895), 11,000; (1900), 12,025.

Caracas, capital city of Venezuela and of the federal district, situated in 67° 4' 45" W. long. and 10° 30' N. lat., 23 miles S.S.E. of La Guaira, its port, by rail; 3018 feet above sea-level. The city, including the six outlying parishes, forms the federal district, which has an area of 45 square miles and a population of about 100,000. There are two telephone companies and two banking institutions—the bank of Venezuela, with a capital of 8,000,000 bolivars and a reserve of 974,753·39 bolivars, and the bank of Caracas, a joint-stock company with a capital of 6,000,000 bolivars and a reserve fund of 345,928 bolivars. Four railway lines start from Caracas. The line to Port La Guaira is a bold undertaking because of the height of Mount Avila and the sinuosities of the land over which it travels; but the longest line goes to Valencia and Puerto Cabello, crossing the high cordilleras surrounding Caracas, and dropping into the valleys of Aragua. Caracas is the residence of the archbishop of Venezuela, the dioceses suffragan to it being those of Ciudad Bolivar, Calabozo, Barquisimeto, Mérida, and Maracaibo. The city is lighted by both gas and electricity. Population, 72,429.

Caraman, or **KARAMAN** (*Laranda*, a name still used by the Christians), a town in the Konia vilâyet of Asia Minor, situated on the plain north of Mount Taurus. The modern name is derived from Karaman, to whom it was granted by Sultan Ala ed-Dîn of Rûm. It has few industries and little trade, but the mediæval walls and the mosques are interesting, and the old Seljûk *medresse*, or college, is one of the most beautiful buildings in Asia Minor. Population, 5000 (Moslems, 4500; Christians, 500).

Caramania, or **KARAMANIA**, formerly an independent province in the south of Asia Minor, named after Karaman, the son of an Armenian convert to Islâm, who married a daughter of the Seljûk sultan of Rûm, and was granted Laranda (Karaman), and made governor of Selefké, 1223-45. On the collapse of the Seljûk empire, Karaman's grandson, Mahmûd, 1279-1319, founded a state, with its capital at Konia, which included Pamphylia, Lycaonia, and large parts of Cilicia, Cappadocia, and Phrygia. The state was frequently at war with the kings of Lesser Armenia, the Lusignan princes of Cyprus, and the knights of Rhodes. It was also engaged in a long struggle for supremacy with the Osmanli Turks, which only ended in 1472, when it was annexed by Muhammad II. The Osmanlis divided Karamania into Kharij, north, and Ichili, south of the Taurus. The name is now often given by geographers to Ichili only.

Carapequa, an important town of Paraguay, founded in 1725. The adjacent country cultivates cotton, tobacco, corn, sugar-cane, and mandioca. It has two schools, a church, many modern edifices and business houses, a post-office, and a sub-department of the Agricultural Bank. Population, 13,000.

Carbondale, a city of Lackawanna county, Pennsylvania, U.S.A., situated in 41° 34' N. lat. and 75° 30' W. long., on Lackawanna river, a branch of the Susquehanna, in the north-eastern part of the state, at an altitude of 1080 feet. It is a coal-mining town, being situated in the midst of the anthracite coal region of the United States. It is served by three railways, the Delaware and Hudson, the Lehigh Valley, and the Delaware, Lackawanna and Western. Population (1880), 7714; (1890), 10,833; (1900), 13,536.

Carborundum. See ELECTRO-METALLURGY.

Carcar, a town situated on high ground near the east coast of Cebu, Philippine Islands, in $10^{\circ} 7' N$. It was founded in 1624. The surrounding country, though rugged, is quite fertile, and produces sugar in considerable quantity. The language is Cebu-Visayan. Population, 30,000.

Cardenas, a town and seaport in Cuba, on the north coast, in $81^{\circ} 12' W$., 76 miles E. of Havana. It was founded in 1828, is one of the few towns of Cuba built in the 19th century, and is a thriving place. It lies on a spacious bay sheltered by a long promontory. It is one of the principal sugar-exporting places of the island, and is connected by rail with Matanzas, Havana, Santa Clara, and Cienfuegos, and by the regular steamers with all the coast towns. Population, 21,940.

Cardiff, a municipal, county (1888), and parliamentary borough and seaport of England, on the Taff, 1 mile above its outfall into the estuary of the Severn, $40\frac{1}{2}$ miles W. of Bristol, $45\frac{1}{2}$ miles E.S.E. of Swansea, 170 miles by rail W. of London, capital of the principality of Wales, and chief town of the county of Glamorgan; on the Great Western railway, and in direct and manifold railway communication with the coal and mineral districts of South Wales. The borough is divided into 10 wards under a mayor, 10 aldermen, and 30 councillors. From 2624 houses in 1851, Cardiff grew to 20,476 houses in 1891 and 28,009 houses in 1901. The waterworks, purchased by the corporation in 1879, have since been extended and a new supply, from the Taff Fawr Valley, provided at a cost, up to 1897, of over £1,139,452. The corporation have laid down lines for electric tramways and built power-stations, &c. About £500,000 will be laid out on these and the purchase and equipment of the existing lines. Various other public works are being actively pushed forward. The corporation already own the electric light undertaking, which they are extending. The Great Western railway in 1899 quadrupled its lines between Cardiff and Newport, and largely extended and improved its station at Cardiff, and in 1900 opened a new station at Roath. The network of railways and sidings around the Bute Docks comprises a length of about 120 miles. An iron swing bridge, Clarence Bridge, over the Taff, connecting Grangetown with the docks, was opened in 1890. New wharves and warehouses have been erected at all the principal towns and villages along the canal between Cardiff and Merthyr-Tydfil.

The educational institutions include the University College (1883), a constituent college of the University of Wales, soon to be transferred to new buildings in Cathays Park; Schools of Science and Art (1891); the Baptist Theological College, stationary in Cardiff since 1893; a higher-grade school (1895), and many other board and national schools; 2 intermediate schools; a school of cookery (1890); a free library and museum (1882), extended and reopened (1896) at a cost of £20,000; a museum and art gallery, for which new buildings, at an estimated cost of £13,500, are to be erected in Cathays Park. Other recent public institutions are the market hall (1891); a new post-office (1898) costing £75,000; a new custom-house (1899); a new Government stamp-office (1900); baths (1896); a theatre; mining engineers' institute (1890); the infirmary, erected (1883) at a cost of over £40,000; Roath Park (120 acres), opened 1894; Ely Park; Canton Park; besides fifteen open spaces acquired since 1890. Cathays Park, in the centre of the town, 60 acres in area, was purchased in 1900 for £160,000; and, in addition, £44,000 has already been spent in laying it out. In this park, moreover, new

municipal buildings and law courts are to be erected at a cost of £233,000.

At the mouth of the three rivers—Rhymney, Taff, and Ely—within a dozen miles of the great coal and iron deposits of South Wales, comprising a coalfield estimated at 1000 square miles in area, with a storage capacity of over 30,000 million tons, 50 miles nearer London than Liverpool is, Cardiff commands unrivalled resources and an unsurpassed position as a port of trade. Accordingly, since by the construction of the canal and railways the mineral wealth of the hills has found free outlet to Cardiff, and thence, by her docks and capacious, safe, and readily accessible harbour, to all parts of the world, the export trade has grown in magnitude at a rate unexampled, till now Cardiff is the third largest exporting port of the United Kingdom and the heaviest coal-exporting port of the world, its coal shipments, 11,925,975 tons in 1898, largely exceeding those of the Tyne ports. An official estimate rates the increase of coal shipments at $7\frac{1}{2}$ per cent. per annum for the twenty-four years 1864-87, and sees no reason to doubt the continuance of the same rate of increase.

The following is a list of the Bute docks and basins, with their respective dimensions:—

Dock.	Acreage.	Dimensions.	Quayage.	Depth on Sills.
West Dock (1839)	18	4000 ft. by 200 ft.	8800 ft.	28 ft. $8\frac{1}{2}$ in. springs
„ Basin (1839)	$1\frac{1}{2}$	300 ft. by 200 ft.	..	18 ft. $8\frac{1}{2}$ in. neaps.
„ Lock	152 ft. by 36 ft.
East Dock (1855)	44	1000 ft. by 300 ft.	9860 ft.	31 ft. $8\frac{1}{2}$ in. springs.
„ Basin (1855)	$2\frac{1}{2}$	3300 ft. by 500 ft.	..	21 ft. $8\frac{1}{2}$ in. neaps.
„ Lock	..	880 ft. by 250 ft.
Roath Dock (1837)	$8\frac{1}{2}$	200 ft. by 49 ft.	7520 ft.	35 ft. 9 in. springs.
„ Basin (1874)	12	2400 ft. by 600 ft.	2700 ft.	25 ft. 9 in. neaps.
„ Lock (1887)	$1\frac{1}{2}$	1000 ft. by 550 ft.
Glam. Canal Float (1798)	..	350 ft. by 80 ft.	..	18 ft. 9 in. springs.
Glam. Canal Basin	12	600 ft. by 80 ft.	11,000 ft.	8 ft. 9 in. neaps.
„ „ „	..	5500 ft. by 100 ft.
Total Docks .	124 $\frac{3}{4}$	485 ft. by 180 ft.	..	42 ft. springs.
New South Dock .	42	2600 ft. by 650 ft.	7,460 ft.	32 ft. neaps.
„ „ Lock .	$2\frac{1}{2}$	700 ft. by 160 ft.
Grand Total .	169 $\frac{1}{2}$..	46,840 ft.	..

Graving Docks { 10 in number up to 600 feet in length and 60 feet entrance.

Timber ponds, measuring 28 acres, have also been constructed for the accommodation of the fast-growing timber trade. The South Bute Dock, still in process of construction, is on the foreshore, with a seaward embankment extending out to a line nearly opposite the mouth of the Ely river. Connecting with the Roath Dock, it will have no basin, but a lock with sea gates, and practically serve as a low-water dock. Forty-two acres in area, it will accommodate the very largest steamers, cargo or passenger. On the completion of the new dock, the Bute Docks will have a floating area, exclusive of the Glamorgan canal, of 157 acres; with the canal, float, and basin, 169 $\frac{1}{2}$ acres; and further, with the timber floats, 197 $\frac{1}{2}$ acres, an area which, apart from the other docks within the limits of the customs port, constitutes Cardiff the third port in the kingdom for extent of wet-dock accommodation. The entrance channel to the docks runs out about $1\frac{1}{2}$ miles to a point opposite Penarth Head, with a low-water pier. The depth of water at high-water springs is 43 feet, 8 inches; at low-water neaps, 15 feet. The new dock entrance lock and embankment will extend farther out in the channel, and supersede the present pier. In the entrance channel are two floating pontoons for coasting

steamboat traffic. There is also a harbour, dug out of the mud to the west of the channel, for mooring the pilot boats, and ample accommodation opposite (on east side) for the large fleet of tug boats. The Windsor Dock Company, furthermore, are seeking powers to construct a dock on the west side of Cardiff, at a cost of £825,000.

The mechanical erections at the Bute Docks include 50 coal staiths, hydraulic lifts, and cranes for loading; 57 cranes for discharging; 1 shear legs; 10 graving docks; 1 gridiron; 2 pontoons, and 2 pontoon docks. Eleven of the cranes are "Lewis-Hunter" patent coal cranes, lifting up to 30 tons; and, loading simultaneously as many hatches as a vessel may have, will in 24 hours stow as much as 7000 tons and load vessels carrying 10,000 tons.

Large warehouses and transit sheds have been erected at the West, East, and Roath Docks for housing grain, provisions, &c. One flour-mill cost £80,000. One warehouse will hold 75,000 quarters of grain. There is also extensive wharf accommodation for heavy goods such as timber and iron ore, cold storage for dead meat, and lairs for live cattle. The capital invested in these docks, including Penarth and Barry Docks, is estimated at 8 to 9 millions.

The industries of Cardiff include iron-founding; iron, steel, and copper works; flour-mills; biscuit factory; shipbuilding; tin enamel, chemical, waggon and printing works; sail-making, wire and hemp roperies, coach-building, &c. The Dowlais blast-furnaces employ about 300 men, and the steel works in full swing, 3000 men—the iron and steel works covering 82 acres. One milling firm has the capacity to supply all the flour needed by a population of 600,000.

Registered shipping in 1888, 290 vessels of 151,972 tons; in 1898, 285 of 204,018 tons; in 1899, 270 of 212,058 tons. Entered in 1888, 12,973 vessels of 5,767,616 tonnage; in 1898, 12,136 of 6,378,189 tonnage; in 1899, 11,824 of 8,837,234 tonnage. Cleared in 1888, 13,274 vessels of 6,083,762 tonnage; in 1898, 12,179 of 6,737,821 tonnage; in 1899, 11,845 of 9,003,275 tonnage. Imports of foreign and colonial merchandise in 1888 amounted to the value of £2,165,961; in 1898, £2,612,327; in 1899, £3,352,191. Exports of the produce of the United Kingdom in 1888 were valued at £4,873,106; in 1898, £5,521,350; in 1899, £8,662,147. Of the total imports in 1899, valued at £3,352,191, the most important articles were wheat, valued at £812,523; iron ore, £589,094; wood of all sorts, £1,112,289. Of the exports in 1899, valued at £8,662,147, coal, coke, cinders, and patent fuel alone amounted to £3,308,533. The import of timber in 1845 was 6965 loads; in 1855, 31,829 loads; in 1865, 103,170 loads; in 1885, 373,398 loads; in 1895, 689,871 loads. The iron-ore trade, first coastwise and then oversea, has increased thirteen times over since 1850. Cardiff publishes 4 daily, 1 bi-weekly, and 2 weekly newspapers, and has 15 banks. Area of municipal borough, 8408 acres; population (1881), 82,761; (1891), 128,915; (1901), 164,315. Area of parliamentary borough, comprising the contributory boroughs of Cardiff, Cowbridge, and Llantrisant, 12,247 acres; population (1881), 85,862; (1891), 132,229; (1901), 180,000. It has been observed that from 1841 to 1891 the population increased, roundly speaking, 10,000 for every additional million tons of coal shipped. Moreover, if to the population of the municipal borough be added that of Penarth and Barry, the total population is 205,675 (1901).

Cardigan, a municipal borough, seaport, and county town of Cardigan, extending into Pembrokeshire,

Wales, 274 miles W. by N. of London by rail, on the Teifi, 5 miles from its mouth. Since 1885 the parliamentary representation of the borough has been merged in that of the county. The old endowed grammar-school has been united with an intermediate school. In 1898 the registered shipping was 29 vessels of 1135 tons; in 1898, 415 vessels of 18,274 tons entered, and 393 of 17,401 tons cleared. Area, 4926 acres; population (1881), 3669; (1901), 3511. There is a parish of Cardigan.

Cardigan, a maritime county of South Wales, bounded on the N. by Merioneth, on the E. by Montgomery, Radnor, and Brecon, on the S. by Carmarthen and Pembroke, and on the W. by Cardigan Bay.

Area and Population.—The area of the ancient county is 440,630 acres, or 688 square miles. The population in 1881 was 70,270, and in 1891 was 62,630, of whom 27,365 were males and 35,265 females, the number of persons per square mile being 91, and of acres to a person 7.04. In 1901 the population was 60,237. The area of the administrative county is 443,071 acres, with a population in 1891 of 63,467. The area of the registration county is 595,285 acres, with a population in 1891 of 86,383. Within its area there was, between 1881 and 1891, a decrease in the population of 9.20 per cent. The excess of births over deaths between 1881 and 1891 was 6971, but the decrease in the resident population was 8754. The following table gives the numbers of marriages, births, and deaths, with the number and percentage of illegitimate births, for 1880, 1890, and 1899:—

Year.	Marriages.	Births.	Deaths.	Illegitimate Births.	
				No.	Percentage.
1880	543	2625	1882	220	8.4
1890	502	2078	1641	171	8.2
1899	506	1964	1604	141	6.1

In 1891 the number of Scots in the county was 128, of Irish 98, and of foreigners 46; while 3979 could speak English, 61,624 Welsh, and 1711 English and Welsh.

Constitution and Government.—The county returns one member to Parliament, and it has no parliamentary borough. There are three municipal boroughs, Aberystwith (8013), Cardigan (3511), and Lampeter (1722). The urban districts are Aberayron (1827) and New Quay (1234). The county is in the south-western circuit, and the assizes are held at Lampeter; the boroughs of Aberystwith and Cardigan have separate commissions of the peace, but no separate court of quarter sessions. The ancient county contains 66 entire ecclesiastical parishes and districts, and part of one other. It is entirely in the diocese of St. Davids.

Education.—At Aberystwith is a university college, in connexion with which there is a day training college for schoolmasters and mistresses. The number of elementary schools in the county on 31st August 1899 was 107, of which 75 were board and 32 voluntary schools, the latter including 27 National Church of England schools, and 5 "British and other." The average attendance at board schools was 5989, and at voluntary schools 2264. The total school board receipts for the year ending 29th September 1899 were over £19,129. The income under the Agricultural Rates Act was over £1905.

Agriculture.—About three-fifths of the total area of the county is under cultivation, and of this more than five-ninths is in permanent pasture. There are also, in addition, about 129,000 acres in hill pasture and about 16,000 acres under woods. Within the last twenty years the acreage under corn crops has decreased by about one-seventh. Wheat has only slightly decreased in acreage, and occupies about one-eighth of the corn acreage, barley occupying considerably more than one-fourth and oats considerably more than one-half. Potatoes occupy a rather larger acreage than turnips. The following table gives the larger main divisions of the cultivated area at intervals of five years from 1880:—

Year.	Total Area under Cultivation.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	276,236	61,833	13,123	44,023	155,179	2078
1885	281,478	58,792	13,671	44,854	162,951	1210

The following table gives particulars regarding the principal live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or in Calf.	Sheep.	Pigs.
1880	13,873	62,917	25,747	213,343	18,979
1885	13,991	67,299	27,010	211,462	22,218
1890	14,714	65,500	26,811	221,652	25,489
1895	16,053	65,336	25,565	221,533	24,308
1900	17,573	72,229	26,967	274,955	22,897

Industries and Trade.—According to the annual report of the inspector of factories for 1898 (1900), the number of persons engaged in all factories and workshops in 1897 was 1359, as compared with 1357 in 1896. The total number of persons employed in mines and quarries in 1899 was 682. Copper-mining is now almost extinct. The output of lead is also declining, 2072 tons, valued at £18,143, being dug in 1885, and 598 tons, valued at £5823, in 1899. Of zinc 3273 tons, valued at £8760, were obtained in 1885, and 3328 tons, valued at £14,585, in 1898, but in 1899 only 1819 tons, valued at £10,303, were got. Clay and sandstone are also raised. The total quantity of fish landed at New Quay (Cardigan), Aberayron, and Aberystwith in 1899 was 2875 cwts., valued at £2921.

Carducci, Giosue (1836—), Italian poet, was born at Val-di-Castello in Tuscany, 27th July 1836. His father was a physician, and Carducci received a good education. He began life as a public teacher, but soon took to giving private lessons at Florence, where he became connected with a set of young men, enthusiastic patriots in politics, and in literature bent on overthrowing the reigning romantic taste by a return to classical models. These aspirations have always constituted the mainstays of Carducci's poetry. In 1860 he became professor at Bologna, where, after in 1865 astonishing the public by a defiant *Hymn to Satan*, he published in 1867 *Levia Gravia*, a volume of lyrics which not only gave him an indisputable position at the head of contemporary Italian poets, but made him the head of a school of which the best Italian men of letters have been disciples, and which has influenced all. Several other volumes succeeded, the most important of which were the *Decennalia* (1870), the *Nuove Poesie* (1873), and the three series of the *Odi Barbare* (1877-89). The employment of the antique metrical forms in these has occasioned fierce literary controversies, hardly yet allayed. It is not likely that Carducci's example will be largely imitated, for the excellent reason that it is incapable of imitation except by a consummate metrist, but its indirect inculcation of a robust and manly style has been of the highest value. Rallied to the Savoy dynasty, Carducci enjoys the dignity of a senator of the Italian kingdom, and occupies a position of authority as citizen as well as writer.

Cardwell, Edward Cardwell, VISCOUNT (1813-1886), English statesman, was the son of a merchant of Liverpool, where he was born on 24th July 1813. After a brilliant career at Oxford, where he gained a double first-class, he entered Parliament as member for Clitheroe in 1842, and in 1845 was made secretary to the Treasury. He supported Sir Robert Peel's free-trade policy, and went out of office with him. In 1847 he was elected for Liverpool, but lost his seat in 1852 for having supported the repeal of the navigation laws. He soon found another constituency at Oxford, and upon the formation of Lord Aberdeen's coalition ministry in 1853 became president of the Board of Trade, although debarred by the jealousy of his Whig colleagues from a seat in the Cabinet. In 1854 he carried, almost without opposition, a most important and compli-

cated act consolidating all existing shipping laws, but in 1855 resigned, with his Peelite colleagues, upon the appointment of Mr Roebuck's Sebastopol inquiry committee, declining the offer of the chancellorship of the Exchequer pressed upon him by Lord Palmerston. In 1858 he moved the famous resolution condemnatory of Lord Ellenborough's despatch to Lord Canning on the affairs of Oude, which for a time seemed certain to overthrow the Derby Government, but which ultimately dissolved into nothing. He obtained a seat in Lord Palmerston's Cabinet of 1859, and after filling the uncongenial posts of secretary for Ireland and chancellor of the duchy of Lancaster (1861), became secretary for the colonies in 1864. Here he reformed the system of colonial defence, refusing to keep troops in the colonies during time of peace unless their expense was defrayed by the colonists; he also laid the foundation of federation in Canada and, rightly or wrongly, censured Sir George Grey's conduct in New Zealand. Resigning with his friends in 1866, he again took office in 1868 as secretary for war. In this post he performed the most memorable actions of his life by the abolition of purchase and the institution of short service, measures which excited more opposition than any of the numerous reforms effected by the Gladstone Government of that period, but which were entirely justified by their successful working afterwards. On the resignation of the Gladstone ministry in 1874 he was raised to the peerage as Viscount Cardwell of Ellerbeck, but took no further prominent part in politics. His mental faculties, indeed, were considerably impaired during the last few years of his life, and he died at Torquay on 15th February 1886. He was not a showy, hardly even a prominent politician, but effected far more than many more conspicuous men. The great administrator and the bold innovator were united in him in an exceptional degree, and he allowed neither character to preponderate unduly. (R. G.)

Cardwell, a town of Queensland, Australia, 950 miles N.W. of Brisbane, on Rockingham Bay, in the county of Cardwell. It has one of the finest harbours in the colony, easy of access in all weathers. Various minerals, including gold, exist in the district. The dugong fishery is carried on and the oil extracted. Population, about 3500.

Carey, Henry Charles (1793-1879), American political economist, was born in Philadelphia 15th December 1793, and at the age of twenty-eight succeeded his father, Mathew Carey—an influential economist, political reformer, editor, and publisher, of Irish birth, but between 1783 and his death in 1839 a resident of Philadelphia—as a member of the publishing firm of Carey and Lea, which was long the most conspicuous in America. Among Mathew Carey's many writings had been a collection (1822) of *Essays on Political Economy*, one of the earliest of American treatises favouring Protection, and Henry C. Carey's life-work was devoted to the propagation of the same theory. He retired from business in 1838, almost simultaneously with the appearance (1837-40) of his *Principles of Political Economy*. This treatise, which was translated into Italian and Swedish, soon became the standard representative in the United States of the school of economic thought which, with some interruptions, has dominated the tariff system of that country for the past half-century; and it exercised a manifest influence upon the writings of such later Protectionists as Bowen, Greeley, and Thompson. To Carey's arguments, more than to those of any other writer, was due the freedom with which his followers, in economic literature and in legislative action, were led to consider the

Principles of Political Economy applied to the Condition, Resources, and Institutions of the American People (the title of Francis Bowen's text-book, 1856), instead of regarding the subject as one leading to general or absolute results. Carey's first large work on political economy was preceded and followed by many smaller volumes on wages, the credit system, interest, slavery, copyright, &c.; and in 1858-59 he gathered the fruits of his lifelong labours into *The Principles of Social Science*, in three volumes. Carey laid chief stress upon the attainment, through political

economy, of beneficent results, intellectual, moral, and financial, to the individual man, whether capitalist, workman, or consumer, and upon a constant claim that the rise of wages is the measure of economic prosperity, inasmuch as in a period of high wages an increased proportion of the value of the product goes to the labourer, while the capitalist receives a smaller proportion though a larger gross amount. He died in Philadelphia, 13th October 1879. [See vol. xix. of the ninth edition of the *Encyclopædia Britannica* (pp. 384-5).]

C A R I C A T U R E.

Great Britain.—During the last quarter of the 19th century the term caricature, somewhat loosely used at all times, came gradually to cover almost every form of humorous art, from the pictorial wit and wisdom of Sir John Tenniel to the weird grotesques of Mr S. H. Sime, from the gay and spirited pleasantries of Randolph Caldecott to the graceful but sedate fancies of Mr Walter Crane. It is made to embrace alike the social studies—whether satirical or sympathetic—of Du Maurier and Keene, the political cartoons of Mr Harry Furniss and Mr F. C. Gould, the unextenuating likenesses of "Ape," and "Spy," and "Max," the subtle conceits of Mr Linley Sambourne, the whimsicalities of Mr E. T. Reed, the exuberant burlesques of Mr J. F. Sullivan, the frank buffooneries of the late W. G. Baxter. Of these diverse forms of graphic humour, some have no other object than to amuse, and therefore do not call for serious notice. The perpetrations of Mr Max Beerbohm ("Max"), for instance, need not be commented upon, though too original to be overlooked; while of the work of "Spy" (Mr Leslie Ward), in *Vanity Fair*, one need only say that if it does not rival the occasional brilliancy of his predecessor "Ape" (Carlo Pellegrini), it maintains a higher average of merit. The pupil, too, is much more genial than the master. Unlike "Ape" and his compatriots of the 17th century, to whose "caricaturas" Addison's *Spectator* applied the description, he does not "transform the most agreeable beauty into the most odious monster"; his feeling for comeliness forbids: when his subject is good-looking, he is content if his pencil evokes the comment, "How ridiculously like!" But caricature of this kind is merely an entertainment. Here we are concerned rather with those branches of caricature which, merrily or mordantly, reflect and comment upon the actual life we live. In treating of recent caricature of this kind, we must give the first place to *Punch*. Mr Punch's outlook upon life has not changed much since the 'seventies. His influence upon the tone of caricature made itself felt most appreciably in the days of John Leech and Richard Doyle. Their successors but follow in their steps. In their work, says a clever German critic, is to be found no vestige of the "sour bilious temper of John Bull" that pervaded the pictures of Hogarth and Rowlandson. Keene and Du Maurier, he declares, are not caricaturists or satirists, but amiable and tenderly grave observers of life, friendly optimists. The characterization is truer of Keene, perhaps, than of Du Maurier. Keene's sketches are almost always cheerful; almost without exception, they make you smile or laugh. In many of Du Maurier's, on the other hand, there is an underlying seriousness. They are aphorisms, criticisms, verdicts upon character and conduct: the work of a less cynical La Rochefoucauld, expressing himself with a pencil as well as with a pen. While Keene looks on at life with easy tolerance, an amused spectator, Du Maurier shows himself sensitive, emotional, sympathetic, taking infinite delight in what is

pretty and gay and charming, but hurt and offended by the sordid and the ugly. Thus while Keene takes things dispassionately as they come, seeing only the humorous side of them, we find Du Maurier ever and anon attacking some new phase of snobbishness, or philistinism, or cant. For all his kindness in depicting congenial scenes, he is at times as unrelenting a satirist as ever Rowlandson was: the difference in their methods is but the difference between the sword-play of Richard and the sword-play of Saladin. The other *Punch* artists whose chief work is in the same field as Keene's and Du Maurier's resemble the former in this respect rather than the latter. Mr Raven-Hill recalls Charles Keene not merely in temperament but in technique; like Keene, too, he finds his subjects principally in *bourgeois* life. Mr J. Bernard Partridge, though, like Du Maurier, he has an eye for physical beauty, is a spectator rather than a critic of life. Mr Phil May, a modern Touchstone, is less easily classified. Though he wears the cap and bells, he is alive to the pity of things; he sees the pathos no less than the humour of his street-boys and "gutter-snipes." He is, however, a jester primarily: a jester with an almost unrivalled faculty for pictorial expression; an artist, too, of high achievement. Two others stand out as masters of the art of social caricature—the late Frederick Barnard and Mr J. F. Sullivan. Barnard's illustrations to Dickens, like his original sketches, have a lively humour all their own—the humour of irrepressible high spirits—and endless invention. High spirits and invention are characteristics also of Mr Sullivan. It is at the British artisan and petty tradesman—at the grocer given to adulteration and the plumber who outstays his welcome—that he aims his most boisterous fun. He rebels too, delightfully, against red tape and all the petty tyrannies of officialdom. In fact, there is hardly a grievance known to London and its suburbs which has not been hilariously vented by Mr Sullivan. In political caricature Sir John Tenniel has remained the leading artist of the period. The death of Abraham Lincoln, Bismarck's fall from power, the tragedy of Khartoum—to subjects such as these, worthy of a great painter, Tenniel has brought a classic simplicity and a sense of dignity unknown previously to caricature. It is hard to say in which field Tenniel most excels—whether in those ingenious parables in which the British Lion and the Russian Bear, John Chinaman, Jacques Bonhomme, and Uncle Sam play their part—or in the ever-changing scenes of the great parliamentary Comedy—or in sombre dramas of Anarchy, or Famine, or Crime—or in those London extravaganzas in which the symbolic personalities of Gog and Magog, Father Thames and the Fog Fiend, the duke of Mudford, and Mr Punch himself, have become familiar. Subjects similar to these have been treated also for many years by Mr Linley Sambourne in his fanciful and often beautiful designs. In the field of humorous portraiture also Mr Sambourne has made his mark, and he may be said almost to have originated, in a small way, that practice of illustrating

EXAMPLES OF ENGLISH CARICATURE.

the doings of Parliament with comic sketches in which Mr Furniss, Mr E. T. Reed, and Mr F. C. Gould are his most notable successors. Mr Furniss has satirized the Royal Academy as effectively as the Houses of Parliament. But he is above all the illustrator of Parliament—the creator of Mr Gladstone's collars, the thief of Lord Randolph Churchill's inches, the immortalizer of so many otherwise obscure politicians, the "artistic contortionist," to use his own expression, who has worked the House of Commons and its doings into so many hundreds of eccentric designs. Though Mr Furniss is a man of strong views, and upholds them with his pencil à outrance, he has never been, as is Mr F. C. Gould (of the *Westminster Gazette*), a politician first and a caricaturist afterwards. Mr Gould is an avowed partisan, and his caricatures are among the most formidable weapons of which the Radical party can boast. Caustic and witty and telling, not specially well drawn, but well drawn enough—the likenesses unfailingly caught and recognizable at a glance—his "Picture Politics," as he calls them, have in this way won him a quite unique place in the ranks of caricaturists. There is no evidence of such strenuousness in the work of Mr E. T. Reed (of *Punch*). In his parliamentary sketches, as in his "Animal Land" and "Prehistoric Peeps," Mr Reed is a wholly irresponsible humorist. One finds keen satire, however, in those "Ready-made Coats of Arms" in which he has turned at once his heraldic lore and his insight into character to such excellent account; as also in such drawings as his fancy portrait "by induction" of his laundress (a virago belabouring his shirts with a spike-studded club), and that more serious picture in which he has drawn a parallel between the *tricoteuses* awaiting with grim enjoyment the fall of the guillotine and those modern English gentlewomen who flock to the Old Bailey as to the play. Here we have the true Hogarthian touch.

It would be too much to say that in the field of comic journalism, since 1870, it has been a case of "Eclipse first, and the rest nowhere"; but though there have been some notable competitors with *Punch*, there has never been a really "good second." In Matt Morgan the *Tomahawk* (1865-67) could boast an original cartoonist after Tenniel's style, but without Tenniel's power and humour, and unsupported by a staff of wits and men of letters such as the great *Punch* artist has always had behind him to keep him well stocked with ideas. Morgan's *Tomahawk* cartoons gained in effect from an ingenious method of printing in two colours. In Fred Barnard, W. G. Baxter, and Mr J. F. Sullivan, *Judy* (founded in 1867) possessed a trio of pictorial humorists of the first rank, and in W. Bowcher a political cartoonist thoroughly to the taste of those hot and strong Conservatives to whom *Punch's* neutrality or, at the most, faint Whiggery, was but Radicalism in disguise. His successor, Mr William Parkinson, was not less loyal to Tory ideas, though more urbane in his methods. *Fren* has had cartoonists of high merit in Mr Gordon Thomson and in Mr John Proctor, who worked also for *Moonshine* (founded in 1879). *Moonshine* afterwards enlisted the services of Mr Alfred Bryan, to whose clever pencil the Christmas number of the *World* was indebted for many years. *Ally Sloper*, founded in 1884, is notable only as the widely circulated medium for W. G. Baxter's wild humours, kept up in the same spirit by Mr W. F. Thomas, his successor. *Pick-me-up*, the latest addition of any note to the comic press of London, could once count a staff which rivalled at least the social side of *Punch*; Mr Raven-Hill, Mr Phil May, Mr Greiffenhagen, and Mr Dudley Hardy have all contributed in their time to its sprightly pages, while Mr S. H. Sime made it the vehicle for his "squint-brained" imaginings. The *Will o' the Wisp*, the *Butterfly*, and the *Unicorn*, kindred ventures, though on different lines, all met with an early death. *Lika Joko*, founded in 1894 by Mr Harry Furniss, who in that year abandoned *Punch*, was also short-lived. To this brief list of purely comic or satirical journals should be added the names of several daily and weekly publications—and among monthlies the *Idler*, with its caricatures by Mr Scott Rankin, Mr Sime, and Mr Beerbohm—which have made a special feature of humorous art. Among these are the *Graphic*, whose Christmas numbers were first brightened by Randolph Caldecott; the *Daily Graphic*, enlivened sometimes by Mr Phil May and Mr A. S. Boyd; *Vanity Fair*, with its grotesque portraits; *Truth*, to whose Christmas numbers Mr F. C. Gould contributed some of his best and most ambitious work, printed in colours; the

Sketch, with Mr Phil May and others; *Black and White*, with Mr Henry Meyer; the *Pall Mall Gazette*, first with Mr F. C. Gould, and later with Mr G. R. Halkett. The *St Stephen's Review*, whose crudely powerful cartoons, the work of Tom Merry, were so popular, ceased publication in 1892. A tribute should be paid in conclusion to the coloured cartoons of the *Weekly Freeman* and other Irish papers, often remarkable for their humour and talent. (See CARTOON and ILLUSTRATION.)

No one has written so well and wittily upon "Social Pictorial Satire" as George du Maurier in his little volume thus entitled, in which he deals more particularly with the work of Leech and Keene, and with his own. Satire, both social and political, will be found treated of or touched upon in a series of articles upon "Our Graphic Humorists," as well as in miscellaneous papers by George du Maurier, Mr Linley Sambourne, Mr M. H. Spielmann, and others, in recent volumes of the *Magazine of Art*. Mr Spielmann's *History of Punch* contains also much information on the subject. The various histories of caricature do not include many of the artists of to-day, but there are interesting allusions to some of them in Muther's *Modern Painting*, vol. II., and in *L'Art du Rire et de la Caricature*, by Arsène Alexandre. (F. W. W.)

France.—In that peculiar branch of art which is based on irony, fun, oddity, and wit, and in which Daumier, next to "Gavarni," remains the undisputed master, France can show an unbroken series of draughtsmen of strong individuality. Though "Cham" died in 1879, Eugène Giraud in 1881, "Randon" in 1884, "André Gill" in 1885, "Marcelin" in 1887, Edouard de Beaumont in 1888, Lami in 1891, Grévin in 1892, and "Stop" in 1899, a new group has arisen under the leadership of the veterans "Nadar" and Carjat. Mirthful or satirical, and less philosophical than of yore, neglecting history for incident, and humanity for the puppets of the day, their drawings, which illustrate daily events, will perpetuate the manner and anecdotes of the time, though the illustrations to newspapers, or in prints which need a paragraph of explanation, show nothing to compare with the *Propos de Thomas Virelocque* by "Gavarni." Quantity perhaps makes up for quality, and some of these artists deserve special mention. "Draner" and "Henriot" are journalists, carrying on the method first introduced by "Cham" in the *Univers Illustré*: realistic sketches, with no purpose beyond the droll illustration of facts, amusing at the time, but of no value to the print-collector. M. Forain, born at Reims, 23rd October 1852, studied at the École des Beaux Arts under Gérôme and Carpeaux. He first worked for the *Courrier Français* in 1887, and afterwards for *Figaro*; he was then drawn into the polemical work of politics. Though he has created some great types of funkeydom, the explanatory story is more to him than the picture, which is often too sketchy; reduced reproductions of his work have been issued in volumes, a common form of popularity never attempted with Daumier's fine lithographs. M. Willette, born at Châlons-sur-Marne in 1857, a son of Colonel Willette, the aide-de-camp to Marshal Bazaine, worked for four years in Cabanel's studio, and so gained an artistic training which alone would have distinguished him from his fellows, even without the delightful poetical fancy and Watteau-like grace which are somewhat unexpected amid the ugliness of modern life. His work has the value, no doubt, of deep and various meaning, but it has also intrinsic artistic worth. M. Willette is, in fact, the ideal delineator of the voluptuous and highly spiced aspects of contemporary life. "Caran d'Ache," a native of Moscow, born in 1859, borrowed from the German caricaturists his methods of illustrating "a story without words." He makes fun even of animals, and is a master of canine physiognomy. His simple and unerring outline is a method peculiarly his own; now and again his wit rises to grandiloquence, as in his *Bellona*, rushing on an automobile through massacre and conflagrations, and in his *Epopée* (Epic) of shadows thrown on a sheet. M. Léandre, born at Champsecret (Orne), in 1862, is, like "André Gill," a draughtsman of monstrosities; he can get a perfect likeness of a face while exaggerating some particular feature, gives his figure a hump-back, as Dantan did in his

statuettes, and has a facial dexterity which sometimes does scant justice to his very original wit. M. Steinlen, born at Lausanne in 1859, came to Paris in 1881. He should be studied in his illustrations to *Bruant*. He knows the inmost core of the Butte-Montmartre, and depicts it with realistic and brutal relish. M. Robida, born at Compiègne in 1848, collaborated with Decaux in 1871 to found *La Caricature*; he is a paradoxical seer of the possible future and a curiosity-hunter of the past. Old Paris has no secrets from him; he knows all the old stones and costumes of the Middle Ages, and has illustrated Rabelais; and for fertility of fancy he reminds us of Gustave Doré. "Bac," born at Vienna, 15th August 1859, has infused a strain of the Austrian woman into the Parisienne; representing her merely as a pleasure- and love-seeking creature, as the toy of an evening, he has recorded her peccadilloes, her witcheries, and her vices. Others who have shot folly as it flies are M. Albert Guillaume, who illustrated the Exhibition of 1900 in a series of remarkable silhouettes; "Mars"; "Henri Somm"; Gerbault; and Grün. M. Huard is a sort of Holbein of provincial life, depicting to perfection the country townsfolk in their elementary psychology. M. Hermann-Paul, M. Forain's not unworthy successor on the *Figaro*, is a cruel satirist, who in a single face can epitomize a whole class of society, and could catalogue the actors of the *comédie humaine* in a series of drawings. M. Jean Veber loves fantastic subjects, the gnomes of fairy-tales and myths; but he has a biting irony for contemporary history, as in the *Butcher's Shop*, where Bismarck is the blood-stained butcher. M. Abel Faivre, a refined and charming painter, is a whimsical humorist with the pencil. He shows us monstrous women, fabulously hideous, drawing them with a sort of realism which is droll by sheer ugliness. Toulouse-Lautrec startles us by extraordinary dislocations, scrawled limbs, and inexplicable anatomy; he has left an inimitable series of sketches of Mme. Yvette Guilbert when she was at her thinnest. M. Valotton reproduces crows in blots of black with a Japanese use of the brush. M. Jeannot, a notable illustrator, sometimes amuses himself by contributing to *Le Rire*, *Le Sourire*, *Le Pompon*, *L'Assiette au Beurre*, etc., drawing the two types he most affects: the fashionable world, and soldiers. M. Ibels, Capiello, and many more might be enumerated, but it is impossible to chronicle all the clever humorous artists of the illustrated papers.

It is the frequent habit of French caricaturists to employ a *nom-de-guerre*. We therefore give here a list of the genuine names represented by the pseudonyms given above:—

"Cham"	= Comte Amédée de Noé.
"Randon"	= Gilbert.
"André Gill"	= L. A. Gosset de Guine.
"Marcelin"	= Emile Planat.
"Stop"	= L. P. Morel-Retz.
"Nadar"	= Félix Tournachon.
"Gavarni"	= S. G. Chevallier.
"Drauer"	= Jules Renard.
"Henriot"	= Henri Maigrot.
"Caran d'Ache"	= E. Poiré.
"Bac"	= Ferdinand Bach.
"Henri Somm"	= H. Sommier.
"Mars"	= Maurice Bonvoisin.

Germany.—During the last quarter of the 19th century German caricature flourished principally in the comic papers *Kladderadatsch* and *Fliegende Blätter*, the former a political paper with little artistic value, in which the ideas alone are clever, whilst the illustrations are merely

a more or less clumsy adjunct to the text, while the *Fliegende Blätter*, on the contrary, has artistic merit as well as wit. Wilhelm Busch, the most brilliant German draughtsman of the last generation, made his *début* with an illustrated poem "The Peasant and the Miller," and won a world-wide reputation with the following works: *Pater Filucius*, *Die Fromme Helene*, *Max und Moritz*, *Der heilige Antonius*, *Maler Kleksel*, *Baldwin Bähldamm*, *Die Erlebnisse Knopps des Junggesellen*. Busch stands alone among caricaturists, inasmuch as he is both the author and the illustrator of these works, his witty doggerel supplying Germany with household words. The drawings that accompany the text are amazing for the skill with which he hits the vital mark; the essential point is seized with the least possible elaboration. A flourish or two and a few touches are enough to set before us figures of intensely comical aspect. This distinguishes Busch from Adolf Oberländer, who became the chief draughtsman on *Fliegende Blätter*. Busch's drawings would have no meaning apart from the humorous words. Oberländer works with the pencil only. Men, lions, tigers, hares, dogs, trees, houses, plants, are endowed by him with a mysterious life of their own. Without the help of any verbal joke, he achieves the funniest results simply by seeing and accentuating the comical side of everything. His drawings are caricature in the strict sense of the word, its principle being the exaggeration of some natural characteristic. The new generation of contributors to *Fliegende Blätter* do not work on these lines. Busch and Oberländer were both offshoots of the romantic school; they made fun of modern novelties. Hermann Schlittgen, René Reinicke, Adolf Hengeler, and Fritz Wehle are the sons of a self-satisfied time, triumphing in its own *chic*, elegance, and grace; hence they do not parody what they see, but simply depict it. The wit lies exclusively in the text; the illustrations aim merely at a direct representation of street or drawing-room scenes. It is this which gives to *Fliegende Blätter* its value as a pictorial record of the history of German manners. Its pages are a permanent authority on the subject for those who desire to see the social aspects of Germany during the last quarter of the 19th century. At the same time a falling-off in the brilliancy of this periodical has been perceptible. Its fun has become domestic and homely; it has faithfully adhered to the old technique of wood-engraving, and has made no effort to keep pace with the modern methods of reproduction. These have, in fact, undergone a complete revolution in two different ways: on the one hand, wood-printing, engraving, and lithography in colour have been developed to a high degree of perfection, and the improvement in the mechanical technique of engraving allows of a reproduction in facsimile of the most delicate shades of colour; on the other hand, the art of the poster has aroused a previously dormant feeling for decorative design and the expressive value of pure lines. Toulouse-Lautrec, Steinlen, and Grasset have, in France, worked out to its utmost finality a technique derived from the style of Hokusai and Utamaro. German caricature, to live and flourish, must keep pace with this development; it had to take into its service the gay effects of colour, and derive fresh inspiration from the sweeping lines of the ornamental draughtsman. This led to the appearance of three new weekly papers: *Jugend*, *Das Narrenschiff*, and *Simpli-cissimus*. *Jugend*, started in 1896 by Georg Hirth in Munich, collected from the first a group of gifted young artists, more especially Bernhard Pankok and Julius Diez, who based their style on old German wood-engraving; Fidus, who lavished the utmost beauty of line in unshaded pen-and-ink work; Rudolf Wilke, whose grotesques have much in common with Forain's clever drawings; Angelo

"OUR NATIONAL GAME." By A. B. FROST (from *Harper's Magazine*, Jan. 1890; copyright 1890, by HARPER & BROTHERS, New York & London).

"AN ILL-MATCHED TEAM." By C. G. BUSH (from the *New York World*).

"HE'LL BE LUCKY IF HE GETS HIS TROUSERS BACK." By HOMER DAVENPORT (from the *New York Journal*).

"WHO STOLE THE PEOPLE'S MONEY?" "TWAS HIM." By THOMAS NAST (from *Harper's Weekly*).

"GOLF IS NOT THE ONLY GAME ON EARTH." By C. D. GIBSON (by permission of JAMES HENDERSON AND SONS, London).

EXAMPLES OF AMERICAN CARICATURE.

Jank and R. M. Eichler, who work with a delightful *bonhomie*. Among the draughtsmen on the *Narrenschiff* (The Ship of Fools), Hans Baluschek is worthy of mention as having made the types of Berlin life all his own; and while this paper gives us for the most part inoffensive satire on society, *Simplicissimus*, first printed at Munich and then at Zurich, under the editorship of Albert Langen, shows a marked Socialist and indeed Anarchist tendency, subjecting to ridicule and mockery everything that has hitherto been held as unassailable by such weapons; it reminds us of the scathing satire of Honoré Daumier in *La Caricature* at the time of Louis Philippe. Thomas Theodor Heine is unsurpassed in this style for his power of expression and variety of technique. Here we admire his delicate draughtsmanship; there he gives us the broad and monumental grotesque; or, again, we find him drawing his figures with the heavy line of heraldic ornament. His laughter is often insolent, but he is more often the preacher, scourge in hand, who ruthlessly unveils all the dark side of life. Next to him come Paul, the incomparable limner of student life and the manners and customs of the Bavarian populace; E. Thöny, the wonderfully clever caricaturist of the airs and assumption of the Prussian *Junker* and the Prussian subaltern; J. C. Eugh and F. von Regnieck, who make fun of the townsman and political spouter in biting and searching satire. The standard of caricature is at the present time a high one in Germany; indeed, the modern adoption of the pen-line, which has arisen since the impressionists in oil-painting repudiated line, had its origin in the influence of caricature. (R. MR.)

United States.—The proverbial irreverence of the American mind even towards its most cherished personages and ideals has made it particularly fallow ground for the growth of caricature. The seeds of this, as of the other arts in whose cultivation America is now so strenuously engaged, were borne across the ocean on the winds of immigration. They were slow in taking root, and the first growths led a precarious and stunted existence, in sharp contrast with their present prevalence and prosperity, which flourish in places even to rankness. In the early period of American caricature, almost the only native name is that of F. O. C. Darley, an illustrator of some importance; the other names include the engraver Paul Revere (chiefly famous for a picturesque exploit in the War of Independence); a Scotsman, William Charles; the Englishmen, Matt Morgan and F. P. Bellew; and the Germans, Thomas Nast and Joseph Keppler.

The name of Thomas Nast overshadows and sums up American political caricature, as the word Homer typifies Greek epopee. Nast, who was born in Bavaria, 27th September 1840, was brought to America at the age of six; and as his training and all his interests were strongly American, he may be forgiven the accident of birth. At fourteen he was an illustrator on *Leslie's Weekly*, and was sent at twenty to England to illustrate the famous Sayers-Heenan prize-fight. He then went as recorder of Garibaldi's warfare. He returned to America known only as an illustrator. The Civil War did not awaken his latent genius till 1864, when he published a cartoon of fierce irony against the political party which opposed Lincoln's re-election and advocated peace measures with the Southern confederacy. This cartoon not only made Nast famous, but may be said to contain the germ of American caricature; for all that had gone before was too crude in technique to pass muster even as good caricature.

The magnificent corruption of Tammany Hall under the leadership of Alderman Tweed, the first of the great municipal "bosses," gave Nast a subject worth attacking. Siegfried,

earnest but light-hearted, armed with the mightier sword of the ridiculing pen, assailed the monster ensconced in his treasure-cave, and after a long battle won a brilliant victory. Nast did not always rely on a mere picture to carry his thrust; often his cartoon consisted of only a minor figure or two looking at a large placard on which a long and poignantly-worded attack was delivered in cold type. At other times the most ingenious pictorial subtlety was displayed. This long series runs almost the whole gamut of caricature, from downright ridicule to the most lofty denunciation. A very happy device was the representation of Tweed's face by a money-bag with only dollar marks for features, a device which, strangely enough, made a curiously faithful likeness of the "boodle"-loving despot. When, finally, Tweed took to flight, to escape imprisonment, he was recognized and caught, it is said, entirely through the wide familiarity given to his image in Nast's cartoons. Though Nast kept up for many years a running fire of comment on the legitimate subjects open to an alert and brilliant caricaturist (a cartoon on Napoleon III. being one of his best works), and though he had technical skill enough to illustrate many subjects well (an annual Santa Claus picture being an important yearly event in the nursery world), he will always be remembered for having earned one of the most direct and most difficult material victories ever granted to caricature.

When Nast retired from *Harper's Weekly* he was succeeded by Charles Green Bush (born at Boston, 1872), who speedily showed his ability to wear the mantle well. With even larger technical resources, he has poured forth a series of cartoons of remarkable evenness of skill and interest; he soon left weekly for daily journalism. Mr Bush was, in 1901, the recognized dean of American caricature. He has never won, single-handed, such a battle as Nast's, but his drawings have a more general, perhaps a more lasting interest. When he left *Harper's Weekly* he was succeeded by W. A. Rogers, who was called in from general illustration and has composed many ingenious and some telling cartoons.

The vogue which, through Nast, *Harper's Weekly* gave to caricature, prepared the way for the first purely comic weekly that escaped the grim fate which frequently attends the birth of comic papers. This was *Puck*, founded by two Germans, and for long published in a German as well as an English edition. It is worth noting that not only the founders but the spirit of American caricature have been rather German than English, the American comic papers more closely resembling *Fliegende Blätter*, for example, than *Punch*. One of the founders of *Puck* was Joseph Keppler, long its chief caricaturist. It has cast its influence generally in favour of the Democratic party. The Republican party soon found a champion in *Judge*, a weekly which resembles *Puck* closely in its crude-coloured pages, though somewhat broader and less ambitious in the spirit and execution of its black-and-white illustrations. These two papers have kept rather strictly to permanent staffs, and have furnished the opening for many popular draughtsmen, such as Bernhard Gillam (died 1896), and his brother, Victor Gillam; J. A. Wales; E. Zimmerman, whose extremely plebeian and broadly treated types often obscure their genuine observation and Falstaffian humour; Grant Hamilton; Frederick Oppen, for many years devoted to the trials of suburban existence, more recently concerned in combating the trusts; C. J. Taylor, a graceful technician; H. Smith; Frank A. Nankivell, whose pretty athletic girls are prone to attitudinizing; J. Mortimer Flagg; F. M. Howarth; Mrs Frances O'Neill Latham, whose personages are singularly well modelled and alive, and Miss Baker Baker, a skilful draughtswoman of animals.

A stimulus to genuine art in caricature was given by the establishment of the well-groomed society weekly, *Life*, edited by J. A. Mitchell, a clever draughtsman as well as an original writer. It is to this weekly that America owes the discovery and encouragement of its most remarkable penman, Charles Dana Gibson, whose technique has developed through many interesting phases from an exceeding delicacy to a sculpturesque boldness of line without losing its rich texture or becoming monotonous. Mr Gibson is chiefly beloved by his public for his almost idolatrous realizations of the beautiful American woman of various types, ages, and environments. His works are, however, full of the most subtle character-observations, and American men of all walks of life, and foreigners of every type, impart as much importance and humour to his pages as his "Gibson girls" give radiance. His resemblance to Du Maurier, in reverence for the beautiful woman beautifully attired, has led some critics to set him down as a mere disciple, while his powerful individuality has led other critics to accuse him of monotony; but a serious examination of his work is held by others to show that he has gone beyond the genius of Du Maurier in sophistication, if not in variety of subjects and treatment, while it would be hard to find another artist who has so studiously tried new experiments in the new fields opened by modernized processes of photo-engraving. He has been an important influence in both English and American line-illustration.

Among other students of society, particular success has been granted to C. S. Reinhart (1844-1896), Charles Howard Johnson (died 1895), H. W. McVickar, S. W. van Schaick, A. E. Sterner, W. H. Hyde, W. T. Smedley, and A. B. Wenzell, each of them strongly individual in manner and often full of *verve* and truth.

Life, and other comic papers, including for many years *Truth*, also brought forward caricaturists of distinct worth and a marked tendency to specialization. F. E. Atwood (died 1900) was ingenious in cartoons lightly allegorical; Oliver Herford has shown a fascination elusive of analysis in his drawings as in his verse; T. S. Sullivan has made a quaintly intellectual application of the world-old devices of large heads, small bodies, and general upsetting of the rule of three; Peter Newell has developed individuality both in treatment and humour; E. W. Kemble stands well to the front among the exploiters of negro life; and H. B. Eddy, Augustus Dirk, Robert Wagner, A. Anderson, F. Sarka, and T. Swinnerton have all found manners and moods quite their own.

In distinction from the earlier period, the present school of American caricature is strongly national, not only in subject, but in origin, training, and in mental attitude, exception being made of a few notable figures such as Michael Angelo Woolf, born in England, and of a somewhat Cruikshankian technique. He came to America while young, and contributed a long series of what may be called slum-fantasies, rich in a spirit often equivocal with laughter and sorrow, at times strangely combining extravagant melodrama with a most plausible and convincing impossibility. His drawings must always lie very close to the affections of the large audience that welcomed them. American also by adoption is Henry Mayer, a German by birth, who has contributed to many of the chief comic papers of France, England, Germany, and America. His work is as full of variety as it is cosmopolitan, and its exuberant spontaneity finds skill ready for every flight of whim.

Entirely native in every way is the art of A. B. Frost (born 1851), who is prominent in the fields of pure humour as comment on real or apparently real life among the common people. His caricature—for he is also an

illustrator of versatility and importance—is distinguished by its anatomic knowledge, or, rather, anatomic imagination. Violent as the action of his figures frequently is, it is always convincing. Such triumphs as the tragedy of the kind-hearted man and the ungrateful bull-calf; the spinster's cat that ate rat-poison by mistake and went mad; the discomfiture of the two deserters with the clothes-basket; and many others, force the most serious to laughter by their amazing velocity of action and their unctuousness of expression; but they fasten on the memory, and for years the mere thought of them brings back the old-time merriment. Frost is to American caricature what "Artemus Ward" has been to American humour. Frost's field of publication has been chiefly the monthly magazine.

The influence of the weekly periodicals has been briefly traced. A more recent development has been the entrance of the omnivorous daily newspaper into the field of both the magazine and the weekly. For many years almost every newspaper has printed its daily cartoon, generally of a political nature. Few of the cartoonists have been able to keep up the pace of a daily inspiration, though Mr C. G. Bush has been unusually successful in the attempt. But an occasional success atones in the public mind for many slips, and the cartoonists are known and eagerly watched. The most influential has doubtless been Homer C. Davenport, whose slender artistic resources have been eked out by a vigour and mercilessness of assault rare even in American annals. He has a Rabelaisian complacency and skill in making a portrait magnificently repulsive, and his caricatures are a vivid example of the school of cartoonists who believe in slashing rather than merely prodding or tickling the object of attack. Charles G. Nelan frequently scores, and throughout the wide extent of the United States one finds keen wits busily assailing the manifold evils of life. Noteworthy among them are: Thos. E. Powers, H. R. Heaton, A. L. Levering, Clare Angell, and R. C. Swayne. Many of the daily papers publish a weekly comic supplement; some even devote a page every day to humour. The quality of most of this is inevitably low, yet enlarged artistic opportunities usually evoke increased achievement, and entice many a brilliant mind that would otherwise have sought some other outlet. Among the increasing crowd of American caricaturists there are already enough important figures to justify a reasonable confidence in the future. (R. Hv.)

Carimata (Dutch, *Karimata*), a group of islands in the East Indian Archipelago, west of Borneo and between 1° 11' and 1° 46' S. lat., and 108° 40' and 109° 28' E. long. Great Carimata, on which is the village (kampong) of Palembang, rises in its highest point to 2620 feet. The industries are fisheries, forest products, and iron-mining. Population, about 500.

Carinthia (German, *Kärnten*), a duchy and crownland of the Cisleithan part of the Austro-Hungarian monarchy. Population (1880), 348,730; (1890), 361,008, equivalent to 90.12 inhabitants per square mile. Proportion of females to males, 1046 to 1000: 71.6 per cent. were German, and 28.4 Slovenes; the latter mostly settled in the districts adjoining the Slovene province of Carniola. 94.8 per cent. were Roman Catholic, the rest Protestant. Population in 1900, 367,344. In 1896 the marriage-rate was 5.65; the birth-rate, 32.88, or, excluding still-births, 31.78; and the death-rate, 26.38. Of the births, 43.34 per cent. were illegitimate, a declining ratio. Carinthia has the largest proportion in Austria of illegitimacy and of cretins. The crownland returns ten members to the Reichsrath. In

the Diet there are thirty-four Germans and three Slovenes. Education is decidedly backward, although an improvement is now visible, the number of illiterates in 1890, 29.6 per cent., showing an improvement of 10 per cent. on the census of 1880. In 1895 there were four gymnasia, a theological seminary, seven technical institutions (including three agricultural academies and a school of mining), and 374 elementary schools. Less than 14 per cent. of the soil is arable, and the crops are insufficient for the requirements of the population. Cattle-breeding is of greater importance, and all descriptions of live stock show an increase, with the exception of sheep. The mines (lead—the most important in the monarchy—iron, lignite, zinc), and the industries dependent upon them, are the chief resources of the population. Other trades are the manufacture of leather, paper, cloth, and cement, brewing, distilling, &c. In 1897 the value of the minerals was £150,996, and of the furnace products £185,100. But the manufacture of lead, steel, and iron wares, including rails and railway material, agricultural implements, and small-arms, is of greater importance. In 1897 Carinthia had 447 kilometres of railway, 1754 kilometres of roads, and 393 kilometres of waterway, of which two-thirds was only available for floating timber.

AELSCHKE's *Geschichte Kärntens* (Klagenfurt, 1885); and his *Heimatkunde von K.* (Klagenfurt, 1886); KRONES, *Die alte Geschichte Kärntens von der Urzeit bis Kaiser Karl dem Grossen* (Klagenfurt, 1893); and VON RADICS, *Kärnten, Kultur- und Reisebilder* (Vienna, 1882). (Æ. O'N.)

Carleton Place, a town and port of entry of Lanark county, Ontario, Canada, situated 30 miles S.W. of Ottawa, on the Mississippi river, and at the junction of the main line and Brockville branch of the Canadian Pacific railway. It has abundant water-power privileges, and contains extensive railway-repair shops and woollen mills. Population (1881), 1975; (1891), 4435; (1901), 4059.

Carlisle, a city, municipal borough (extended 1887), parliamentary borough (since 1885 returning only one member), and county town of Cumberland, England, on the Eden, 300 miles N.N.W. of London by rail, and 301 by road. Eight lines of railway converge on Carlisle, making it a very important railway junction. Recent constructions are the Victoria railway viaduct, public baths, the city hall, the market, large public slaughter-houses, and the museum, art gallery, library, &c. The Cumberland Infirmary and the home for incurables have been extended, and large works for locomotives, carriages, and waggons established. The gas-works and the electric-light works are vested in the corporation, whilst the electric tramways (the property of a company) are worked with electric energy supplied by the corporation. Extended area of municipal borough, 2025 acres; population (1881), 36,585; (1891), 39,176; (1901), 45,478. Area of parliamentary borough, 1570 acres; population (1881), 36,585; (1901), 43,687.

Carlisle, a borough of Pennsylvania, U.S.A., and capital of Cumberland county, situated in Cumberland Valley, south of the Blue Ridge, in the southern part of the state, at the intersection of the Cumberland Valley railway with a branch of the Philadelphia and Reading, at an altitude of 473 feet. It is the seat of Dickinson College for boys and Metzger Institute for girls, and of a training school for Indians, of whom about 1000, both boys and girls, are usually in attendance. Population (1880), 6209; (1890), 7620; (1900), 9626.

Carloforte, a town of Italy, Sardinia, province of Cagliari, situated on the E. side of the island of San Pietro, off the S.W. coast of Sardinia. It has grown out

of a Genoese colony founded here in 1737 by Charles Emmanuel of Savoy. It carries on tunny fishing and the preparation of salt, and exports these products, as well as zinc and lead from mines on the main island. The coral fishing came to an end in 1898, owing to exhaustion of the banks. Population, about 7000.

Carlos (CHARLES MARIA DE LOS DOLORES JUAN ISIDORE JOSEPH FRANCIS QUIRIN ANTONY MICHAEL GABRIEL RAPHAEL) (1848—), prince of Bourbon, known as DON CARLOS, was born at Laibach on 30th March 1848, being the eldest surviving son of Don Juan of Bourbon and of the archduchess Maria Beatrix, daughter of Francis IV., duke of Modena. Don Carlos, who styles himself duke of Madrid, and is sometimes called Charles VII. by his partisans, is the fourth pretender who has disputed the rights of the reigning branch of the Spanish Bourbons. He is the grandson of the first pretender, also a Don Carlos and Infante of Spain, brother of Ferdinand VII., who waged war from 1833 to 1840 against Queen Isabella II., the daughter and heiress of that king. The first pretender's eldest son, the count of Montemolin, was taken prisoner by the troops of Queen Isabella, and had to abdicate and renounce his rights in order to regain his liberty, whereupon his younger brother, Don Juan, claimed to be the representative of the rights of the first Don Carlos. Don Juan himself abdicated in favour of his son, Don Carlos, in 1868, when the latter was only twenty. The present pretender married in February 1867, at Frohsdorf, Princess Marguerite, daughter of the duke of Parma and niece of the comte de Chambord, who was born on 1st January 1847, and who bore him a son, Don Jaime, in 1870, and three daughters. Don Carlos boldly asserted his pretensions to the throne of Spain two years after the revolution of 1868 had driven Queen Isabella II. and the other branch of the Bourbons into exile. His manifesto, addressed to his brother Alfonso, namesake of his rival, Alfonso XII., found an echo in the fanatical priesthood and peasantry of many provinces of the Peninsula, but little support among the more enlightened middle classes, especially in the towns. The first rising was started in Catalonia by the brother of the pretender, who himself entered Spain by way of Vera, in the Basque provinces, on 21st May 1872. The troops of King Amadeus under General Moriones, a progressist officer, who was one of Spain's ablest and most popular commanders, surprised and very nearly captured the pretender at Oroquieta, sending him a fugitive to France in headlong flight with a few followers. For more than a year he loitered about in the French Pyrenees, the guest of old noble houses who showed him much sympathy, while the French authorities winked at the fact that he was fomenting civil war in Spain, where his guerilla bands, many of them led by priests, committed atrocities, burning, pillaging, shooting prisoners of war, and not unfrequently ill-using even foreign residents and destroying their property. When the Federal Republic was proclaimed on the abdication of King Amadeus, the Carlists had overrun Spain to such an extent that they held all the interior of Navarre, the three Basque provinces, and a great part of Catalonia, Lower Aragon, and Valencia, and had made raids into the provinces of Old Castile and Estremadura. Don Carlos re-entered Spain on 15th July 1873, just before the Carlists took Estella, in Navarre, which became, with Tolosa and Durango in the Basque provinces, his favourite residence. He displayed very lax morals and an apathy which displeased his staff and partisans. Don Carlos was present at some fights around Estella, and was in the neighbourhood of Bilbao during its famous siege of three months in 1874 until its relief by Marshals Serrano and

Concha on 2nd May. He was also present at the battle near Estella on 27th June 1874, in which Marshal Concha was killed and the Liberals were repulsed with loss. Twice he lost golden opportunities of making a rush for the capital—in 1873, during the Federal Republic, and after Concha's death. From the moment that his cousin Alfonso XII. was proclaimed king at Sagunto, at Valencia, in Madrid, and at Logroño, by General Campos, Daban, Jovellar, Primo de Rivera, and Laserna, the star of the pretender was on the wane. Only once, a few weeks after the Alphonsist restoration, the army of Don Carlos checked the Liberal forces in Navarre, and surprised and made prisoners half a brigade, with guns and colours, at Lacar, almost under the eyes of the new king and his headquarters. This was the last Carlist success. The tide of war set in favour of Alfonso XII., whose armies swept the Carlist bands out of Central Spain and Catalonia in 1875, while Marshal Quesada, in the upper Ebro valley, Navarre, and Ulava, prepared by a series of successful operations the final advance of 180,000 men, headed by Quesada and the king, which defeated the Carlists at Estella, Peña Plata, and Elgueta, thus forcing Don Carlos with a few thousand faithful Carlists to retreat and surrender to the French frontier authorities in March 1876.

The pretender went to Pau, and there, singularly enough, issued his proclamations bidding temporary adieu to the nation and to his volunteers from the same chateau where Queen Isabella, also a refugee, had issued hers in 1868. From that date Don Carlos became an exile and a wanderer, travelling much in the Old and New World, and raising some scandal by his mode of life. He fixed his residence for a time in England, then in Paris, from which he was expelled at the request of the Madrid Government, and next in Austria, before he took up his abode at Viareggio in Italy. Like all pretenders, he never gave in, and his pretensions, haughtily reasserted, often troubled the courts and countries whose hospitality he enjoyed. His great disappointment was the coldness towards him of Pope Leo XIII., and the favour shown by that Pontiff for Alfonso XII. and his godson, Alfonso XIII. Don Carlos had two splendid chances of testing the power of his party in Spain, but failed to profit by them. The first was when he was invited to unfurl his flag on the death of Alfonso XII., when the perplexities and uncertainties of Castilian politics reached a climax during the first year of a long minority under a foreign queen-regent. The second was at the close of the war with the United States and after the loss of the colonies, when the discontent was so widespread that the Carlists were able to assure their prince that many Spaniards looked upon his cause as the one untried solution of the national difficulties. Don Carlos showed his usual lack of decision; he wavered between the advice of those who told him to unfurl his standard with a view to rally all the discontented and disappointed, and of those who recommended him to wait until a great *pronunciamiento*, chiefly military, should be made in his favour—a day-dream founded upon the coquetting of General Weyler and other officers with the Carlist Senators and Deputies in Madrid. Afterwards the pretender continued to ask his partisans to go on organizing their forces for action some day, and to push their propaganda and preparations, which was easy enough in view of the indulgence shown them by all the governments of the regency and the open favour exhibited by many of the priesthood, especially in the rural districts, the religious orders, and the Jesuits, swarming all over the kingdom. After the death of his first wife in 1893, Don Carlos married in the following year Princess Marie Bertha of Rohan. His son by his first wife, Don Jaime, was educated in Austrian and British military schools before

he entered the Russian army, in which he holds the rank of a colonel of dragoons.

Carlos I. (1863.—), king of Portugal, the third sovereign of Portugal of the line of Braganza-Coburg, was the son of King Luiz I. and Maria Pia, daughter of King Vittorio Emanuele of Italy, being born 28th September 1863. When about twenty years of age he spent a considerable time in travelling. He visited England in 1883. On 22nd May 1886 he married Marie Amélie, daughter of Philippe, duc d'Orléans, comte de Paris, and on the death of his father, 19th October 1889, succeeded to the throne of Portugal. In that year the British Government found it necessary to make formal remonstrances against Portuguese encroachments in South Africa, and relations between the two countries were greatly strained for some time. The king's attitude during this critical period was one of conciliation, and his temperate, though firm, speech on opening the Cortes in January 1890 did much to strengthen the party of peace. In 1900-1 also his friendly attitude towards Great Britain was shown by cordial toasts at a banquet to the officers of the British fleet at Lisbon. The king has been a great patron of science and literature; in March 1894 he took a very active part in the celebration of the 500th anniversary of the birth of Prince Henry the Navigator, and a year later he decorated the Portuguese poet João de Deus with much honour at Lisbon. He has taken a great personal interest in deep-sea soundings and marine exploration, and has published an account of some of his own investigations, the results themselves being shown at an oceanographic exhibition opened by him on 12th April 1897.

Carlow, an inland county of Ireland, province of Leinster.

Population.—The area of the judicial county in 1900 was 221,458 acres, of which 71,486 were tillage, 122,649 pasture, 114 fallow, 3240 plantation, 688 turf bog, 2367 marsh, 10,647 barren mountain, and 10,267 water, roads, fences, &c. The new administrative county, under the Local Government (Ireland) Act, 1898, includes the portion of the town of Carlow formerly situated in Queen's County. Population (1881), 46,568; (1891), 41,964; (1901), 37,723, of whom 18,991 were males and 18,732 females, being a decrease of 10·1 per cent., divided as follows among the different religions:—Roman Catholics, 33,381; Protestant Episcopalians, 3950; Presbyterians, 156; Methodists, 198; others, 38. The decrease of population between 1881 and 1891 was 12·1 per cent. The average number of persons to an acre was 19. Of the total population 35,345 persons inhabited the rural districts, being an average of 119 to each square mile under crops and pasture. The following table gives the degree of education in 1891:—

	Males.	Females.	Total.	Percentage.		
				R. C.	Pr. Epis.	Presb.
Read and write .	13,840	13,514	27,354	71·5	89·4	94·0
Read only . . .	1,988	2,341	4,279	12·4	5·2	1·0
Illiterate . . .	2,829	2,709	5,538	16·1	5·4	5·0

In 1881 the percentage of illiterates among Roman Catholics was 21·4. In 1891 there were 6 superior schools, with 396 pupils (344 Roman Catholics and 52 Protestants), and 83 primary schools, with 5791 pupils (5092 Roman Catholics and 699 Protestants). The number of pupils on the rolls of the national schools on 30th September 1899 was 6275, of whom 5530 were Roman Catholics and 745 Protestants.

The following table gives the number of births, deaths, and marriages in various years:—

Year.	Births.	Deaths.	Marriages.
1881	937	754	177
1891	817	772	140
1899	847	698	145

In 1899 the birth-rate per 1000 was 20·2, and the death-rate 16·6; the rate of illegitimacy was 4·3 per cent. of the total births. The total number of emigrants who left the county between 1st

May 1851 and 31st December 1899 was 32,009, of whom 16,425 were males and 15,584 females. The following are the chief towns in the county, with their populations in 1891:—Carlow, 6619; Bagenalstown, 1920; Tullow, 1773.

Administration.—The county returns 1 member to Parliament, the number of registered electors in 1900 being 8132. The rateable value in 1900 was £169,401. By the Local Government (Ireland) Act, 1898, the fiscal and administrative duties of the grand jury and (to a less extent) of other bodies were transferred to a county council, urban and rural district councils were established, and under that Act the county now comprises 1 urban and 3 rural sanitary districts.

Agriculture.—The following tables show the acreage under crops (including meadow and clover), and the amount of live stock, in 1881, 1891, 1895, and 1900. The figures for 1900 are for the new administrative county:—

	Wheat.	Oats.	Barley, etc.	Potatoes.	Turnips.	Other Green Crops.	Meadow and Clover.	Total.
1881	3409	20,209	5404	9856	4972	1830	31,275	76,955
1891	1483	20,174	5157	9532	5192	2130	31,045	74,713
1895	120	21,902	4958	8515	5759	1952	33,501	76,707
1900	405	19,428	5499	7918	5656	2046	30,534	71,486

For 1899 the total value of cereal and other crops was estimated by the Registrar-General at £515,840. The number of acres under pasture in 1881 was 116,694; in 1891, 116,175; and in 1900, 122,649.

	Horses and Mules.	Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.
1881	8649	2556	44,519	60,078	21,411	3380	176,909
1891	9089	2763	46,811	89,128	24,611	3937	198,728
1895	9493	2876	48,787	79,696	22,560	3387	204,526
1900	8867	3358	47,814	97,645	22,486	3044	225,168

The number of milch cows in 1891 was 12,070, and in 1900 11,674. It is estimated that the total value of cattle, sheep, and pigs in 1900 was £827,223. In 1900 the number of holdings not exceeding 1 acre was 1576; between 1 and 5, 625; between 5 and 15, 817; between 15 and 30, 994; between 30 and 50, 834; between 50 and 100, 840; between 100 and 200, 349; between 200 and 500, 108; and above 500, 7—total, 6150. The number of loans issued (the number of tenants being the same as the number of loans) under the Land Purchase Acts 1885, 1891, and 1896, up to 31st March 1900, was 155, amounting to £129,570. The number of loans sanctioned for agricultural improvements under sect. 31 of the Land Act, 1881, between 1882 and 1900, was 114, and the amount issued was £10,541. The total amount issued on loan for all classes of works under the Land Improvement Acts, from the commencement of operations in 1847 to 31st March 1900, was £109,969.

(W. H. Po.)

Carlsbad, or KAISER-KARLSBAD (Czech, *Karlovy Vary*), a royal free town and celebrated watering-place in Bohemia. The population in 1890 was 12,033; in 1900 (estimated), 14,640, all German and chiefly Catholic (about 9 per cent. Jewish and 2 per cent. Protestant). In 1896 the total number of visitors rose to 42,448. There has been a corresponding increase in the accommodation, the houses having been increased by 114 in the period 1887-96, 33 of these being public buildings. Carlsbad has an important porcelain and stoneware industry, cutlery, confectionery, &c.

There is an extensive literature on the curative properties of the waters, comprising works by Mannl (*Carlsbad and its Mineral Springs*, Leipzig, 1850), Hochstetter, Semler, Hertzka, Fleckles, Kraus, Sorger, Kafka, Hlawacek, Cartellieri, Stephanides, and Sipöcz.

Carlsrona, the chief naval station of Sweden, on the S. coast, 53 miles S.S.W. from Calmar by rail (line opened in 1899). A bronze statue of Charles XI., the founder of the town, was unveiled in 1897. There are factories for naval equipments, canvas, leather, and rice, and granite quarries. About 550 vessels of 110,000 tons clear the port annually. Principal exports—granite and timber. Imports—coal, cereals and flour, groceries, hides, machinery, etc. Population (1880), 18,300; (1898), 23,507.

Carlshamn, a seaport town of Sweden, on the S. coast, 28 miles by rail W. from Carlsrona. It has a school of navigation, and an export trade in timber, spirits, and fish. The industries embrace distilleries, tanneries, tobacco factories, &c. Population (1880), 6402; (1898), 7074.

Carlsruhe, a town of Germany, capital of grand-duchy of Baden, 33 miles by rail S. by W. of Heidelberg, and 5 miles E. of the Rhine. The fan-like form of the plan of the city, already described in the article in the ninth edition, has been rigidly adhered to in the new suburbs. The city as a whole makes the impression of uniformity and elegance. Amongst the new buildings probably the most noteworthy are the joint museum of the grand-ducal and national collections (natural history, archaeology, ethnology, art, and a library of over 150,000 volumes); the palace of the heir-apparent, a late Renaissance building of 1891-96; the imperial bank (1893); the national industrial hall, with an exhibition of machinery, &c.; and the new law courts. The hall of fine arts, which shelters a good picture gallery, was enlarged in 1896. Carlsruhe possesses further the Zähringer museum of curiosities, &c., in the left wing of the castle, an architectural school (1891), industrial art school and museum, cadet school (1892), botanical and electro-technical institutes, industrial art school, art school, trades and commercial schools, and horticultural and agricultural schools. Of its recent public monuments may be mentioned one to Von Scheffel (1892), who was born here in 1826, and died here in 1886; a bronze equestrian statue of the Emperor William I. (1896); and a memorial of the 1870-71 war. Carlsruhe is the headquarters of the 14th German army corps. Since 1870 the industry of the town has grown rapidly, as well as the town itself. Here are large railway workshops. The principal branches of industry are concerned with the making of locomotives, vehicles, implements and machinery, silvered wares, art furniture, gloves, cement, carpets, perfumery, and beer. There is an important arms factory. Maxau, on the Rhine, serves as the river port of Carlsruhe, and is connected with it by a canal finished in 1901. Population (1885), 61,066; (1895), 84,030; (1900), 96,876.

Carlstad, a town of Sweden, capital of province of Vermland, stands at the N. end of Lake Wener, 205 miles W. from Stockholm by rail to Christiania. There are ironworks and match factories, and a mineral spring. Population (1880), 7772; (1898), 10,015.

Carlisle, a burgh of barony of central Lanarkshire, Scotland, 19½ miles S.E. of Glasgow by rail. Fruit is largely grown in the district, and a preserve factory and engineering works are among the industrial features. Original Secession and Congregational chapels have been erected. Population (1881), 3867; (1901), 4731. The parish contains four villages, the largest, Law, an important railway junction. Population (1901), 8962.

Carlyle, Thomas (1795-1881), British essayist, historian, and philosopher, born on 4th December 1795 at Ecclefechan, in Annandale, was the eldest of the nine children of James Carlyle by his second wife, Janet Aitken. The father was by trade a mason, and afterwards a small farmer. He had joined a sect of seceders from the Kirk, and had all the characteristics of the typical Scottish Calvinist. He was respected for his integrity and independence, and a stern outside covered warm affections. The family tie between all the Carlyles was unusually strong, and Thomas regarded his father with a reverence which found forcible expression in his *Reminiscences*. He always showed the tenderest

love for his mother, and was the best of brothers. The narrow means of his parents were made sufficient by strict frugality. He was sent to the parish school when seven, and to Annan grammar-school when ten years old. His pugnacity brought him into troubles with his fellows at Annan; but he soon showed an appetite for learning which induced his father to educate him for the ministry. He walked to Edinburgh in November 1809, and entered the University. He cared little for any of the professors, except Sir John Leslie, from whom he learned some mathematics. He acquired a little classical knowledge, but the most valuable influence was that of his contemporaries. A few lads in positions similar to his own began to look up to him as an intellectual leader, and their correspondence with him shows remarkable interest in literary matters. In 1814, Carlyle, still looking forward to the career of a minister, obtained the mathematical mastership at Annan. The salary of £60 or £70 a year enabled him to save a little money. He went to Edinburgh once or twice, to deliver the discourses required from students of divinity. He does not seem, however, to have taken to his profession very earnestly. He was too shy and proud to see many of the Annan people, and found his chief solace in reading such books as he could get. In 1816 he was appointed, through the recommendation of Leslie, to a school at Kirkcaldy, where Edward Irving, Carlyle's senior by three years, was also master of a school. Irving's severity as a teacher had offended some of the parents, who set up Carlyle to be his rival. A previous meeting with Irving, also a native of Annan, had led to a little passage of arms, but Irving now welcomed Carlyle with a generosity which entirely won his heart, and the rivals soon became the closest of friends. The intimacy, affectionately commemorated in the *Reminiscences*, was of great importance to Carlyle's whole career. "But for Irving," he says, "I had never known what the communion of man with man means." Irving had a library, in which Carlyle devoured Gibbon and much French literature, and they made various excursions together. Carlyle did his duties as a schoolmaster punctiliously, but found the life thoroughly uncongenial. No man was less fitted by temperament for the necessary drudgery and worry. A passing admiration for a Miss Gordon is supposed to have suggested the "Blumine" of *Sartor Resartus*; but he made no new friendships, and when Irving left at the end of 1818 Carlyle also resigned his post.

He had by this time resolved to give up the ministry. He has given no details of the intellectual change which alienated him from the Church. He had, however, been led, by whatever process, to abandon the dogmatic system of his forefathers, though he was and always remained in profound sympathy with the spirit of their teaching. A period of severe struggle followed. He studied law for a time, but liked it no better than schoolmastering. He took a pupil or two, and wrote articles for the *Edinburgh Encyclopædia* under the editorship of Brewster. He occasionally visited his family, and their unflinching confidence helped to keep up his courage. Meanwhile he was going through a spiritual crisis. Atheism seemed for a time to be the only alternative to his old creed. It was, however, profoundly repugnant to him. At last, one day in June 1821, after three weeks' total sleeplessness, he went through the crisis afterwards described "quite literally" in *Sartor Resartus*. He cast out the spirit of negation, and henceforth the temper of his misery was changed to one, not of "whining," but of "indignation and grim fire-eyed defiance." That, he says, was his spiritual new-birth, though certainly not into a life of serenity. The conversion was coincident with Carlyle's submission to a new and very potent influence. In 1819 he had begun to study German, with which he soon acquired a very remark-

able familiarity. Many of his contemporaries were awakening to the importance of German thought, and Carlyle's knowledge enabled him before long to take a conspicuous part in diffusing the new intellectual light. The chief object of his reverence was Goethe. In many most important respects no two men could be more unlike; but, for the present, Carlyle seems to have seen in Goethe a proof that it was possible to reject outworn dogmas without sinking into materialism. Goethe, by singularly different methods, had emerged from a merely negative position into a lofty and coherent conception of the universe. Meanwhile, Carlyle's various anxieties were beginning to be complicated by physical derangement. A rat, he declared, was gnawing at the pit of his stomach. He was already suffering from the ailments, whatever their precise nature, from which he never escaped. He gave vent to his irritability by lamentations so grotesquely exaggerated as to make it difficult to estimate the real extent of the evil.

THOMAS CARLYLE.

(From a photograph by Elliott and Fry, London.)

Irving's friendship now became serviceable. Carlyle's confession of the radical difference of religious opinion had not alienated his friend, who was settling in London, and used his opportunities for promoting Carlyle's interest. In January 1822, Carlyle, through Irving's recommendation, became tutor to Charles and Arthur Buller, who were to be students at Edinburgh. Carlyle's salary was £200 a year, and this, with the proceeds of some literary work, enabled him at once to help his brother John to study medicine and his brother Alexander to take up a farm. Carlyle spent some time with the elder Bullers, but found a life of dependence upon fashionable people humiliating and unsatisfactory. He employed himself at intervals upon a life of Schiller and a translation of *Wilhelm Meister*. He received £50 for a translation of Legendre's *Geometry*; and an introduction, explaining the theory of proportion, is said by De Morgan to show that he could have gained distinction as an expounder of mathematical principles. He finally gave up his tutorship in July 1824, and for a time tried to find employment in London. The impressions made upon him by London men of letters were most unfavourable. Carlyle felt by this time conscious of having

a message to deliver to mankind, and his comrades, he thought, were making literature a trade instead of a vocation, and prostituting their talents to frivolous journalism. He went once to see Coleridge, who was then delivering his oracular utterances at Highgate, and the only result was the singularly vivid portrait given in a famous chapter in his life of Sterling. Coleridge seemed to him to be ineffectual as a philosopher, and personally to be a melancholy instance of genius running to waste. Carlyle, conscious of great abilities, and impressed by such instances of the deleterious effects of the social atmosphere of London, resolved to settle in his native district. There he could live frugally and achieve some real work. He could, for one thing, be the interpreter of Germany to England. A friendly letter from Goethe, acknowledging the translation of *Wilhelm Meister*, reached him at the end of 1824 and greatly encouraged him. Goethe afterwards spoke warmly of the life of Schiller, and desired it to be translated into German. Letters occasionally passed between them in later years, which were edited by Professor Norton in 1887. Goethe received Carlyle's homage with kind complacency. The gift of a seal to Goethe on his birthday in 1831 "from fifteen English friends," including Scott and Wordsworth, was suggested and carried out by Carlyle. The interest in German, which Carlyle did so much to promote, suggested to him other translations and reviews during the next few years, and he made some preparations for a history of German literature. British curiosity, however, about such matters seems to have been soon satisfied, and the demand for such work slackened.

Carlyle was meanwhile passing through the most important crisis of his personal history. Jane Baillie Welsh, born 1801, was the only child of Dr Welsh of Haddington. She had shown precocious talent, and was sent to the school at Haddington where Irving was a master. After her father's death in 1819 she lived with her mother, and her wit and beauty attracted many admirers. Her old tutor, Irving, was now at Kirkcaldy, where he became engaged to a Miss Martin. He visited Haddington occasionally in the following years, and a strong mutual regard arose between him and Miss Welsh. They contemplated a marriage, and Irving endeavoured to obtain a release from his previous engagement. The Martin family held him to his word, and he took a final leave of Miss Welsh in 1822. Meanwhile he had brought Carlyle from Edinburgh and introduced him to the Welshes. Carlyle was attracted by the brilliant abilities of the young lady, procured books for her, and wrote letters to her as an intellectual guide. The two were to perform a new variation upon the theme of Abelard and Héloïse. It is, however, difficult to speak with confidence of the precise character of their relations. The letters which contain the necessary information have been read by no one except Carlyle's biographer, Froude, and Professor Norton. Professor Norton (in his edition of Carlyle's *Early Letters*, 1886) declares that Froude had distorted the significance of this correspondence in a sense injurious to the writers. He gives significant instances of misconception, and the presumption is certainly not in favour of Froude's accuracy. According to Professor Norton, Miss Welsh's previous affair with Irving had far less importance than Froude ascribes to it; and she soon came to regard her past love as a childish fancy. She recognized Carlyle's vast intellectual superiority, and the respect gradually deepened into genuine love. The process, however, took some time. Her father had bequeathed to her his whole property (£200 to £300 a year). In 1823 she made it over to her mother, but left the whole to Carlyle in the event of her own and her mother's death. She still declared that she did not love him well enough to become his wife. In 1824 she

gradually relented so far as to say that she would marry if he could achieve independence. She had been brought up in a station superior to that of the Carlyles, and could not accept the life of hardship which would be necessary in his present circumstances. Carlyle, accustomed to his father's household, was less frightened by the prospect of poverty. He was determined not to abandon his vocation as a man of genius by following the lower though more profitable paths to literary success, and expected that his wife should partake the necessary sacrifice of comfort. The natural result of such discussions followed. The attraction became stronger on both sides, in spite of occasional spasms of doubt. An odd incident precipitated the result. A friend of Irving's, Mrs Basil Montague, wrote to Miss Welsh, to exhort her to suppress her love for Irving, who had married Miss Martin in 1823. Miss Welsh replied by announcing her intention to marry Carlyle; and then told him the whole story, of which he had previously been ignorant. He properly begged her not to yield to the impulse without due consideration. She answered by coming at once to his father's house, where he was staying; and the marriage was finally settled. It took place on 17th October 1826.

Carlyle had now to arrange the mode of life which should enable him to fulfil his aspiration. His wife had made over her income to her mother, but he had saved a small sum upon which to begin housekeeping. A passing suggestion from Mrs Carlyle that they might live with her mother was judiciously abandoned. Carlyle had thought of occupying Craigenputtock, a remote and dreary farm belonging to Mrs Welsh. His wife objected his utter incapacity as a farmer; and they finally took a small house at Comely Bank, Edinburgh, where they could live on a humble scale. The brilliant conversation of both attracted some notice in the literary society of Edinburgh. The most important connexion was with Jeffrey, still editor of the *Edinburgh Review*. Though Jeffrey had no intellectual sympathy with Carlyle, he accepted some articles for the *Review* and became warmly attached to Mrs Carlyle. Carlyle began to be known as leader of a new "mystic" school, and his earnings enabled him to send his brother John to study in Germany. The public appetite, however, for "mysticism" was not keen. In spite of support from Jeffrey and other friends, Carlyle failed in a candidature for a professorship at St. Andrews. His brother, Alexander, had now taken the farm at Craigenputtock, and the Carlyles decided to settle at the separate dwelling-house there, which would bring them nearer to Mrs Welsh. They went there in 1828, and began a hard struggle. Carlyle, indomitably determined to make no concessions for immediate profit, wrote slowly and carefully, and turned out some of his most finished work. He laboured "passionately" at *Sartor Resartus*, and made articles out of fragments originally intended for the history of German literature. The money difficulty soon became more pressing. John, whom he was still helping, was trying unsuccessfully to set up as a doctor in London; and Alexander's farming failed. In spite of such drawbacks, Carlyle in later years looked back upon the life at Craigenputtock as on the whole a comparatively healthy and even happy period, as it was certainly one of most strenuous and courageous endeavour. Though often absorbed in his work and made both gloomy and irritable by his anxieties, he found relief in rides with his wife, and occasionally visiting their relations. Their letters during temporary separations are most affectionate. The bleak climate, however, the solitude, and the necessity of managing a household with a single servant, were excessively trying to a delicate woman, though Mrs Carlyle concealed from her husband

the extent of her sacrifices. The position was gradually becoming untenable. In the autumn of 1831 Carlyle was forced to accept a loan of £50 from Jeffrey and went in search of work to London, whither his wife followed him. He made some engagements with publishers, though no one would take *Sartor Resartus*, and returned to Craigenputtock in the spring of 1832. Jeffrey, stimulated perhaps by his sympathy for Mrs Carlyle, was characteristically generous. Besides pressing loans upon both Thomas and John Carlyle, he offered to settle an annuity of £100 upon Thomas, and finally enabled John to support himself by recommending him to a medical position. Carlyle's proud spirit of independence made him reject Jeffrey's help as long as possible; and even his acknowledgment of the generosity (in the *Reminiscences*) is tinged with something disagreeably like resentment. In 1834 he applied to Jeffrey for a post at the Edinburgh Observatory. Jeffrey naturally declined to appoint a man who, in spite of some mathematical knowledge, had no special qualification, and administered a general lecture upon Carlyle's arrogance and eccentricity which left a permanent sense of injury.

In the beginning of 1833 the Carlyles made another trial of Edinburgh. There Carlyle found materials in the Advocates' Library for the article on the *Diamond Necklace*, which is one of his most perfect writings, and which led him to study the history of the French Revolution. *Sartor Resartus* was at last appearing in *Fraser's Magazine*, though the rate of payment was cut down, and the publisher reported that it was received with "unqualified dissatisfaction." Edinburgh society did not attract him, and he retreated once more to Craigenputtock. After another winter the necessity of some change became obvious. The Carlyles resolved to "burn their ships." They went to London in the summer of 1834, and took a house at 5 (now 24) Cheyne Row, Chelsea, which Carlyle inhabited till his death; the house has since been bought for the public. Irving, who had welcomed him on former occasions, was just dying,—a victim, as Carlyle thought, to fashionable cajoleries. A few young men were beginning to show appreciation. J. S. Mill had made Carlyle's acquaintance in the previous visit to London, and had corresponded with him. Mill had introduced Emerson, who visited Craigenputtock in 1833. Carlyle was charmed with Emerson, and their letters published by Professor Norton show that his regard never cooled. Emerson's interest showed that Carlyle's fame was already spreading in America. Carlyle's connexion with Charles Buller, a zealous utilitarian, introduced him to the circle of "philosophical Radicals." Carlyle called himself in some sense a Radical; and J. S. Mill, though not an intellectual disciple, was a very warm admirer of his friend's genius. Carlyle had some expectation of the editorship of the *London Review*, started by Sir W. Molesworth at this time as an organ of philosophical Radicalism. The combination would clearly have been explosive. Meanwhile Mill, who had collected many books upon the French Revolution, was eager to help Carlyle in the history which he was now beginning. He set to work at once and finished the first volume in five months. The manuscript, while entrusted to Mill for annotation, was burnt by an accident. Mill induced Carlyle to accept in compensation £100, which was urgently needed. Carlyle took up the task again and finished the whole on 12th January 1837. "I can tell the world," he said to his wife, "you have not had for a hundred years any book that comes more direct and flamingly from the heart of a loving man. Do what you like with it, you —"

The publication, six months later, of the *French Revolution* marks the turning-point of Carlyle's career.

Many readers hold it to be the best, as it is certainly the most characteristic, of Carlyle's books. The failure of *Sartor Resartus* to attract average readers is quite intelligible. It contains, indeed, some of the most impressive expositions of his philosophical position, and some of his most beautiful and perfectly written passages. But there is something forced and clumsy, in spite of the flashes of grim humour, in the machinery of the *Clothes Philosophy*. The mannerism which has been attributed to an imitation of Jean Paul appeared to Carlyle himself to be derived rather from the phrases current in his father's house, and in any case gave an appropriate dialect for the expression of his peculiar idiosyncrasy. But it could not be appreciated by readers who would not take the trouble to learn a new language. In the *French Revolution* Carlyle had discovered his real strength. He was always at his best when his imagination was set to work upon a solid framework of fact. The book shows a unique combination: on the one hand is the singularly shrewd insight into character and the vivid realization of the picturesque; on the other is the "mysticism" or poetical philosophy which relieves the events against a background of mystery. The contrast is marked by the humour which seems to combine a cynical view of human folly with a deeply pathetic sense of the sadness and suffering of life. The convictions, whatever their value, came, as he said, "flamingly from the heart." It was, of course, impossible for Carlyle to satisfy modern requirements of matter-of-fact accuracy. He could not in the time have assimilated all the materials even then extant, and later accumulations would necessitate a complete revision. Considered as a "prose epic," or a vivid utterance of the thought of the period, it has a permanent and unique value.

The book was speedily successful. It was reviewed by Mill in the *Westminster* and by Thackeray in the *Times*, and Carlyle, after a heroic struggle, was at last touching land. In each of the years 1837 to 1840 he gave a course of lectures, of which the last only (upon "Hero Worship") was published; they materially helped his finances. By Emerson's management he also received something during the same period from American publishers. At the age of forty-five he had thus become independent. He had also established a position among the chief writers of the day. Young disciples, among whom John Sterling was the most accepted, were gathering round him, and he became an object of social curiosity. Monckton Milnes, who won universal popularity by the most genuine kindness of nature, became a cordial friend. Another important intimacy was with the Barings, afterwards Lord and Lady Ashburton. Carlyle's conversational powers were extraordinary; though, as he won greater recognition as a prophet, he indulged too freely in didactic monologue. In his prophetic capacity he published two remarkable books: *Chartism* (1829), enlarged from an article which Lockhart, though personally approving, was afraid to take for the *Quarterly*; and *Past and Present* (1843), in which the recently published *Medieval Chronicle* was taken as a text for the exposure of modern evils. They may be regarded as expositions of the doctrine implicitly set forth in the *French Revolution*. Carlyle was a "Radical" as sharing the sentiments of the class in which he was born. He had been profoundly moved by the widely-spread distresses in his earlier years. When the yeomanry were called out to suppress riots after the Peace, his sympathies were with the people rather than with the authorities. So far he was in harmony with Mill and the "philosophical Radicals." A fundamental divergence of principle, however, existed and was soon indicated by his speedy separation from the party and alienation from Mill himself. The Revolution, according to him, meant the sweeping away of effete beliefs

and institutions, but implied also the necessity of a reconstructive process. *Chartism* begins with a fierce attack upon the *laissez faire* theory, which showed blindness to this necessity. The prevalent political economy, in which that theory was embodied, made a principle of neglecting the very evils which it should be the great function of government to remedy. Carlyle's doctrines, entirely opposed to the ordinary opinions of Whigs and Radicals, found afterwards an expositor in his ardent disciple Ruskin, and have obvious affinities with more recent socialism. At the time he was as one crying in the wilderness to little practical purpose. Liberals were scandalized by his apparent identification of "right" with "might," implied in the demand for a strong government; and though he often declared the true interpretation to be that the right would ultimately become might, his desire for strong government seemed too often to sanction the inverse view. He came into collision with philanthropists, and was supposed to approve of despotism for its own sake.

His religious position was equally unintelligible to the average mind. While unequivocally rejecting the accepted creeds, and so scandalizing even liberal theologians, he was still more hostile to simply sceptical and materialist tendencies. He was, as he called himself, a "mystic"; and his creed was too vague to be put into any formula beyond a condemnation of atheism. One corollary was the famous doctrine of "hero worship" first expounded in his lectures. Any philosophy of history which emphasized the importance of general causes seemed to him to imply a simply mechanical doctrine, and to deny the efficacy of the great spiritual forces. He met it by making biography the essence of history, or attributing all great events to the "heroes," who are the successive embodiments of divine revelations. This belief was implied in his next great work, the *Life and Letters of Oliver Cromwell*, published in 1845. The great Puritan hero was a man after his own heart, and the portrait drawn by so sympathetic a writer is not only intensely vivid, but a very effective rehabilitation of misrepresented character. The "biographical" view of history, however, implies the weakness, not only of unqualified approval of all Cromwell's actions, but of omitting any attempt to estimate the Protector's real relation to the social and political development of the time. The question, what was Cromwell's real and permanent achievement, is not answered nor distinctly considered. The effect may be partly due to the peculiar form of the book as a detached series of documents and comments. The composition introduced Carlyle to the "Dryasdust" rubbish heaps of which he here and ever afterwards bitterly complained. A conscientious desire to unearth the facts, and the effort of extracting from the dullest records the materials for graphic pictures, made the process of production excessively painful. For some years after *Cromwell* Carlyle wrote little. His growing acceptance by publishers, and the inheritance of her property by Mrs Carlyle on her mother's death in 1842, finally removed the stimulus of money pressure. He visited Ireland in 1846 and again in 1849, when he made a long tour in company with Sir C. Gavan Duffy, then a young member of the Nationalist party (see Sir C. G. Duffy's *Conversations with Carlyle*, 1892, for an interesting narrative). Carlyle's strong convictions as to the misery and misgovernment of Ireland recommended him to men who had taken part in the rising of 1848. Although the remedies acceptable to a eulogist of Cromwell could not be to their taste, they admired his moral teaching; and he received their attentions, as Sir C. G. Duffy testifies, with conspicuous courtesy. His aversion from the ordinary Radicalism led to an article upon slavery in 1849, to which Mill replied, and which caused their final alienation. It was followed in 1850 by

the *Latterday Pamphlets*, containing "sulphurous" denunciations of the do-nothing principle. They gave general offence, and the disapproval, according to Froude, stopped the sale for years. The *Life of Sterling* (died 1844), which appeared in 1851, was intended to correct the life by Julius Hare, which had given too much prominence to the theological questions. The subject roused Carlyle's tenderest mood, and the *Life* is one of the most perfect in the language.

Carlyle meanwhile was suffering domestic troubles, unfortunately not exceptional in their nature, though the exceptional intellect and characters of the persons concerned have given them unusual prominence. Carlyle's constitutional irritability made him intensely sensitive to petty annoyances. He suffered the torments of dyspepsia; he was often sleepless, and the crowing of "demon-fowls" in neighbours' yards drove him wild. Composition meant for him intense absorption in his work; solitude and quiet were essential; and he resented interruptions by grotesque explosions of humorously exaggerated wrath. Mrs Carlyle had to pass many hours alone, and the management of the household and of devices intended to shield him from annoyances was left entirely to her. House-cleanings and struggles with builders during the construction of a "sound-proof room" taxed her energy, while Carlyle was hiding himself with his family in Scotland or staying at English country houses. Nothing could be more affectionate than his behaviour to his wife on serious occasions, such as the death of her mother, and he could be considerate when his attention was called to the facts. But he was often oblivious of the strain upon her energies, and had little command of his temper. An unfortunate aggravation of the difficulty arose from his intimacy with the Ashburtons. Lady Ashburton, a woman of singular social charm and great ability, appreciated the author, but apparently accepted the company of the author's wife rather as a necessity than as an additional charm. Mrs Carlyle was hurt by the fine lady's condescension and her husband's accessibility to aristocratic blandishments. Carlyle, as a wise man, should have yielded to his wife's wishes; unluckily, he was content to point out that her jealousy was unreasonable and, upon that very insufficient ground, to disregard it and to continue his intimacy with the Ashburtons on the old terms. Mrs Carlyle bitterly resented his conduct. She had been willing to renounce any aspirations of her own and to sink herself in his glory, but she naturally expected him to recognize her devotion and to value her society beyond all others. She had just cause of complaint, and a remarkable power, as her letters prove, of seeing things plainly and despising sentimental consolations. She was childless, and had time to brood over her wrongs. She formed a little circle of friends, attached to her rather than to her husband; and to one of them, Mazzini, she confided her troubles in 1846. He gave her admirable advice; and the alienation from her husband, though it continued still to smoulder, led to no further results. A journal written at the same time gives a painful record of her sufferings, and after her death made Carlyle conscious for the first time of their full extent. The death of Lady Ashburton in 1857 removed this cause of jealousy; and Lord Ashburton married a second wife in 1858, who became a warm friend of both Carlyles. The cloud which had separated them was thus at last dispersed. Meanwhile Carlyle had become absorbed in his best and most laborious work. Soon after the completion of the *Cromwell* he had thought of Frederick for his next hero, and had in 1845 contemplated a visit to Germany to collect materials. He did not, however, settle down finally to the work till 1851. He shut himself up in his study to wrestle with the Prussian Dryasdusts, whom

he discovered to be as wearisome as their Puritan predecessors and more voluminous. He went to Scotland to see his mother, to whom he had always shown the tenderest affection, on her deathbed at the end of 1853. He returned to shut himself up in the "sound-proof room." He twice visited Germany (1852 and 1858), to see Frederick's battlefields and obtain materials; and he occasionally went to the Ashburtons and his relations in Scotland. The first two volumes of *Frederick the Great* appeared in 1858, and succeeding volumes in 1862, 1864, and 1865. The success was great from the first, though it did little to clear up Carlyle's gloom. The book is in some respects his masterpiece, and its merits are beyond question. Carlyle had spared no pains in research. The descriptions of the campaigns are admirably vivid, and show his singular eye for scenery. These narratives are said to be used by military students in Germany, and at least convince the non-military student that he can understand the story. The book was declared by Emerson to be the wittiest ever written. Many episodes, describing the society at the Prussian court and the relations of Frederick to Voltaire, are unsurpassable as humorous portraiture. The effort to fuse the masses of raw material into a well-proportioned whole is perhaps not quite successful; and Carlyle had not the full sympathy with Frederick which had given interest to the *Cromwell*. A hero-worshiper with half-concealed doubts as to his hero is in an awkward position. Carlyle's general conception of history made him comparatively blind to aspects of the subject which would, to writers of other schools, have a great importance. The extraordinary power of the book is undeniable, though it does not show the fire which animated the *French Revolution*. A certain depression and weariness of spirit darken the general tone.

During the later labours Mrs Carlyle's health had been breaking. Carlyle, now that happier relations had been restored, did his best to give her the needed comforts; and in spite of his immersion in *Frederick*, showed her all possible attention in later years. She had apparently recovered from an almost hopeless illness, when at the end of 1865 he was elected to the rectorship of the University of Edinburgh. He delivered an address there on 2nd April 1866, unusually mild in tone and received with general applause. He was still detained in Scotland when Mrs Carlyle died suddenly while driving in her carriage. The immediate cause was the shock of an accident to her dog. She had once hurt her mother's feelings by refusing to use some wax candles. She had preserved them ever since, and by her direction they were now lighted in the chamber of death. Carlyle was overpowered by the loss. His life thenceforward became more and more secluded, and he gradually became incapable of work. He went to Mentone in the winter of 1866 and began the *Reminiscences*. He afterwards annotated the letters from his life, published (1883) as *Letters and Memorials*. He was, as Froude says, impressed by the story of Johnson's "penance" at Uttoxeter, and desired to make a posthumous confession of his shortcomings in his relations to his wife. A few later utterances made known his opinions of current affairs. He joined the committee for the defence of Governor Eyre in 1867; he also wrote in 1867 an article upon "shooting Niagara," that is, upon the tendency of the Reform Bill of that year; and in 1870 he wrote a letter defending the German case against France. The worth of his *Frederick* was acknowledged by the Prussian Order of Merit in 1874. In the same year Disraeli offered him the Grand Cross of the Bath and a pension. He declined very courteously, and felt some regret for previous remarks upon the minister. The length of his literary career was now softening old antipathies, and he was the

object of general respect. His infirmities enforced a very retired life, but he was constantly visited by Froude, and occasionally by his disciple Ruskin. A small number of other friends paid him constant attention. His conversation was still interesting, especially when it turned upon his recollections, and though his judgments were sometimes severe enough, he never condescended to the scandalous. His views of the future were gloomy. The world seemed to be going from bad to worse, with little heed to his warnings. He would sometimes regret that it was no longer permissible to leave it in the old Roman fashion. He sank gradually, and died on 4th February 1881. A place in Westminster Abbey was offered, but he was buried, according to his own desire, by the side of his parents at Ecclefechan. He left Craigenputtock, which had become his own property, to found bursaries at the University of Edinburgh. He gave his books to Harvard College, Massachusetts.

Carlyle's appearance has been made familiar by many portraits, none of them, according to Froude, satisfactory. The statue by Boehm on the Chelsea Embankment, however, is characteristic; and there is a fine painting by Watts in the National Portrait Gallery. During Carlyle's later years the antagonism roused by his attacks upon popular opinions had subsided; and upon his death general expression was given to the emotions natural upon the loss of a remarkable man of genius. The rapid publication of the *Reminiscences* by Froude produced a sudden revulsion of feeling. Carlyle became the object of general condemnation. Froude's biography, and the *Memorials* of Mrs Carlyle, published soon afterwards, strengthened the hostile feeling. Carlyle had appended to the *Reminiscences* an injunction to his friends not to publish them as they stood, and added that no part could ever be published without the strictest editing. Afterwards, when he had almost forgotten what he had written, he verbally empowered Froude to use his own judgment: Froude accordingly published the book at once, without any editing, and with many inaccuracies. Omissions of a few passages written from memory at a time of profound nervous depression would have altered the whole character of the book. Froude in this and the later publications held that he was giving effect to Carlyle's wish to imitate Johnson's "penance." No one, said Boswell, should persuade him to make his lion into a cat. Froude intended, in the same spirit, to give the shades as well as the lights in the portrait of his hero. His admiration for Carlyle probably led him to assume too early that his readers would approach the story from the same point of view, that is, with an admiration too warm to be repelled by the admissions. Moreover, Froude's characteristic desire for picturesque effect, unchecked by any painstaking accuracy, led to his reading preconceived impressions into his documents. The result was that Carlyle was too often judged by his defects, and regarded as a selfish and eccentric misanthrope with flashes of genius, rather than as a man with many of the highest qualities of mind and character clouded by constitutional infirmities. Yet it would be difficult to speak too strongly of the great qualities which underlay the superficial defects. Through long years of poverty and obscurity Carlyle showed unsurpassed fidelity to his vocation and superiority to the lower temptations which have ruined so many literary careers. His ambition might be interpreted as selfishness, but certainly showed no coldness of heart. His unstinted generosity to his brothers during his worst times is only one proof of the singular strength of his family affections. No one was more devoted to such congenial friends as Irving and Sterling. He is not the only man whom absorption in work and infirmity of temper have made into a provoking husband, though few

wives have had Mrs Carlyle's capacity for expressing the sense of injustice. The knowledge that the deepest devotion underlies misunderstandings is often a very imperfect consolation; but such devotion clearly existed all through, and proves the defect to have been relatively superficial.

The harsh judgments of individuals in the *Reminiscences* had no parallel in his own writings. He scarcely ever mentions a contemporary, and was never involved in a personal controversy. But the harshness certainly reflects a characteristic attitude of mind. Carlyle was throughout a pessimist or a prophet denouncing a backsliding world. His most popular contemporaries seemed to him to be false guides, and charlatans had ousted the heroes. The general condemnation of "shams" and cant had, of course, particular applications, though he left them to be inferred by his readers. Carlyle was the exponent of many of the deepest convictions of his time. Nobody could be more in sympathy with aspirations for a spiritual religion and for a lofty idealism in political and social life. To most minds, however, which cherish such aspirations the gentler optimism of men like Emerson was more congenial. They believed in the progress of the race and the triumph of the nobler elements. Though Carlyle, especially in his earlier years, could deliver an invigorating and encouraging, if not a sanguine doctrine, his utterances were more generally couched in the key of denunciation, and betrayed a growing despondency. Materialism and low moral principles seemed to him to be gaining the upper hand; and the hope that religion might survive the "old clothes" in which it had been draped seemed to grow fainter. The ordinary mind complained that he had no specific remedy to propose for the growing evils of the time; and the more cultivated idealist was alienated by the gloom and the tendency to despair. To a later generation it will probably appear that, whatever the exaggerations and the misconceptions to which he was led, his vehement attacks at least called attention to rather grave limitations and defects in the current beliefs and social tendencies of the time. The mannerisms and grotesque exaggerations of his writings annoyed persons of refinement, and suggest Matthew Arnold's advice to flee "Carlylese" as you would flee the devil. Yet the shrewd common-sense, the biting humour, the power of graphic description, and the imaginative "mysticism" give them a unique attraction for many even who do not fully sympathize with the implied philosophy or with the Puritanical code of ethics. The letters and autobiographical writings, whether they attract or repel sympathy, are at least a series of documents of profound interest for any one who cares to study character, and display an almost unique idiosyncrasy.

The chief authorities for Carlyle's life are his own *Reminiscences*, the letters of JANE WELSH CARLYLE, and the four volumes of FROUDE's *Biography*.—Prof. NORTON's edition of the *Reminiscences* and his collection of Carlyle's *Early Letters* correct some of Froude's inaccuracies.—A list of many articles upon Carlyle is given by Mr IRELAND in *Notes and Queries*, sixth series, vol. iv.—Among other authors may be noticed HENRY JAMES, sen., in *Literary Remains*.—Prof. MASSON. *Carlyle, Personally and in his Writings*.—CONWAY. *Thomas Carlyle*.—LARKIN. *The Open Secret of Carlyle's Life*.—Mrs OLIPHANT in *Macmillan's Magazine* for April 1881.—G. S. VENABLES in *Fortnightly Review* for May 1883 and November 1884. (L. S.)

Carmarthen, a municipal borough (extended 1898), contributory parliamentary borough (uniting with Llanelli), and county town of Carmarthenshire, Wales, 32 miles N.W. of Swansea by rail, on the Towy, about 5 miles from the sea. The borough forms a county of itself. Recent erections are a chapel of ease and a Masonic hall; the county and borough infirmary has been extended. Iron-founding, woollen manufacture, tanning,

and rope-making are carried on. Population (1881), 10,514; (1901), 9935. There is a parish of Carmarthen.

Carmarthenshire, a maritime county of South Wales, bounded on the N. by Cardigan, on the E. by Brecon and Glamorgan, on the S. by Carmarthen Bay, and on the W. by Pembroke.

Area and Population.—The area of the ancient and the administrative county, as given in the census returns, is 587,816 acres, or 918 square miles. The population in 1881 was 124,864, and in 1891 was 130,566, of whom 62,316 were males and 68,250 females; the number of persons per square mile being 142, and of acres to a person 4.50. In 1901 the population was 135,325. The area of the registration county is 478,717 acres, with a population in 1891 of 118,624. Within this area the percentage of increase between 1881 and 1891 was 6.62. Between 1881 and 1891 the excess of births over deaths was 15,234, and the increase in the resident population was 7369. The following table gives the numbers of marriages, births, and deaths, with the number and percentage of illegitimate births, for 1880, 1890, and 1898:—

Year.	Marriages.	Births.	Deaths.	Illegitimate Births.	
1880	767	3702	2338	190	5.1
1890	767	3647	2143	156	4.3
1898	861	3540	2328	130	3.7

In 1891 the natives of Scotland in the county numbered 232, the natives of Ireland 343, and foreigners 191; while 1751 persons could speak English, 63,345 Welsh, and 36,937 English and Welsh.

Constitution and Government.—The county is divided into two parliamentary divisions, and it also includes the Carmarthen district of parliamentary boroughs, consisting of Carmarthen and Llanelli. There are three municipal boroughs: Carmarthen (1935), Kidwelly (2285), and Llandovery (1809). The urban districts are Llandilo (1934), Llanelli (25,553), and Newcastle Emlyn (855). The county is in the South Wales circuit, and assizes are held at Carmarthen. The borough of Carmarthen has a commission of the peace and a separate court of quarter sessions. The ancient county, which is in the diocese of St. Davids, contains 75 entire ecclesiastical parishes and districts, and parts of one other.

Education.—There is a residential training college for schoolmasters (National Society's) at Carmarthen, and at Llanelli there is a board school for deaf children. The number of elementary schools on 31st August 1899 was 166, of which 100 were board and 66 voluntary schools, the latter including 54 National Church of England Schools, 2 Roman Catholic, and 10 "British and other." The average attendance at board schools was 14,592, and at voluntary schools 6421. The total school board receipts for the year ending 29th September 1899 were over £64,909. The income under the Agricultural Rates Act was over £2849.

Agriculture.—About three-fourths of the total area of the county is under cultivation, and of this about three-fourths is in permanent pasture. There are also over 47,000 acres in mountain pasture, and over 23,000 under woods. More than half the acreage under corn crops is occupied by oats, about one-fourth by barley, and more than one-sixth by wheat. About one-half of the green crop acreage is occupied by turnips and swedes, and more than one-third by potatoes. The chief attention of the farmer is devoted to stock raising and dairy farming. The following table gives the larger main divisions of the cultivated area at intervals of five years from 1880:—

Year.	Total area under Cultivation.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	429,000	67,265	10,079	41,592	307,610	2454
1885	441,108	63,258	10,601	37,207	327,819	2223
1890	445,775	60,205	10,806	30,370	342,932	1436
1895	441,325	56,557	10,114	29,855	343,994	744
1900	442,109	52,333	10,191	33,915	344,772	889

The following table gives particulars regarding the principal live stock for the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or in Calf.	Sheep.	Pigs.
1880	19,091	106,835	48,771	194,890	25,103
1885	19,419	115,834	51,855	213,091	30,146
1890	20,791	116,793	52,403	243,155	36,558
1895	21,703	115,564	51,734	234,606	39,644
1900	22,172	123,361	51,809	271,869	36,514

Industries and Trade.—According to the report of the chief inspector of factories for 1898 (1900), the number of persons employed in factories and workshops in 1897 was 9728, as compared with 9805 in 1896. Of the 7829 persons employed in non-textile factories, 5068 were employed in the founding and conversion of metals. Of the 1200 persons employed in 1897 in workshops, the majority were employed in the clothing industry. The total number of persons employed in mines and quarries in 1899 was 5362. Good limestone is plentiful in the southern part of the county, no fewer than 110,066 tons being raised in 1899. In the same year 67,926 tons of sandstone were raised. Within recent years little or no ironstone has been dug. The output of fireclay is increasing, as also is that of lead (1933 tons, valued at £7683, in 1899). Coal is the principal mineral, and its production is increasing. The following table gives the tonnage and value of the production in 1890 and 1899 :—

Year.	Tons.	Value.
1890	762,032	£333,389
1899	1,207,205	£421,612

The total value of fish landed at Llanelly in 1899, including shell-fish, was £979.

AUTHORITIES.—SPURELL. *Carmarthen and its Neighbourhood*, Carmarthen, 1860, 2nd ed., 1879.—CURTIS. *The Antiquities of Carmarthenshire*. London, 1880.—*The Carmarthenshire Miscellany, and Notes and Queries for South-West Wales*. See also the various guide-books to South Wales. (T. F. H.)

Carmaux, a town and railway station in the arrondissement of Albi, department of Tarn, France, 10 miles N. of Albi, on a tributary of the Aveyron. The town gives its name to an important coal-basin, with an output in 1899 of 750,790 tons (metric) and employing over 3800 workpeople. The manufacture of glass is an important industry. Population (1881), 5744; (1891), 8087; (1896), 7899, (comm.) 9993; (1901), 10,948.

Carmignano, a town of the province of Florence, Tuscany, Italy, 13 miles N. by W. from Florence, the ancient *Carminianum*. Over 4000 of its people are engaged in making straw hats and straw plait. Population, about 11,000.

Carmona, a town of Spain in the province of Seville, with a railway station on the line from Cordova to Seville. Population (1897), 18,478. On a large tract of land near the Seville road excavations have been made that led to the discovery of a very important example of a Roman necropolis, lying between two Roman roads, enough curiosities being found to fill a local museum founded by the Carmona Archæological Society. In 1886, near the necropolis, an amphitheatre and more tombs were found, chiefly of the early Christian centuries. These remarkable remains are fully described in the work of Señor Rada, with illustrations by Mr Bonsor, published in 1886 under the title of *Necropolis of Carmona*, and in that of Señor Sales y Ferré (1887) styled *Estudios arqueológicos e históricos*.

Carnarvon, Henry Howard Molyneux Herbert, 4th EARL OF (1831-1890), was born on 24th June 1831. He succeeded to the title in 1849, and soon after taking his degree began to play a prominent part in the deliberations of the House of Lords. In 1858 he was Under Secretary for the Colonies, and in 1866 Secretary of State. In this capacity he introduced in 1867 the Bill for the federation of the British North American provinces which set so many political problems at rest; but he had not the privilege of passing it, having, before the measure became law, resigned, owing to his distaste for Mr Disraeli's Reform Bill. Resuming office in 1874, he endeavoured to confer a similar boon on South Africa, but the times were not ripe, and he was singularly unfortunate in his principal agent, Mr Froude. In 1878 he again resigned, out of opposition to Lord Beaconsfield's policy on the Eastern Question; but on his party's return to power in 1885 he became Lord-Lieutenant of Ireland. His short period of office, memorable for a conflict on a question of

personal veracity between himself and Mr Parnell as to his negotiations with the latter in respect of Home Rule, was terminated by another premature resignation. He never returned to office, and died on 29th June 1890. As a statesman his career was marred by extreme sensitiveness; but he was beloved as a man of worth and admired as a man of culture. He was high steward of the University of Oxford, and president of the Society of Antiquaries.

Carnarvon, a municipal and parliamentary borough, seaport, market town, and county town of Carnarvonshire, Wales, just within the western entrance of the Menai Strait, 248 miles by rail N.W. of London. The castle has recently been restored by order of the Government. The guildhall dates from 1874. The literary institute, with free library, was erected in 1884. In the market-place is a statue (1888) to Sir Hugh Owen, a distinguished promoter of Welsh education. The Pavilion will seat 8000 persons. Three of the weekly newspapers are in the Welsh language. Vessels entering port in 1888—1667 of 123,439 tons, clearances, 1511 of 116,784 tons; in 1898—total entrances, 2020 of 146,261 tons; total clearances, 1965 of 145,297 tons. The total exports of the produce and manufactures of the United Kingdom in 1898 amounted to the value of £152,468, against £186,386 in 1888. Area of municipal borough, 2214 acres; population (1881), 10,258; (1901), 9760.

Carnarvonshire, a maritime county of North Wales, bounded on the N.W. by Menai Strait, separating it from Anglesey, and by Beaumaris Bay, on the E. by Denbigh (where is also a small detached portion), on the S.E. by Merioneth, on the S. by Cardigan Bay, and on the S.W. by Carnarvon Bay.

Area and Population.—The area of the ancient county is 361,097 acres, or 564 square miles. The population in 1881 was 119,349, and in 1891 was 118,204, of whom 56,496 were males and 61,708 females, the number of persons per square mile being 210, and of acres to a person 3.05. In 1901 the population was 126,835. The area of the administrative county, as given in the census returns of 1891, was 360,138 acres, with a population of 117,233, but in 1895 a small addition was made to the administrative area by the transference to Carnarvon of the part of the parish of Beddgelert in Merioneth. The area of the registration county is 372,135 acres, with a population in 1891 of 125,585. Within this area the increase of population between 1881 and 1891 was only 1.44 per cent., while within the ancient county area there was an actual decrease of 0.9 per cent. Within the registration area the excess of births over deaths was 10,244, and the decrease in resident population was 1785. The following table gives the numbers of marriages, births, and deaths, with the number and percentage of illegitimate births, for 1880, 1890, and 1898 :—

Year.	Marriages.	Births.	Deaths.	Illegitimate Births.	
				No.	Per cent.
1880	808	3756	2481	214	5.7
1890	837	3040	2266	229	7.5
1899	1106	3419	2483	214	6.2

In 1891 there were in the county 421 natives of Scotland, 630 natives of Ireland, and 244 foreigners, while 12,604 persons could speak English, 78,780 Welsh, and 28,330 English and Welsh.

Constitution and Government.—The ancient county is divided into two parliamentary divisions, and it also includes the Carnarvon district of boroughs, consisting of Bangor city, Carnarvon, Conway, Criccieth, Nevin, and Pwllheli. There are four municipal boroughs—Bangor (11,269), Carnarvon (9725), Conway (4636), and Pwllheli (3675). The following are urban districts :—Bethesda (5271), Bettws-y-coed (881), Criccieth (1410), Llandudno (9307), Llanfairfechan (2768), Penmaenmawr (3501), and Ynyscynhaiarn (4883). Carnarvon is in the North Wales circuit, and assizes are held there. The borough of Carnarvon has a separate commission of the peace, but no separate court of quarter sessions. The ancient county—which is chiefly in the diocese of Bangor, with a few parishes in that of St Asaph—contains 61 entire ecclesiastical parishes or districts, and parts of four others.

Education.—Bangor is the seat of the University College of

North Wales, in connexion with which there is a day training college for schoolmasters and schoolmistresses. There are also in the city a residential college (British and Foreign School Society's) for schoolmasters, and another (North Wales Church of England) for schoolmistresses. The total number of elementary schools on 31st August 1899 was 127, of which 62 were board and 65 were voluntary schools, the latter including 57 National Church of England schools, 2 Roman Catholic, and 6 "British and other." The average attendance at board schools was 8953, and at voluntary schools 7611. The total school board receipts for the year ending 29th September 1899 were over £39,044. The income under the Agricultural Rates Act was over £1135.

Agriculture.—Only a little more than half of the total area of the county is under cultivation, and of this area nearly two-thirds is in permanent pasture. There are, moreover, more than 114,000 acres in hill pasture and nearly 13,000 acres under woods. The chief attention of the farmer is devoted to dairy farming and the rearing of sheep. The principal corn crops are oats and barley, the former occupying nearly two-thirds, and the latter nearly one-third of the corn acreage. More than one-half of the acreage under green crops is occupied by potatoes, and about three-eighths by turnips. The following table gives the acreages of the larger main divisions of the cultivated area at intervals of five years from 1880:—

Year.	Total Area under Cultivation.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	187,351	20,445	7,949	32,178	125,803	976
1885	187,283	20,250	8,601	33,508	124,763	161
1890	193,840	21,121	10,147	26,255	136,064	208
1895	191,969	19,181	8,780	29,136	134,607	192
1900	182,395	16,878	8,066	41,282	115,880	209

The following table gives particulars regarding the principal live-stock for the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or in Calf.	Sheep.	Pigs.
1880	8241	51,168	21,765	213,458	16,899
1885	8271	53,623	21,861	204,733	20,023
1890	8724	58,094	22,961	233,332	26,747
1895	8674	54,320	22,342	235,707	24,080
1900	9435	57,357	23,659	269,692	19,028

Industries and Trade.—According to the annual report for 1898 of the chief inspector of factories (1900), the total number of persons employed in factories and workshops in 1897 was 3302, as compared with 3231 in 1896. Of these, 1259 were employed in workshops (the majority in clothing industries), and 1891 in non-textile factories. The total number of persons employed in mines and quarries in 1899 was 13,344. The slate quarries are of great importance, the two largest workings being the Penrhyn quarry near Bangor and the Dinorwic quarry near Carnarvon. In 1899 418,821 tons of limestone were raised, and 413,109 tons of "igneous rocks other than granite." The output of both copper and zinc has very greatly decreased; that of lead is extremely variable—198 tons in 1885, 1116 tons valued at £10,101 in 1890, and 608 tons in 1899. The following table gives particulars regarding the slate production in 1890 and 1899:—

Year.	Tons.	Value.
1890 . . .	265,157	£539,085
1899 . . .	309,426	£944,796

At Pwllheli, Carnarvon, and Bangor (including Llanfairfechan, Aber, Beaumaris, and Menai), 18,246 cwt. of fish, valued at £24,833, were landed in 1899, the total value, including shellfish, being £29,372.

(T. F. H.)

Carnegie, Andrew (1837—), American manufacturer and philanthropist, was born in Dunfermline, Scotland, 25th November 1837. In 1848 his family removed to America, and settled in Pittsburg, Pa. At an early age the boy was put to work, first in charge of a small stationary engine, later as telegraph messenger, operator, or clerk, and for a while was superintendent of a division of the Pennsylvania Railroad. He laid the foundation of his fortune in the introduction of sleeping cars and in the purchase of oil-wells. With others he

established a rolling-mill, out of which grew the various companies for the manufacture of iron and steel, known collectively as the Carnegie companies, probably the largest and most complete works of the kind in the world. In 1901 these were amalgamated with others in a great Steel Trust, Mr Carnegie retiring with a fortune estimated at nearly £100,000,000. He has given immense sums for charitable objects, but chiefly for education and the building of libraries, one of his largest gifts being that to New York city. In 1901 he gave about £2,000,000 to the universities of Scotland, and established a trust to administer the fund, one half of the income to be devoted to the payment of the fees of Scottish students, and the other half to buildings, apparatus, professorships, research, &c. In 1902 he gave \$10,000,000 to found the Carnegie Institution in Washington, U.S.A., to "encourage investigation, research, and discovery." He is author of *Triumphant Democracy*, *An American Four-in-Hand in Britain*, and other books.

Carnegie, a borough of Allegheny county, Pennsylvania, U.S.A., a few miles S.W. of Pittsburg. It is devoted to iron smelting and manufacture, and has been built up entirely in recent years. Population (1900), 7330.

Carnières, a town of Belgium, in the province of Hainaut, 15 miles E. of Mons, with a station on the railway from Mons to Charleroi. It has quarries of building stone. Population (communal) (1880), 5787; (1901), 7328.

Carniola (German, *Krain*), a duchy and crownland in the Cisleithan half of the Austro-Hungarian monarchy. Population (1869), 463,273; (1880) 481,243; (1890) including garrison of 2264 men, 498,958 (equivalent to 129.36 inhabitants per square mile); (1900) 508,348. Proportion of females to males, 1096 to 1000; 94 per cent. Slovene, 5.66 German, the rest Serbo-Croatians and Italians; 99 per cent. Roman Catholic, 1 per cent. Protestant. In 1896 the marriage-rate was 7; the birth-rate, 36.43, or, excluding still-births, 35.69; and the death-rate, 30.11 per thousand. Of the births 6.9 per cent. were illegitimate. Carniola sends 11 members to the Reichsrath. The Diet is composed of 26 Slovenes and 11 Germans. There are 5 gymnasias, 330 elementary schools, and about 30 other educational establishments. The proportion of illiterates in 1890, 33.5 per cent., shows an improvement of 12 per cent. on 1880. The Slovene members of the Reichsrath, partly on political grounds, vigorously promote the educational requirements of their nationality. The fall of the Windischgrätz coalition ministry in 1895 was due to the grant of such an educational concession to the Slovenes in the Cilli Gymnasium. Of the 24 periodicals and newspapers published, 18 are in the Slovene and 6 in the German language. Although three-fourths of the population are engaged in agriculture and forestry, only 14 per cent. of the land is arable, and the crops (wheat, rye, barley, maize, millet, and buckwheat) do not suffice for the needs of the province. Game and fish are plentiful. The timber trade is of considerable importance. The silk-worm is bred in the warmer districts adjoining Görz. Mercury, a monopoly of this province, is the most important mining product (882,384 metre centners in 1897); lignite, iron ore, and manganese being also produced, together with small quantities of lead and zinc ore, of a total value of £121,800. The product of the furnaces—mercury, silver, iron, lead, and zinc—amounted in value to £164,200. The textile, metal, leather, and other industries are of less importance. In 1897 Carniola had 422 kilometres of railways, 5516 kilometres of roads, and 139 kilometres of waterway, of which 55 kilometres are

only available for floating timber. There were 156 post and 71 telegraph offices, with 792 kilometres of line and 2509 kilometres of wire. The Slovenes regard the Croats as their nearest relatives and exemplars among the Slav peoples. The languages are closely related, more particularly the dialects spoken in the adjoining districts of the two countries. The so-called "Young Slovenes," still affected by the temporary unification of "Illyria," as also by the aggravation of the nationality struggle, aspire to the formation of a "Greater Croatia," uniting at least the whole Catholic section of the South Slav race. The more moderate representatives of the national sentiment content themselves with advocating the unification and autonomy of the Southern Slavs in the Cisleithan half of the monarchy. German influence in the province is now very slight and is still declining. Energetic efforts are being made to cultivate literature, science, and the drama in the Slovene language. The Dramatic Association has brought out over a hundred original and translated pieces, many of which have been produced in the subsidized Slovene theatre at Laibach. The National Literary Association, which numbers over 46,000 members, distributes a quarter of a million volumes annually, while its encouragement promotes and maintains a national periodical press, which calls forth a succession of talented young writers. The anti-German and anti-Italian feeling is very strong, and has found expression in violent demonstrations of fraternity with the Czechs and in an abortive effort to make the Russian language a subject of instruction in the public schools, preliminary to elevating it to the rank of the Panslavist medium of intercommunication.

HOFF, *Hist.-Statist.-Topogr. Gemälde von Krain* (Laibach, 1808); and DIMIRZ's historical works on the province, published at Laibach, 1874-86.

(E. O'N.)

Carnot, Marie François Sadi (1837-1894), fourth President of the French Republic, was born at Limoges on 11th August 1837. He was grandson of the famous "organizer of victory" in the first Republic, and son of Hippolyte Carnot, Minister of Public Instruction under the Provisional Government of 1848. He was educated as a civil engineer, and after having highly distinguished himself at the École Polytechnique and the École des Ponts et Chaussées, obtained an appointment in the public service. His hereditary republicanism recommended him to the Government of National Defence, by which he was entrusted in 1870 with the task of organizing resistance in the departments of the Eure, Calvados, and Seine Inférieure, and made prefect of the last named in January 1871. In the following month he was elected to the National Assembly by the department Côte d'Or. He took no prominent part in politics until August 1878, when he was appointed secretary to the Minister of Public Works. In September 1880 he became minister, and again in April 1885, passing almost immediately to the Ministry of Finance, which he held under both the Ferry and the Freycinet administrations until December 1886. When the Wilson scandals occasioned the downfall of M. Grévy in December 1887, M. Carnot's high character for integrity marked him out as a candidate for the Presidency, and he obtained the support of M. Clémenceau and of all those who objected to the candidatures of men who had been more active in the political arena, so that he was elected by 616 votes out of 827. He assumed office at a critical period, when the Republic was all but openly attacked by General Boulanger. President Carnot's ostensible part during this agitation was mainly confined to augmenting his popularity by well-timed appearances on public occasions, which gained credit for the Presidency and the Republic. When, early in 1889, Boulanger was finally

driven into exile by the energy of the Minister of the Interior, M. Constans, it fell to President Carnot's lot to appear as the head of the State on two occasions of especial interest, the celebration of the centenary of 1789, and the opening of the Paris Exhibition of that year. The perfect success of both was regarded, not unreasonably, as a popular ratification of the Republic, and though continually harassed by the formation and dissolution of ephemeral ministries, by Socialist outbreaks, and the beginnings of anti-Semitism, M. Carnot had but one serious crisis to surmount, the Panama scandals of 1892, which, if they greatly damaged the prestige of the State, increased the respect felt for its head, against whose integrity none could breathe a word. M. Carnot seemed to be arriving at the zenith of popularity, when on 24th June 1894, after delivering at a public banquet at Lyons a speech in which he appeared to imply that he nevertheless should not seek re-election, he was stabbed by an Italian anarchist named Caserio, and expired almost immediately. The horror and grief excited by this tragedy were boundless, and the President was honoured with a splendid funeral in the Panthéon, Paris. It was felt that he had been a worthy hereditary representative of the best traditions of the first Republic, and had exemplified the type of man of which the third Republic stood especially in need. If his abilities, though respectable, were not of the first order, the more credit was due to the weight of character which had so well supplied the place of genius.

(R. G.)

Carnoustie, a police burgh and summer resort of S.E. Forfarshire, Scotland, on the German Ocean, 10½ miles E.N.E. of Dundee by rail. There are various minor industries. Bathing and golfing are good. Modern erections are an Episcopal church, municipal buildings, and a Union Club. Population (1881), 3321; (1901), 5204.

Carouge. See GENEVA.

Carpathian, or KARPATHIAN MOUNTAINS.—Since 1875 the Carpathian Mountain Club, as well as individual scientific investigators, have done a good deal to add to our knowledge of this mountain system, especially from the geological standpoint. Where fully developed, the Carpathian chain consists of four zones. (1) An outer undulating foreland of soft Tertiary (Miocene) rocks, whose folds are inclined to the north and east, and overlie the ancient Russian platform. It is rich in deposits of salt (Wieleczka), mineral wax (Boryslav), and petroleum (Drohobycz), the last occurring also in the next zone. (2) A continuous sandstone zone, extending from the March to the extreme south-east, to which the name Carpathian is usually applied in the narrower sense. It corresponds to the chain of the Pre-Alps, and consists of short parallel ranges of no great height, formed mainly of Carpathian sandstone, a flysch of Cretaceous and Tertiary age. The rivers zigzag in alternate longitudinal and transverse valleys, occasionally cutting their beds in softer schistose strata. Ridges of limestone (Klippen) are prominent in the north. This zone resembles the Swiss Jura in its simple folded structure, but not in composition. (3) A crystalline zone of granites and schists intimately folded with Palæozoic and Mesozoic rocks, and rich in minerals. It is absent in the Central Carpathians. (4) A young volcanic zone, also rich in minerals, is present on the much-faulted inner side of the chain, except in the west of Transylvania. Orographically the system is divisible into—(i) The West Carpathians, a complex, roughly circular mass, about 150 miles in diameter, lying between the March and the Poprad. (ii) The simple parallel ranges of the Central or Wooded Carpathians, 60 to 70 miles broad,

"FLORA." By JEAN BAPTISTE CARPEAUX.

running south-eastwards from the Poprad for 170 miles to the Körösmező pass, between the upper Pruth and Tisza. (iii) The eastern triangular mass of the Transylvanian plateau (1575 feet), enclosed by the Eastern Carpathians (3540 feet) for 220 miles in the east, by the Transylvanian Alps (3800 feet) and Banat hills (1675 feet) for a similar distance in the south, and by the Bihar mountains (1740 feet) in the west. The granitic Great Tatra rises to 8737 feet in Gerlachfalva (Gerlsdorfer or Franz Jozef peak), and is the hydrographic centre of the West Carpathians. From it the Dunayec and Poprad flow northwards to the Vistula, across the Klippen and Sandstone ranges, and divide the Western from the Eastern Beskids. Longitudinal furrows separate the Great Tatra, Little Tatra, the Ore, and Mátra mountains. Westwards they are drained by the Vág, Gran, and Ipoly, all curving round to the Danube; and eastwards by the fault valley of the Hernád. The Fáttra, Nyitra, and Little Carpathians form a connecting link between the crystalline zones of Carpathians and Alps. The trachytic Hungarian Ore mountains form the south-western quadrant of the West Carpathians, and the Mátra and Hegyalya ranges the southern and eastern arcs. The trachytic Vihorlat range rises along the inner margin of the Wooded Carpathians, which here form the main divide. The Eastern Carpathians open in wide valleys to the south-east and south. They are crossed by the Bistritza from the crystalline zone, which reappears on their concave side, and is separated in the south from the trachytic Hargita mountains by a longitudinal valley, in which the Maros flows northwards and the Aluta southwards. Near the Tömös pass, south of the Brassó or Kronstadt basin, the sandstone range abruptly ends, and the crystalline schists of the Transylvanian Alps run westwards to the Banat mountains, where the fold axes curve to south-west and south. The Aluta breaks through them at the Roteturm pass (1155 feet) between the highest summits, Negoi (8320 feet) and Mandra (8270 feet). The Maros crosses the Transylvanian plateau and skirts the south of the Bihar mountains, which have a crystalline nucleus—possibly representing the inner portion of the West Carpathian crystalline region—surrounded by Carpathian sandstones and trachytic and other young rocks containing many minerals (Transylvanian Ore Mountains).

(A. J. HE.)

Carpeaux, Jean Baptiste (1827-1875), French sculptor, was born at Valenciennes, France, on 14th May 1827. He was the son of a mason, and passed his early life in extreme poverty. In 1842 he came to Paris, and after working for two years in a drawing-school, was admitted to the École des Beaux-Arts on 9th September 1854. The Grand Prix de Rome was awarded to his statue of "Hector bearing in his arms his son Astyanax." His first work exhibited at the Salon, in 1853, did not show the spirit of an innovator, and was very unlike the work of his master Rude. At Rome he was fascinated by Donatello, and yet more influenced by Michael Angelo, to whom he owes his feeling for vehement and passionate action. He sent from Rome a bust, "La Palombella," 1856; and a "Neapolitan Fisherman," 1858. This work was again exhibited in the Salon of 1859, and took a second-class medal; but it was not executed in marble till 1863. In his last year in Rome he sent home a dramatic group, "Ugolino and his Sons," and exhibited at the same time a "Bust of Princess Mathilde." This gained him a second-class medal and the favour of the Imperial family. In 1864 he executed the "Girl with a Shell," the companion figure to the young fisherman; and although in 1865 he did not exhibit at the Salon, busts of "Mme. A.

E. André," of "Giraud" the painter, and of "Mlle. Benedetti" showed that he was not idle. He was working at the same time on the decorations of the Pavillon de Flore, of which the pediment alone was seen at the Salon, though the bas-relief below is an even better example of his style. After producing a statue of the Prince Imperial, Carpeaux was made Chevalier of the Legion of Honour in 1866. Two years later he received an important commission to execute one of the four groups for the façade of the new Opera House. His group, representing "Dancing," 1869, was greeted with indignant protests; it is nevertheless a sound work, full of movement, with no fault but that of exceeding the limitations prescribed. In 1869 he exhibited a "Bust of M. Garnier," and followed this up with two pieces intended for his native city: a statue of Watteau, and a bas-relief, "Valenciennes repelling Invasion." During the Commune he came to England and made a "Bust of Gounod" in 1871. His last important work was a fountain for the Luxembourg Gardens, representing the "Four Quarters of the World" as four female figures. Carpeaux, though exhausted by illness, continued designing indefatigably, till he died at the Château de Bécon, near Courbevoie, on 12th October 1875, after being promoted to the higher grade of the Legion of Honour. Many of his best drawings have been presented by Prince Stirbey to the city of Valenciennes.

Carpenter, Mary (1807-1877), English educational and social reformer, was born 3rd April 1807 at Exeter, where her father, Dr Lant Carpenter, was Unitarian minister. In 1817 the family removed to Bristol, where Dr Carpenter was called to the ministry of Lewin's Mead Meeting. As a child Mary Carpenter was unusually earnest, with a deep religious vein and a remarkable thoroughness in everything she undertook. She was educated in her father's school for boys, learning Latin, Greek, and mathematics, and other subjects at that time not generally taught to girls. She early showed an aptitude for teaching, taking a class in the Sunday-school, and afterwards helping her father with his pupils. When Dr Carpenter gave up his school in 1829, his daughters opened a school for girls under Mrs. Carpenter's superintendence. In 1833 the Raja Rammohun Roy visited Bristol, and inspired Miss Carpenter with a warm interest in India; and Dr Joseph Tuckerman of Boston about the same time aroused her sympathies for the condition of destitute children. One day when she was walking with him through one of the worst Bristol slums, a wretched-looking boy rushed out of a dark entry and ran wildly past them. "That child," said her companion, "should be followed to his home and seen after." These words gave the first stimulus to what became her life-work. The first step was to help to organize, in 1835, a "Working and Visiting Society." It was a sort of district-visiting scheme, which in those days seemed a startling new departure. Miss Carpenter was its secretary for twenty years. In 1843 her interest in negro emancipation was aroused by a visit from Dr Howe. Her interest in general educational work was also growing. A Bill introduced in this year "to make provision for the better education of children in manufacturing districts," as a first instalment of a scheme of national education, failed to pass, largely owing to Nonconformist opposition, and private effort became doubly necessary. So-called "Ragged Schools" sprang up in many places, and Miss Carpenter conceived the plan of starting one in Lewin's Mead. To this was added a night-school for adults. In spite of many difficulties this was rendered a success, chiefly owing to Miss Carpenter's unwearied enthusiasm and remarkable organ-

izing power. In 1848 the closing of their own private school gave Miss Carpenter more leisure for philanthropic and literary work. She published a memoir of Dr Tuckerman and a series of articles on ragged schools which appeared in the *Inquirer*, and were afterwards collected in book form. This was followed in 1851 by *Reformatory Schools for the Children of the Perishing and Dangerous Classes, and for Juvenile Offenders*. She sketched out three classes of schools as urgently needed—(1) Good free day-schools. (2) Feeding industrial schools. (3) Reformatory schools. This book drew public attention to her work, and from that time onwards she was drawn into personal intercourse with leading thinkers and workers. She was consulted in the drafting of educational Bills, and invited to give evidence before House of Commons committees. To test the practical value of her theories, she herself started a reformatory school at Bristol, and in 1852 she published *Juvenile Delinquents, their Condition and Treatment*, which largely helped on the passing of the Juvenile Offenders Act in 1854. Now that the principle of reformatory schools was established, Miss Carpenter returned to her plea for free day-schools, contending that the ragged schools were entitled to pecuniary aid from the annual parliamentary grant. At the Oxford meeting of the British Association (1860) she read a paper on this subject, and, mainly owing to her instigation, a conference on ragged schools in relation to Government grants for education was held at Birmingham, 1861. In 1866 Miss Carpenter was at last able to carry out a long-cherished plan of visiting India, where she found herself an honoured guest. She visited Calcutta, Madras, and Bombay, inaugurated the Bengal Social Science Association, and drew up a memorial to the Governor-General dealing with female education, reformatory schools, and the state of the gaols. This visit was followed by others in 1868 and 1869. Her attempt to found a female normal school was unsuccessful at the time, owing to the inadequate previous education of the women, but afterwards such colleges were founded by Government. A start, however, was made with a model Hindu girls' school, and here she had the co-operation of native gentlemen. Her last visit to India took place in 1875, two years before her death, when she had the satisfaction of seeing many of her schemes successfully established. At the meeting of the Prison Congress in 1872 she read a paper on "Women's Work in the Reformation of Women Convicts." Her work now began to attract attention abroad. Princess Alice summoned her to Darmstadt to help to organize a Women's Congress. Thence she went to Neuchâtel to study the prison system of Dr Guillaume, and in 1873 to America, where she was enthusiastically received. Miss Carpenter watched with interest the increased activity of women during the busy 'seventies. She warmly supported the movement for their higher education, and herself signed the memorial to the University of London in favour of admitting them to medical degrees. She died at Bristol on 14th June 1877, having lived to see the accomplishment of nearly all the reforms for which she had worked and hoped.

(A. Z.)

Carpenter, William Benjamin (1813-1885), English physiologist and naturalist, was born at Exeter on 29th October 1813. He was the eldest son of Dr Lant Carpenter, the celebrated Unitarian minister, and brother of the well-known philanthropist, Mary Carpenter. His bent, like that of Huxley and Herbert Spencer, was towards engineering, but, as with Huxley in his early years, medicine was his destiny. After study under the family doctor, with whom he visited the West Indies, Carpenter attended medical classes at University College,

London, and then went to Edinburgh, where he took the degree of M.D. in 1839. The subject of his graduation thesis, "The Physiological Inferences to be Deduced from the Structure of the Nervous System of Invertebrated Animals," indicates a line of research which had fruition in his *Principles of General and Comparative Physiology*. His work in comparative neurology was recognized in 1844 by his election as a Fellow of the Royal Society, and that body awarded him a Royal medal in 1861. His appointment as Fullerian Professor of Physiology in the Royal Institution in 1845 enabled him to exhibit his powers as a teacher and lecturer, his gift of ready speech and luminous interpretation placing him in the front rank of exponents, at a time when the popularization of science was in its infancy. His manifold labours as investigator, author, editor, demonstrator, and lecturer knew no cessation through life; but in assessing the value of his work, prominence should be given to his researches in marine zoology, notably in the lower organisms, as Foraminifera and Crinoids, among the latter being the exquisite feather-star (*Comatula rosacea*), the peculiar form of the nervous system of which he discovered. These researches gave an impetus to deep-sea exploration, an outcome of which was in 1868 the *Lightning*, and, later, the more famous *Challenger*, expedition. He took a keen and laborious interest in the evidence adduced by Canadian geologists as to the organic nature of the structure known as *Eozoon Canadense*, discovered in the Laurentian strata, and at the time of his death had nearly finished a monograph on the subject, defending the now discredited theory of the animal origin of that deposit. He was an adept in the use of the microscope, and his popular treatise on that instrument has stimulated a host of observers to the use of the "added sense" with which it has endowed man. In 1856 Carpenter became Registrar of the University of London, and held the office for twenty-three years; for his services to education generally he was made a C.B. Biologist as he was, Carpenter nevertheless made reservations as to the extension of the doctrine of evolution to man's intellectual and spiritual nature. In his *Principles of Mental Physiology* he asserted both the freedom of the will and the existence of the "Ego," and one of his last public engagements was the reading of a paper in support of miracles. He died in London, from injuries occasioned by the accidental upsetting of a spirit-lamp, on 19th November 1885.

(E. CL.)

Carpets.—The artistic revival of recent years in Great Britain has had a considerable influence upon the design and colouring of carpets. The pioneer in this, as in so many other decorative reforms, was William Morris. His treatment of the Kidderminster fabric was a revelation of its possibilities, but he was perhaps scarcely so successful in his "Hammersmith" carpets, on account of the coarseness of the fabric, while he was also hampered by his self-imposed rules for colouring, by no means always in accordance with principles derived from the best work of the East. Other leading decorative artists have until lately held aloof from carpet-designing, probably deterred by its difficulties and by want of technical knowledge. Instruction on this subject had not been given at art schools, so that designs produced by students who lacked separate training under manufacturers have usually been unpractical and useless. Full information as to technical conditions is now available, and has to some extent been utilized. Several eminent decorative artists have entered the field, but while they avoid the faults of many trade productions, and while their work has much distinction and character,

it cannot on the whole be said that they have solved the problem of floor decoration. They have been confronted with the enormous difficulty of getting variety and character, while complying strictly with the axiom that a carpet should look equally well from all sides. Constantly ignoring this rule, they have simply used for carpets designs which were originally intended for walls or hangings, without any attempt to adapt them to the special requirements of a floor. The striking designs of Mr Walter Crane are free from this defect. Of many trade designs it must still be said that the more perfect the manufacturing process becomes, the more they appear to lend themselves to what is bad. At the same time many are in excellent taste, and in the all-important matter of colour great advances have been made, due almost entirely to the manufacturers, who have supplied what no school of art yet provides, namely, systematic training in colour, founded on the study of the best examples.

On the Continent of Europe the influence of *l'art nouveau* (the new style of art) has been strongly felt. In France some rather striking designs have been produced, which show a flat treatment of free-growing natural forms, but they have the fault of upward growth and, usually, of thin and washy colour. In Germany designers have gone to the wildest extremes. Everything has been sacrificed to novelty, the results being carpets which have no other quality, and which have been well described as monstrosities in design and nightmares in colour. The chief improvement in the manufacture of carpets has been the application to the power-loom of the moquette system of weaving, which, originally invented in France, was perfected in the United States, and introduced into England about the year 1877. Its essential principle, common to several types of loom, and to several fabrics called by different trade-names, such as "Royal" and "Imperial" Axminster, is as follows:—A set of long "spools" or bobbins is prepared, one for each transverse row of small squares in the design. On these spools coloured woollen threads are wound side by side, corresponding in colour and position to the design squares. The spools being fixed in series in the loom, are brought successively into position; rows of tufts (or "moquettes") are one by one cut off from the projecting ends of the threads, and inserted by suitable mechanism in a framework of simple warp and weft, thus forming a pile surface reproducing the original design. Hitherto this method of weaving has been commercially applied to narrow widths only; there are considerable mechanical and other difficulties in the way of its application to very wide looms. Another important manufacturing development has been the application of the power-loom to the weaving of seamless carpets, which have to some extent taken the place of narrow widths intended for seaming. The seamless method has been applied to Brussels and tapestry looms, but the greatest development in this direction has taken place in the patent Axminster or chenille process, and in a modification of the Kidderminster fabric known as "Roman" carpet. The products of these two processes are well known under the trade-names of "Parquet Carpets" and "Art Squares."

The importation of carpets from the East has very largely increased, and European and American influence has been brought to bear upon their design and colouring. Where the best ancient examples have been used as models, little or no harm has been done, but where attempts have been made to introduce light delicate colour schemes wholly foreign to Oriental traditions, the results have sometimes been disastrous. The manufacture of hand-knotted carpets on the Oriental plan

is still carried on in various parts of England, and has been introduced into the north-west of Ireland; but the relatively high price of labour must always prevent this industry from attaining great proportions in the United Kingdom, as compared with Germany and Austria, where it is extensively carried on. Japan has entered this field, but its products have been poor in quality and disappointingly inartistic, the best being weak copies of Persian rugs. Japanese manufacturers seem to have steadfastly set their faces in this direction, instead of developing along their own native artistic lines. The demands of the market probably account for this.

Various attempts have been made to produce the knotted fabric by power-loom. Some have been fairly successful, but none has as yet attained sufficient importance to call for more extended notice. The manufacture of carpets is very extensively carried on in America, its chief feature being the enormous extent to which the moquette system of weaving has been developed. (A. M.L.)

Carrara, an Italian town in Tuscany, province of Massa and Carrara, 5 miles from the Mediterranean coast and 34 miles by rail N.N.W. from Pisa. In the province of Carrara there are altogether 1264 quarries, of which 311 were worked at Carrara, 54 at Massa, and 106 at Versilia in 1898; the number of workmen employed in the quarries, sawmills, and polishing works being 10,155, of whom 6522 were at Carrara, 1100 at Massa, and 2533 at Versilia in the same year. In the years 1886-97 inclusive the annual output averaged 178,500 tons, of which 154,000 tons were exported (161,260 tons in 1898). The quarries are served by a mountain railway of 10 miles in length, opened in 1890, which descends from 1500 feet down to the sea. The art of carving and sculpturing is taught in the academy of fine arts and the school of design (1860). Population of town, including Avenza, its port (1881), 23,072; (1901), 26,325; of province (1881), 169,469; (1901), 195,840.

Carriages.—Before enumerating the developments which have taken place in the manufacture of carriages since 1875, we shall notice the period of transition, dating back some forty years earlier. At that time the means of travelling by road and horse-power, in the case of public coaches, had reached in England its utmost limits of speed and convenience, and the travelling-carriages of the nobility and the wealthy were equipped with the completest and most elaborate contrivances to secure personal comfort and safety. More particularly was this the case as regards Continental tours, which had become indispensable to all who had at their command the means for this costly educational and pleasurable experience. Concurrently with this development the style and character of Court equipages had also reached a consummate degree of splendour and artistic excellence. Not only was this the case in points of decoration, in which livery colour and heraldic devices were effectively employed, but also in the beauty of outline and skilful structural adaptation, in which respect carriages of that period made greater demands upon the capacity of the builder and the skill of the workman than do those of the present day. For this attainment the art of coachmaking was indebted to a very few leading men, whose genius has left its impress upon the art, and is still jealously cherished by those who in early life had experience of their achievements. The early portion of Queen Victoria's reign was an age of much emulation; the best-equipped carriages of that period, distinctive of noble families and foreign embassies, with their graceful outline and superb appointments, and harnessed to a splendid breed of horses—all harmoniously

blended, perfect in symmetry and adaptation—gave to the London season, more especially on Drawing-room days, and at other times in Hyde Park, an attractiveness unequalled in any other capital. After the death of the Prince Consort, the pageantry of that period very much declined and, except as an appendage of royalty, full-dress carriages have since been comparatively few, though there are hopes of a revival in this direction. Meanwhile, owing to the rapid development of railways and the wide extension of commerce, the demand for carriages greatly increased. The larger types gave place to others of a lighter build and more general utility, in which in some cases an infusion of American ideas made its appearance. In accordance with the universal rule of supply meeting the demand, Mr Stenson, an ironmaster of Northampton, was successful in producing a mild forging steel, which proved for some years, until the manufacture ceased, very conducive to the object of securing lightness with strength. In the early 'seventies the eminent mechanic, Sir Joseph Whitworth, in the course of his scientific studies in the perfecting of artillery, succeeded in manufacturing a steel of great purity, perfectly homogeneous and possessing marvellous tenacity and strength, known as "fluid compressed steel." Incidentally carriage-building was able to participate in the results of this discovery. Two firms well known to Sir Joseph were asked to test its merits as a material applicable to this industry. In this test much difficulty was experienced, the nature of the steel not being favourable to welding, of which so much is required in the making of coach ironwork; but after much perseverance by skilful hands this was at length accomplished, and for some years there existed not a little rivalry in the use of this material, more especially in the case of carriages on the C and under-spring principle, which for lightness, elegance, and luxurious riding left nothing to be desired. Many of these carriages may be referred to to-day as rare examples of constructive skill. Unfortunately, the original cost of the material, still more of the labour to be expended upon it, and the difficulty of educating men into the art of working it, were effectual barriers to its general adoption. The idea, however, had taken hold, and attention was given by other firms to the manufacture of the steel now in general use, admitting of easier application, with approximate, if not equal, results.

From C and under-spring carriages there arose another application of springs which was very prominently before the public during this period, by means of which it was professed that two drawbacks recognized in the C and under-spring carriages were obviated, which were caused by the perch or bar which passes under the body holding the front and hind parts in rigid connexion, and yet making use of a form of spring to which

Fig. 1.

the same terms may be applied. These objections are the weight of the perch, and the limitation which it causes to the facility of turning, which in narrow roads and crowded thoroughfares is an inconvenience. The objection to weight is, however, minimized by

the introduction of steel, and as the more advanced builders almost always construct the perch with a *forked* arch in front, allowing the wheels to pass under, the difficulty of a limited lock is in a great measure overcome (Fig. 1). It must be noted, however (and this cannot be too emphatically stated) that the so-called C springs above

Fig. 2.

referred to are not at all the same in action as the C spring proper; they are but an elongation of the ordinary elliptic spring in the form of the letter C (Fig. 2), without adding anything to, but rather lessening their elasticity, and entirely ignoring the principle of *suspension* by leather braces over the C spring proper, by which alone the advantage of superior ease is to be obtained.

Another improvement which stamps the period under review is the introduction of indiarubber for the tyres of wheels. To produce a carriage as nearly as possible free from noise and rattle has always been the aim of high-class coachmaking. A structure composed of wood, iron, and glass, with axle-trees, doors, windows, lamps, and other parts, in use upon the road in all weathers, must from time to time require some attention with this object. To meet this difficulty, the introduction of indiarubber has been received by carriage-users as a great boon. It was about the year 1852 that Mr Reading, who at that time was known as a builder of invalid carriages, conceived the idea of encircling wheels with that material, but his method only admitted of its use on vehicles travelling slowly over good roads. This was improved upon at a later date by Mr Uriah Scott, who, taking advantage of the tempering capacity of indiarubber by the chemical action of sulphur, produced an inner rim of such density as to hold bolts, by which it could be secured through the felloe, forming a base for the outer covering of soft pliable rubber. This system was attended with satisfactory results, and was in favour for some years with persons whose health needed such provision. Another method, originated by Mr Mulliner of Liverpool in the early 'seventies, was to screw on iron flanges to the outer and inner sides of the felloes, having a kind of lip to press into the indiarubber filling the intervening space; but the cost of this—£36 per set—rendered its adoption prohibitive. Meanwhile another invention by Mr Uriah Scott, afterwards improved upon by an American patentee, came into use; this was known as the "rubber-cushioned axle," cylindrical rings being introduced between the axle-box and hub of the wheel, thus insulating the body of the carriage from the concussion of the road. This, however, necessitated the cutting away of so much of the timber of the hub as to impair its durability, and had therefore, after a few years' experience, to be abandoned in favour of an invention by a Parisian builder, who introduced indiarubber bearings between the spring and axle-tree. This was thoroughly practicable, and met with general acceptance, and it is still used in conjunction with iron and steel tyres. In 1890 the pneumatic tyre was first applied to road carriages, but not until 1893 were strenuous means taken in the hope of popularizing this invention. Its bulky appearance was a great draw-

back, contrasting strongly with the qualities which distinguish a graceful equipage; yet the practical advantages were such that, in the absence of other objections, this became a secondary consideration. The sanguine anticipations of the inventor have not, however, been realized in England, owing to fears as to the difficulty of keeping the tyres fully inflated under the weight of a carriage carrying four or more persons, and their liability to puncture and explosion. In Paris and its neighbourhood and many parts of France, pneumatic tyres are to be seen in frequent use both on public and private conveyances. In another form the indiarubber tyre has become of almost universal application.

Fig. 3.

Owing to an ingenious invention of Mr Carment, what appeared to be an insuperable difficulty in rolling a grooved tyre was overcome (Fig. 3). This so simplified the application as to bring the cost within practicable limits. The grooved tyre is now made in several sections, in some of which the inward projection for securing the rubber is dispensed with, this being kept in position by wires running through the whole length, and electrically welded at the point of contact. Whatever be the method chosen for securing the tyre, the best tyres, both for durability and ease, are those in which the rubber provided is most resilient in its nature.

In the ninth edition of this work reference is made to automatic arrangements for the lifting and lowering of the hoods of Victorias and other such carriages, and the opening and closing of Landaus. There are now many contrivances with this object, of which the most to be preferred are the simplest in their arrangements. The quarter-light or five-glass Landau is a carriage which has been greatly improved during this period. The complicated adjustments of pillars, windows, and roof have been replaced by one simple parallel movement. The first public exhibition of a finished carriage on this principle was by an English firm at the Paris Exhibition of 1876 (Fig. 4).

Fig. 4.

In the matter of style certain types of carriages have passed through marked changes during this period. Extreme lightness was at one time considered by many the one desideratum both as to appearance and actual weight, in providing which ease of movement and comfortable seating of the occupants became secondary considerations—though to these extremes builders of repute were always opposed. Still, when at the International Exhibition of Paris, 1889, it was seen that the Parisian builders had suddenly gone in the opposite direction, the world of fashion in carriages was taken by surprise. From being built upon easy, flowing, graceful lines, it was seen, with some revulsion of feeling, that these were to be displaced by the deep, full-bodied Victoria, Brougham, and Landau. Only by slow degrees did this characteristic find acceptance with English connoisseurs, and then only

in a modified form, though eventually in a greater or less degree it is now the prevailing style.

While the better types of English carriages are still pre-eminent in their constructive qualities, and represent the well-known characteristics of individual firms, some emulation may be excited by the elegant taste and careful workmanship which French builders display in points of finish, both internally and externally. Of the various types of carriages now in vogue, the Victoria, in its many varieties of form, is the most popular, accompanied, as of necessity, by the double Victoria, Sociable, Brougham, Landau, and Landau. Four-in-hand coaches for private use, as well as the "road" coaches, are built on a smaller scale than formerly; 6 feet 8 inches may now be taken as the standard height of the roof from the ground. Owing to the encouragement given by the Four-in-hand and Coaching Clubs, the ascendancy of this style of driving is still preserved to Great Britain; and in association with it the Char-à-banc, Mail Phaeton, Wagonette, and Four-wheel Dog-cart retain their popularity. Of two-wheeled vehicles the Polo-cart and Ralli-cart are most in favour, to which may be added the Governess-car, which is found convenient for many purposes not implied by its name. For a few years an effort was made, but with very indifferent success, to bring into fashion the Tandem-cart, which may again be considered almost obsolete in England, though not so in the United States, where the taste for this style of driving obtains. For street purposes the Hansom-cab, named after the inventor, an architect in Birmingham, and greatly improved by Messrs Forder and others, remains unrivalled. Since 1875 the public omnibuses of London have been much improved in comfort and ventilation, the easy staircase and convenient seats making the roof attractive to persons of both sexes.

America has long held a prominent position in connexion with the carriage industry. In all the chief cities manufactories on a colossal scale are to be found, producing thousands of vehicles annually and equipped with the most perfect labour-saving machinery; and as vehicles of any particular pattern—many of small value—are required, not singly, but in large numbers, much economy is exercised in their manufacture. It is remarkable that, as a contrast to the popular Buggy, Wagon, and Rockaway of the States, which are to be found in infinite variety, carriage establishments of the wealthy are not considered complete unless furnished with some of a European character, selected from the most eminent firms of London or Paris, in addition to others of their own manufacture. In Paris preference is given to an excess of bulk, with elaborate scroll ornamentation and diminutive windows, forming indeed, by reason of its exaggeration, a distinctive class. In respect of workmanship and finish, carriages by the best-known American builders leave nothing to be desired.

The International Exhibition of Paris, 1900, brought together examples from various Continental countries, in some of which a preference for curvilinear outline was displayed, but the best examples followed very closely the well-known English styles. In the French section it was interesting to find a revival of the once all-prevailing Chariot, Barouche, and Britzka, suspended on C and undersprings, with perch, but with ideas of lightness somewhat out of proportion to their general character.

The Sedan-chair, so fashionable a century ago (Fig. 5), was also represented by some beautifully decorated examples of that period. It is a portable chair or covered vehicle, with side-windows and entrance through hinged doorway at the front. It is borne on poles by two men. It took its name from the town of Sedan in France, where it was first used, and was introduced into England by

Sir S. Duncombe in 1634. It is still to be seen in use at the public baths at Ischl in Austria, and also in the city of Bath, England, where a revival of interest in this mode of transit in connexion with the medical baths has

Fig. 5.

taken place of late years. The Sedan can be taken into the bedroom, and the invalid is conveyed without exposure to the outer air into the mineral-water bath, and, after bathing, carried home again. The poles are so arranged that the chair may be carried up and down stairs and still preserve its horizontal position.

The Bath-chair, with a folding head, which can be used open or closed, with a glass front, mounted on three or four wheels, can be drawn or pushed by hand (Fig. 6). If required to be drawn by a donkey or small pony,

Fig. 6.

it is then mounted on four wheels, with the usual turning arrangement. James Heath, of Bath, was the inventor. He flourished rather before the middle of the 18th century, and, though he may not have foreseen it, he has contributed very greatly to the health and comfort of invalids.

(J. A. M'N.)

Carrickfergus, a maritime town and urban sanitary district, in the county of Antrim, Ireland, on Belfast Lough and the Belfast and Northern Counties railway, $9\frac{1}{2}$ miles N.E. of Belfast. It ceased to be a parliamentary borough in 1885, and in 1898 the separate county of the town of Carrickfergus was abolished. The new harbour admits vessels of 500 tons, and is connected by rail with the Northern Counties system. Population, 8923.

Carrière, Moritz (1817-1895), German philosopher and historian, was born at Griedel in the Grand Duchy of Hesse Darmstadt on 5th March 1817. After studying at the universities of Giessen, Göttingen, and Berlin, he spent a few years in Italy in the study of the fine arts, and established himself in 1842 in his old

university town of Giessen as a docent of philosophy, becoming an extraordinary professor there a few years later. In 1853 he was appointed professor at the University of Munich, lecturing mainly on æsthetics. An avowed enemy of Ultramontanism, he contributed by his writings in no small degree to make the idea of German unity more palatable to the South Germans. Carrière identified himself with the school of Fichte as one who held the theistic view of the world which aimed at reconciling the contradictions between deism and pantheism. Among his works may be mentioned: *Der Kölner Dom als freie Deutsche Kirche*, *Die philosophische Welt-Anschauung der Reformationszeit*, and *Die sittliche Weltordnung*. He died in Munich on 19th January 1895.

Carrington, Richard Christopher (1826-1875), English astronomer, son of a brewer at Brentford, was born in London on 26th May 1826. Though intended for the Church, his studies and tastes inclined him to astronomy, and with a view to gaining experience in the routine of an observatory he accepted the post of observer in the University of Durham. Finding, however, that there was little chance of obtaining instruments suitable for the work which he wished to undertake, he resigned that appointment and established an observatory of his own (1854) at Redhill. Here he devoted three years to a survey of the zone of the heavens within 9 degrees of the North Pole, the results of which are contained in his *Redhill Catalogue of 3735 Stars*. His investigation of the motion of sun-spots, in which he determined the elements of the sun's rotation, especially his important discovery of a systematic drift of the photosphere, in virtue of which the time of rotation of a spot varies according to the particular solar latitude at which it breaks out, is the work with which his name will be most closely associated. He died on 27th November 1875.

(A. A. R.*)

Carrodus, John Tiplady (1836-1895), English violinist, was born on 20th January 1836 at Keighley, in Yorkshire. He made his first appearance as a violinist in his native town at the age of nine, and had the advantage of studying with Molique at Stuttgart, where he made such progress that on his return to England in 1853 Costa got him engagements in the leading orchestras. He was a member of the Covent Garden Opera orchestra from 1855, and succeeded Sinton as leader there in 1869. He died "in harness," for his death took place at Hampstead on 13th July 1895, within a very few hours of the close of a performance. For many years he had led the Philharmonic orchestra and those of the great provincial festivals. He published several pieces for violin solo, and was a very successful teacher.

Carson, a city of Nevada, U.S.A., capital of Ormsby county, and the capital of the state, situated in $39^{\circ} 10' N.$ lat. and $119^{\circ} 46' W.$ long., in the western part of the state, at an altitude of 4720 feet, in Eagle valley, near the south base of Washoe mountains. It is on the Virginia and Truckee railway. It was founded in 1858, about the time of the discovery of the Comstock Lode, and its fortunes have been closely associated with the mines of that great ore deposit. Population (1880), 4229; (1890), 3950; (1900), 2285.

Cartagena, a seaport, dockyard, and arsenal on the Mediterranean coast of Spain, in the province of Murcia. Cartagena is one of the three great naval departments, the other two being San Fernando, near Cadiz, and Ferrol. Each department is under an admiral, whose title is captain-general in local rank. The population of Cartagena was (1887) 84,170, and (1897)

86,424. Not only have the land and coast defences been improved, but considerable sums have been expended on the port works, quays, and wharves. These changes and the completion of the through railway lines have contributed to an increase in both local commerce and population, as the latter was only 26,000 in 1870. The commercial importance of Cartagena was diminished at the beginning of 1898, when PORMAN, or Portman, a mining village about 11 miles to the eastward, situated on a well-sheltered bay, was declared by royal order an independent port. Vessels go to Porman to land coke and coal, and to load iron ore and lead. This fact explains why the number of British vessels visiting Cartagena slightly declined in 1899, the figures being 307 entered with 298,314 tons, and 310 cleared with 301,610 tons. The number of ships of other nationalities in the same year were 152 entered with 109,412 tons, and 153 cleared with 111,200 tons. The Spanish vessels trading direct over sea, cleared and entered, were 79 steamers of 100,303 tons in all, and 5 sailing vessels of 1398 tons. The export trade owes its importance chiefly to the ores from the surrounding districts. The exports of iron and manganese iron ores amounted in 1898 to 430,750 tons, those of silver lead to 56,571 tons, of soft lead to 8422 tons, and of zinc to 44,546 tons, while copper ore, copper mat, and pyrites were also exported. England imported from Cartagena in that year 8034 tons of esparto grass, while 6863 tons of fruit, cereals, barley, and oats were sent to England, France, and Belgium. The imports into Cartagena were chiefly coal, 56,516 tons from England, and coke, 18,662 tons from England, 1657 tons from Germany, and 2000 tons from North Spain. Timber came from the United States and Russia, and 1501 tons of cod-fish from Canada and Norway.

Cartagena, a port of Colombia, on the north coast of South America, capital of the department of Bolivar, situated on a low island of the Caribbean Sea, at the entrance of Cartagena Bay. In 1898 the wharf was lengthened by 120 feet, and a wharf was also made for the construction of steamboats. Cartagena is connected with the Magdalena river, both by a canal and by rail to Calamar, 60 miles distant. It retains its pre-eminence for its educational establishments. Of the churches, that of San Juan de Dios is celebrated for its altar of Italian marble. The city, which within recent years has greatly increased in prosperity, is lighted by electricity, and possesses a service of telephones and tramways. A large market—the first in the city—was erected by the municipality in 1897-98. The value of the exports now averages about £380,000 annually. During the civil war of 1885 the city underwent a siege. On the anniversary of its independence, 11th November 1897, a statue of Bolivar was unveiled, the cost being about £4000. The population is estimated at 16,000.

Cartago, a city of Costa Rica, Central America, capital of the province of the same name, situated on the railway line from Limon, about 90 miles W.S.W. of that port, and 11 miles E.S.E. of San José. Among the public buildings are a college and a hospital. At Bella Vista, a short distance from the city, are hot mineral springs, much frequented by invalids. In 1892 the population was only 3491; but the railway to Limon has already done much to revive the city's prosperity, which will be further aided by the line from San José to a proposed new port at the mouth of the Gulf of Nicoya.

Cartaxo, a town of the district of Santarem, Portugal, situated 4 miles from the right bank of the Tagus, and 7 miles S.W. from Santarem. It produces corn and good wine, and fish from the Tagus. The parish yielded

1,143,250 gallons of wine, valued at £65,350, in 1892. Population, about 7000.

Carthage, capital of Jasper county, Missouri, U.S.A., situated in 37° 11' N. lat. and 94° 18' W. long., on the south bank of Spring river, in the south-western part of the state, at an altitude of 973 feet. It is entered by two railways, the Missouri Pacific and the St Louis and San Francisco. It is in the rich lead and zinc region of south-west Missouri and south-east Kansas. Population (1890), 7981; (1900), 9416, including 273 foreign-born and 539 negroes.

Cartoon, a term now applied to the principal political drawings in the humorous or satirical papers of the day. At an earlier period satirical prints were styled "caricatures," and were issued separately; Gillray, Rowlandson, the three Cruikshanks, Heath, and others were popular favourites in this class of design. Even the insignificant little cuts by Robert Seymour in *Figaro in London*, the *diableries* in *The Fly*, and the vulgar and rancorous political skits in the flood of scurrilous little papers of the time, were dignified by the same term (see *CARICATURE*, *Ency. Brit.*, ninth ed.) The long series of *Political Sketches* by "H. B." (John Doyle) were the first examples of unexaggerated statement, and fair and decorous satire. With the advent of *Punch* and its various rivals (*The Peep-Show*, *The Great Gun*, *Diogenes*, and the like), the general tone was elevated. *Punch* at first adopted the word "pencilling" to describe the "big cut," which dealt variously with political and social topics. But when in 1843 there was held in Westminster Hall the great exhibition of cartoons from which selection was to be made of designs for the decoration in fresco of the new Houses of Parliament, *Punch* jocularly professed to range himself alongside the great artists of the day; so that the "mad designe" of the reign of Charles I. became the "cartoon" of that of Queen Victoria. John Leech's drawing in No. 105 of that journal was the first caricature to be called a cartoon: it was entitled "Substance and Shadow: the Poor ask for Bread, and the Philanthropy of the State accords—an Exhibition." Later, *Punch* dropped the word for a while, but the public took it up. Yet the *Encyclopædic Dictionary* entirely ignores the word in its application to modern satirical prints, and the monumental *Oxford Dictionary* curiously attributes the first use of it to Miss Braddon in 1863.

In England the cartoon, no longer a weapon of venomous attack, has come to be regarded as a humorous or sarcastic comment upon the weekly topic uppermost in the nation's mind, a witty or saturnine illustration of views already formed, rather than as an instrument for the manufacture of public opinion. It has almost wholly lost its rancour; it has totally lost its ferocity—the evolutionary result of peace and contentment, for satire in its more violent and more spontaneous form is but the outcome of the dissatisfaction or the rage of the multitude. The cartoon, it is agreed, must be suggestive; it must present a clear idea lucidly and, if possible, laughably worked out; and however reserved or restrained it may be, or even, when occasion demands (as in the case of Sir John Tenniel and some of his imitators), however epic in intuition, it must always figure, so to say, as a leading article transformed into a picture in the solvent, more or less mordant, of graphic fun or feeling. Matt Morgan transgressed on at least one occasion, and paid the penalty by loss of popularity. That the cartoon has greater influence for good or evil than is usually recognized has more than once been proved, and international amenities have several times been disturbed when the

satirical papers have hurt the susceptibilities of foreign nations. Among examples may be quoted the "Fashoda" cartoon in *Punch*, which caused considerable irritation in France, and the insulting drawings by Willette and Léandre in 1899-1900 in Paris, which outraged British feelings by their bad taste, indecency, and lack of chivalry.

The names of *Punch's* cartoonists, Sir John Tenniel, John Leech, Richard Doyle, Charles Keene, Linley Sambourne, among others, are household words in all English-speaking countries. Artists of ability have likewise worked in the service of *Fun*, including Paul Gray, A. B. Houghton, Matt Morgan, Fred Barnard, J. F. Sullivan, and Gordon Thomson—the last named having invented and drawn the weekly cartoon from 1870 to 1892 with only the break of a single week. Other cartoonists of the past are Watts Phillips, William M'Connell, William Brunton, and Alfred Bryan, while those of the present, besides those already mentioned, are Harry Furniss, John Proctor, William Bowcher, A. Stafford, William Parkinson, G. R. Halkett, and F. C. Gould. In France, where political passion runs high, the cartoon continues to flourish as a political engine worked with extraordinary ability and energy. The considerable number of satirical journals, supported by a population extremely alive to the ridiculous and easily moved by party feeling, gives occupation to many clever caricaturists, who employ technical methods such as lithography and colour for the reproduction of their cartoons to an extent unknown in England. Prominent among them are Caran d'Ache (E. Poiré), Pépin (E. Gillaumin), Forain, Willette, Léandre, Couturier, and Hermann-Paul. In the other countries of Europe the cartoon does not seem to be quite so popular, or to have been so vigorously exploited as in France and England, although much talent is occasionally displayed; indeed, it is not uncommon to see the picture to which, in *Punch* for example, is assigned the place of honour, relegated to a corner of the back page. In the United States many artists of striking ability have arisen, but only two names—those of Thomas Nast and J. Keppler—may be said to have gained European celebrity. (See CARICATURE AND ILLUSTRATION.)

Cary, Alice (1820-1871), and **Phœbe** (1824-1871), American poets, born near Cincinnati, Ohio, respectively on 20th April 1820, and 4th September 1824. Their education was largely self-acquired, and their work in literature was always done in unbroken companionship. In 1852 they removed to New York, and occupied a prominent position in the literary circles of that city at the time when their friend Rufus Wilmot Griswold, Poe's literary executor, was the *quasi*-dictator of American verse, and when Horace Greeley, editor of the *Tribune*, who also aided them, was making that journal the organ of the reformers in politics and the sentimentalists in letters. The prose of Alice, who was the more voluminous writer of the two, consisted of sketches and novels, now entirely forgotten; of her verse the best volume is the progressive collection of lyrics entitled *The Lover's Diary* (1867). Phœbe, whose writings were first collected in a volume entitled *Poems by Alice and Phœbe Cary* (1850), is now best known by the hymn beginning "One sweetly solemn thought." Alice died in New York, 12th February 1871,

and Phœbe in Newport, Rhode Island, 31st July of the same year.

Casablanca. See DAR EL BAIDA.

Casale Monferrato, a town and episcopal see of Piedmont, Italy, province of Alessandria, 20 miles N. by W. from Alessandria by rail, and on the river Po. In 1888 the river was spanned by a handsome iron bridge. The town possesses a school of design, carries on the raising of silk cocoons, and has clothing and cement factories, ironworks, and printing. Population, about 17,000.

Cascina, a commune of the province of Pisa, Tuscany, Italy, 8 miles E. by S. from Pisa on the railway to Florence. It is still surrounded with walls, and carries on cotton-weaving and furniture-making. Under its walls the troops of Pisa were defeated by Galeotto Malatesta and the Florentines in 1364. Population, about 24,000.

Caserta, a town and episcopal see of Campania, Italy, capital of province of Caserta, 20 miles N.N.E. from Naples by rail. It has a cathedral, a technical institute, and an agricultural school; and cotton, silk, and woollen mills, macaroni factories, and pottery works. In 1898 an ancient necropolis was discovered here. Good wine is made in the vicinity. Population of town (1881), 30,550; (1901), 32,729; of province (1881), 714,131; (1901), 783,495.

Casimir-Périer, Jean Paul Pierre (1847—), fifth President of the French Republic, was born in Paris on 8th November 1847, being the grandson of the famous Premier of Louis Philippe. He entered public life as secretary to his father, who was Minister of the Interior under the presidency of M. Thiers. He was elected to the Chamber in 1874, and distinguished himself as an active supporter of the Republic until 1883, when he resigned his seat upon the enactment of a law disqualifying the members of French royal and imperial families from employment in the public service. After this demonstration, due to his old family connexion with the House of Orleans, he re-entered the Chamber, and, continually increasing in influence and authority, was elected President of the Republic after the assassination of President Carnot in July 1894. The highest hopes were entertained of the government of one who rivalled his predecessor in integrity, and was thought to surpass him in firmness, and great was the disappointment when, after a stormy administration of six months, during which he had in some measure alienated the Moderate party without gaining the support of the more advanced Republicans, President Casimir-Périer resigned his office. The cause assigned by himself—inability to withstand the insults continually directed against him by opponents—was evidently insufficient; but it was generally believed that the real motive was impatience at finding himself a mere cipher in the hands of his ministers. Whatever the reason, the effect was to deprive France of the services of one of the foremost of her citizens, for, except for a brief appearance during the Dreyfus court-martial of 1899, which led to the circulation of many singular rumours, M. Casimir-Périer ceased to take any part in public affairs.

Caspian Sea (the ancient *Mare Caspium* or *Hyrcanium*; Russian, *Kaspiyskoye More*, formerly *Hvalynskoye More*; Persian, *Daria-i-Khyzr*, or *Gurzem*; Tatar, *Ak-Denghiz*; *Sikim*, also *Jurjan* of the old Eastern geographers), an inland sea between Europe and Asia, situated between 36° 40' to 47° 20' N. and 46° 50' to 55° 10' E. It has an area of 169,380 square miles. Its surface is 86 feet below the level of the ocean (96·7 feet,

according to the Aral-Caspian levelling).¹ Its shores mostly belong to Russia, with the exception of the southern coast, which belongs to Persia. Its general description and map were given in the ninth edition of this work.

Hydrography.—The hydrography of the Caspian was carefully investigated in 1856-72 by Captain (afterwards Vice-Admiral) Ivashintseff, and by several later expeditions directed by O. Grimm, N. Andrusoff, I. Spindler, &c., whilst the subjects of its shores, its former extension, and its geological history have been studied by Russian geologists. Its basin is naturally divided into three portions. Of these the northern, extending from west to east, and forming the great gulf Mortvi Kultuk, is the shallowest, and hardly reaches a maximum depth of 20 fathoms. It is being gradually silted up by the deposits of the Volga, the Ural, and the Terek. A depression, half of which has a depth of more than 50 fathoms, and reaches the maximum depth of 421 fathoms, occupies the middle portion of the sea. It may be considered as a continuation of the synclinal depression of the Sea of Azov and North Caucasia (Manych), and is separated from the southern and deepest portion of the Caspian by a submarine ridge, which is a continuation of the main Caucasus range, and connects it with the Kopet Dag. The depth of the Caspian over this ridge varies from 30 to 150 fathoms. Finally, the southern portion, which lies at the foot of the high Elburz border-ridge of the Persian plateau, and which may be regarded as a continuation of the Kura valley, has a depth of more than 500 fathoms in its middle (with a maximum of 516 fathoms).

Salinity.—The salinity of the Caspian is but $\frac{3}{4}$ of that of the ocean, and in the surface layers it is only 0.0075 in the northern portion and 0.015 in the middle. It is also smaller along the western coast than along the eastern, and the proportion of sulphides is greater than it is in the ocean.

Geology.—The isolation of the Caspian from the ocean must have taken place, in the opinion of Russian geologists, at a relatively recent geological period. During the early Tertiary age it belonged to the great sea which covered all South Russia, and was in open communication with the ocean. Only during the Miocene period, the so-called Sarmatian Sea of the geologists, which spread from the middle Danube through Rumania, South Russia, and along both slopes of the main Caucasus ridge to the Caspian region, began to be isolated and partially to lose its salinity. Before the beginning of the Pliocene time it was broken into three separate parts, one of which was the Aral-Caspian basin. The deposits of that period are described as the Pontic, and their fossils point to a further decrease of salinity. Towards the end of the Pliocene period, and undoubtedly so during the Post-Pliocene, the fauna of that basin took the aspect which it has now in the Caspian. Its remains, known as Aral-Caspian deposits, are widely spread round the Caspian, which then stood at a level of about 100 feet above the present, according to Sjögren, but probably even more than that. During the Ice age the Caspian covered the Steppes which now spread on its northern shore, probably joined the Black Sea (also isolated from the ocean), through the Manych depression, and sent northwards a narrow gulf, up the present Volga valley as far as the 56th degree of latitude (Aral-Caspian deposits are found on the lower Kuma). Eastwards it penetrated into the Transcasian territory, between the Great and the Little Balkhan mountains, up the Uzboi—which a few years ago was supposed to represent an old bed of the Amu-Daria, but which in reality is a dried-up strait of the Aral-Caspian basin, the bottom of which is strewn with marine Post-Pliocene deposits. Joining what is now Lake Aral, it received both the Amu and the Syr. When the great ice-cap, which covered two-thirds of European Russia, had thawed, and the subsequent general desiccation of the northern hemisphere (still continued) set in, the Caspian began to diminish, its level to go down, while its connexions, both with the Black Sea and Lake Aral, were broken.

Fauna.—The fauna of the Caspian, well studied by Eichwald, Kowalewski, Grimm, Dybowski, Kessler, and Sars, gives support to the above views. It is a mixture of fresh-water and marine forms; thus we find in it the marine herring and such fishes (*Cyprinus*, *Perca*, *Silurus*) as are, together with the fluviatile lobster, characteristic of fresh water. The Rhizopoda, *Rotalia* and *Textilaria*, one sponge (*Amorphina*), the *Amphiteis* worm, the mollusc *Cardium edule*, and various *Cardidae*, and some Amphipods (*Cumacea* and *Mysidae*), are purely marine; but they are either such forms as easily support variations in salinity, or are especially characteristic of brackish waters. Of genera which are

especially Caspian, the following are known: one sponge (*Metchnikovia*), the *Cardides* (*Adacna* and *Didacna*), three Gastropods, some Mysids, two Amphipods, and the fish *Clupeonella*, while at least four other genera belong, besides to the Caspian, only to such *limans* or creeks of the Black Sea as have lost their salinity. As to species which belong only to the Caspian fauna, we find them among the Protozoa, the Sponges (three), the Vermes (Oligochaetes, species of *Amphiteis*), the Molluscs (twenty-five species), numerous Amphipods and Mysids, the Fishes (species of *Gobius*, *Benthophilus*, *Cobitis*, &c.), and even the Mammals (*Phoca caspia*). It has been shown, moreover, that most of those specifically Caspian species have had their ancestors in the Pontic fauna, and have diverged from the ancestral type since the Caspian became isolated. The irruption of the Mediterranean Sea into the Black Sea, in consequence of the piercing of the Dardanelles, has destroyed many of the species which were retained in the Caspian, as well as in some lagoons (detached fragments) of the Black Sea. One representative of the Caspian fauna (*Glyptomotus entomon*) does not appear either in the Black Sea or the Mediterranean, but belongs to the northern seas, while several Caspian forms (*Phoca caspia*), some Mysids (*Gammarus*, *Amphiteis*, &c.) have a northern character. This led to the supposition that the Caspian stood at some recent epoch in direct communication with the Arctic Sea. However, no traces of such a connexion having as yet been discovered, the conjecture was abandoned.

Level.—The level of the Caspian is now taken at 86 feet below that of the ocean; but it has undergone several oscillations in modern times. Thus it appears from the researches of Filippoff that, during the years 1851 to 1888, it thrice stood at a maximum—in 1855, in 1868-69 (highest level), and in 1882—while the minima fell upon the years 1853 (lowest) and 1873—the total range of these oscillations being 3 feet 6½ inches. Besides these changes, there are also the seasonal ones (lowest level in January, highest in summer). The winds also show a certain periodicity, and they result in currents.

Climate.—The northern portion of the Caspian, which experiences severe frosts, and is too shallow to store in large amounts of heat in the summer, freezes for three or four months along the shores, but in the middle portion ice appears only when it is brought by northern winds.

Fisheries.—There is no other inland sea in the world so rich in fish as the Caspian is at the mouths of its great rivers, the Volga, the Ural, the Terek, and the Kura. It was estimated, in 1882 and 1892, that every year no less than from 264,000 to 297,000 tons of various fish are caught in the North Caspian and the lower Volga, while Dr O. Grimm's more correct estimate for 1896 gives 393,000 tons. Seal-hunting is also an important item.

Navigation.—Navigation on the Caspian is maintained by 213 steamers and 540 sailing vessels, representing an aggregate of nearly 220,000 tons (39 per cent. of the whole Russian commercial fleet), which transport every year about 200,000 passengers and about 3,200,000 tons of goods. The trade is partly with Persia and partly coasting, immense quantities of naphtha and other produce being exported from Caspian ports to Russia, while Russian goods are imported to Caucasia and the Transcasian territory for Turkestan and Bokhara. A considerable amount of goods, chiefly raw cotton, has been added to the traffic since the completion of the Transcasian railway. The Caspian ports are entered every year by an average of 20,000 vessels (6000 at Astrakhan), mainly engaged in coasting trade. The chief Russian ports are: Astrakhan, Petrovsk, Derbent (recently improved), Baku, and Lenkoran on the west coast; Krasnovodsk (head of Transcasian railway) and Mikhailovsk on the east coast; and Resht on Persian territory.

A detachment of the Russian navy, consisting of seven gunboats, known as the "Caspian flotilla," is kept on this sea. Its naval station is at Ashur-ada, on an island close to the Persian coast.

The Gulf of KARA-BOGAZ, or KARA-BUGAZ (also *Aji-daria* or *Kuli-daria*), on the east coast of the Caspian Sea, is a vast expanse of water which is separated from the Caspian by a narrow sand-bar pierced only by a narrow strait, about 1½ miles long and from 115 to 170 yards wide—the Kara-bugaz strait. A current flows through it into the gulf at a rate of 1½ to 3½ miles per hour.

The area of this gulf being about 7500 square marine miles (100 English miles from W. to E. and 87 English miles from N. to S.), its evaporation is very great. It has been proposed to dam the strait in order to raise the level of the Caspian and to increase its salinity. The suggestion has also been made that a wire net stretched across the strait would prevent fishes from entering the gulf, where they get lost. Expeditions sent in 1895 and 1896 to study these questions discovered that the

¹ By the triangulation of 1840 its level was found to be 84 feet below the level of the Black Sea. The Caucasus triangulation of 1860-70 gave 89 feet. It remains an open question whether such a considerable difference can be explained by mere errors. But a longer series of observations of the changes of level due to accidental causes (winds, rains) is required before any positive conclusions may be made.

bottom of the gulf is covered for an area of about 1300 square miles with a layer of Epsom salt, which represents a quite unique formation in nature of a stock of about 1,000,000,000 tons of that salt. Owing to the slight depth of the gulf, this could be easily extracted.

PUSCHKIN, *Caspian Sea*, 1877; FILIPPOFF, *Marine Geography of the Caspian Basin*, 1877; *Memoirs (Trudy) of the Aral-Caspian Expedition of 1876-77*, 2 vols., edited by the St Petersburg Society of Naturalists; N. ANDRUSOV, "A Sketch of the Development of the Caspian Sea and its Inhabitants" (*Zapiski of the Russ. Geogr. Soc.; General Geogr.*, vol. xxiv.); (all Russian); EICHWALD, *Fauna Caspio-caucasica*. (P. A. K.)

Cassano, a town of the province of Milan, Lombardy, Italy, 16 miles E. by N. from Milan by rail to Brescia, and on the river Adda, here crossed by a long stone bridge. It is famous for the defeat of Prince Eugene, commanding the Austrians, by the French under Vendôme in 1705, and for the defeat of Moreau by the Austro-Russian army under Suvoroff in 1799. Its manufactures include linen, silk, pottery, and ropes. Population, about 5250.

Cassel, a town of Prussia, capital of the province of Hesse-Nassau, 124 miles by rail N.N.E. from Frankfurt-on-Main, on the river Fulda. A building was erected in 1871-77 to accommodate the picture gallery as well as collections of porcelain and pottery and industrial art. There are also the Bose Museum, the museums of natural history and ethnography, an industrial exhibition hall, and an industrial art school. A Lutheran church (Gothic) was erected in 1892-97, a post office (Renaissance) in 1881, and new administrative offices and law courts in 1876-80. The public library contains considerably over 150,000 volumes. The most noticeable of the public monuments recently set up are those to the Emperor William I. (1898), to the musician Spohr (1883), and the lion fountain (1881). The towers of St Martin's church were rebuilt in 1889-92. Cassel is the headquarters of the 11th German army corps. There are here a military school, a medical college, an academy of the plastic arts, and a trades school. The industries embrace the making of railway carriages, machinery, scientific instruments, porcelain, tobacco and cigars, lithography, jute-spinning, iron-founding, brewing, and gardening. Population (1885), 64,083; (1900), 106,001.

Cassino, a town of Campania, Italy, in the province of Caserta, 42 miles N.W. from Capua by railway. It took the place of the ancient *Casinum*; but all through the Middle Ages, and later, it was known as San Germano, but in 1871 returned to its original name of Cassino. The place possesses some remains of antiquity, as an amphitheatre and an antique funeral monument, now converted into the Church of the Crucifixion. At *Casinum* was the villa of M. Terentius Varro, made notorious by the orgies of Mark Antony (*Cic. Phil.* ii. 40). Population, about 13,500.

Castelar y Ripoll, Emilio (1832-1899), Spanish statesman, was born at Cadiz on 8th September 1832. At the age of seven he lost his father, who had taken an active part in the progressist agitations during the reign of Ferdinand VII., and had passed several years as an exile in England. He attended a grammar-school at Sax. In 1848 he began to study law in Madrid, but soon elected to compete for admittance at the school of philosophy and letters, where he took the degree of doctor in 1853. He was an obscure republican student when the Spanish revolutionary move-

ment of 1854 took place and the young liberals and democrats of that epoch decided to hold a meeting in the largest theatre of the capital. On that occasion Castelar delivered his maiden speech, which at once placed him in the van of the advanced politicians of the reign of Queen Isabella. From that moment he took an active part in politics, radical journalism, literary and historical pursuits. Castelar was compromised in the first rising of June 1866, which was concerted by Marshal Prim, and crushed, after much bloodshed, in the streets by Marshals O'Donnell and Serrano. A court-martial condemned him *in contumaciam* to death by "garote vil," and he had to hide in the house of a friend until he escaped to France. There he lived two years until the successful revolution of 1868 allowed him to return and enter the Cortes for the first time—as deputy for Zaragossa. At the same time he resumed the professorship of history at the Madrid university. Castelar soon became famous by his rhetorical speeches in the Constituent Cortes of 1869, where he led the republican minority in advocating a federal republic as the logical outcome of the recent revolution. He thus gave much trouble to men like Serrano, Topete, and Prim, who had never harboured the idea of drifting into advanced democracy, and who had each his own scheme for re-establishing the monarchy with certain constitutional restrictions. Hence arose Castelar's constant and vigorous criticisms of the successive plans mooted to place a Hohenzollern, a Portuguese, the duke of Montpensier, Espartero, and finally Amadeus of Savoy on the throne. He attacked with relentless vigour the shortlived monarchy of Amadeus, and contributed to its downfall.

The abdication of Amadeus led to the proclamation of the federal republic. The senate and congress, very largely composed of monarchists, permitted themselves to be dragged along into democracy by the republican minority headed by Salmeron, Figueras, Pi y Margall, and Castelar. The shortlived federal republic from 11th February 1873 to 3rd January 1874 was the culminating point of the career of Castelar, and his conduct during those eleven months has been much praised by the wiser portion of his fellow-countrymen, though it alienated from him the sympathies of the majority of his quondam friends in the republican ranks.

Before the revolution of 1868, Castelar had begun to dissent from the doctrines of the more advanced republicans, and particularly as to the means to be employed for their success. He abhorred bloodshed, he disliked mob rule, he did not approve of military *pronunciamientos*. His ideal would have been a parliamentary republic on the American lines, with some traits of the Swiss constitution to keep in touch with the regionalist and provincialist inclinations of many parts of the peninsula. He would have placed at the head of his commonwealth a president and Cortes freely elected by the people, ruling the country in a liberal spirit and with due respect for conservative principles, religious traditions, and national unity. Such a statesman was sure to clash with the doctrinaires, like Salmeron, who wanted to imitate French methods; with Pi y Margall, who wanted a federal republic after purely Spanish ideas of decentralization; and above all with the intransigent and gloomy fanatics who became the leaders of the cantonal insurrections at Cadiz, Seville, Valencia, Malaga, and Cartagena in 1873.

At first Castelar did his best to work with the other republican members of the first government of the federal republic. He accepted the post of minister for foreign affairs. He even went so far as to side with his colleagues, when serious difficulties arose between the new government and the president of the Cortes, Señor Martos, who was backed by a very imposing commission composed of the most

influential conservative members of the last parliament of the Savoyard king, which had suspended its sittings shortly after proclaiming the federal republic. A sharp struggle was carried on for weeks between the executive and this commission, at first presided over by Martos, and, when he resigned, by Salmeron. In the background Marshal Serrano and many politicians and military men steadily advocated a *coup d'état* in order to avert the triumph of the republicans. The adversaries of the executive were prompted by the captain-general of Madrid, Pavia, who promised the co-operation of the garrison of the capital. The president, Salmeron, and Marshal Serrano himself lacked decision at the last moment, and lost time and many opportunities by which the republican ministers profited. The federal republicans became masters of the situation in the last fortnight of April 1873, and turned the tables on their adversaries by making a pacific bloodless *pronunciamiento*.

The battalions of the militia that had assembled in the bull-ring near Marshal Serrano's house to assist the anti-democratic movement were disarmed, and their leaders, the politicians and generals, were allowed to escape to France or Portugal. The Cortes were dissolved, and the federal and constituent Cortes of the republic convened, but they only sat during the summer of 1873, long enough to show their absolute incapacity, and to convince the executive that the safest policy was to suspend the session for several months.

This was the darkest period of the annals of the Spanish revolution of 1873-74. Matters got to such a climax of disorder, disturbance, and confusion, from the highest to the lowest strata of Spanish society, that the president of the executive, Figueras, deserted his post and fled the country. Pi y Margall and Salmeron, in successive attempts to govern, found no support in the really important and influential elements of Spanish society. Salmeron had even to appeal to such well-known reactionary generals as Pavia, Sanchez Bregna, and Moriones, to assume the command of the armies in the south and in the north of Spain. Fortunately these officers responded to the call of the executive. In less than five weeks a few thousand men properly handled sufficed to quell the cantonal risings in Cordoba, Sevilla, Cadiz, and Malaga, and the whole of the south might have been soon pacified, if the federal republican ministers had not once more given way to the pressure of the majority of the Cortes, composed of "Intransigentes" and radical republicans. The president Salmeron, after showing much indecision, resigned, but not until he had recalled the general in command in Andalusia, Pavia. This resignation was not an unfortunate event for the country, as the federal Cortes not only made Castelar chief of the executive, though his partisans were in a minority in the Parliament, but they gave him much liberty to act, as they decided to suspend the sittings of the house until 2nd January 1874. This was the turning-point of the Spanish revolution, as from that day the tide set in towards the successive developments that led to the restoration of the Bourbons.

On becoming the ruler of Spain at the beginning of September 1873, Castelar, at once devoted his attention to the reorganization of the army, whose numbers had dwindled down to about 70,000 men. This force, though aided by considerable bodies of local militia and volunteers in the northern and western provinces, was insufficient to cope with the 60,000 Carlists in arms, and with the still formidable nucleus of cantonalists around Alcoy and Cartagena. To supply the deficiencies Castelar called out more than 100,000 conscripts, who joined the colours in less than six weeks. He selected his generals without respect of politics, sending Moriones to the Basque

provinces and Navarre at the head of 20,000 men, Martinez Campos to Catalonia with several thousand, and Lopez Dominguez, the nephew of Marshal Serrano, to begin the land blockade of the last stronghold of the cantonal insurgents, Cartagena, where the crews of Spain's only fleet had joined the revolt.

Castelar next turned his attention to the Church. He renewed direct relations with the Vatican, and at last induced Pope Pius IX. to approve his selection of two dignitaries to occupy vacant sees as well as his nominee for the vacant archbishopric of Valencia, a prelate who afterwards became archbishop of Toledo, and remained to the end a close friend of Castelar. He put a stop to all persecutions of the Church and religious orders, and enforced respect of Church property. He attempted to restore some order in the treasury and administration of finance, with a view to obtain ways and means to cover the expense of the three civil wars, Carlist, cantonal, and Cuban. The Cuban insurgents gave him much trouble and anxiety, the famous *Virginus* incident nearly leading to a rupture between Spain and the United States. Castelar sent out to Cuba all the reinforcements he could spare, and a new governor-general, Jovellar, whom he peremptorily instructed to crush the mutinous spirit of the Cuban militia, and not allow them to drag Spain into a conflict with the United States. Acting upon the instructions of Castelar, Jovellar gave up the filibuster vessels, and those of the crew and passengers who had not been summarily shot by General Burriel. Castelar always prided himself on having terminated this incident without too much damage to the prestige of Spain.

At the end of 1873 Castelar had reason to be satisfied with the results of his efforts, with the military operations in the peninsula, with the assistance he was getting from the middle classes and even from many of the political elements of the Spanish revolution that were not republican. On the other hand, on the eve of the meeting of the federal Cortes, he could indulge in no illusions as to what he had to expect from the bulk of the republicans, who openly dissented from his conservative and conciliatory policy, and announced that they would reverse it on the very day the Cortes met. Warnings came in plenty, and no less a personage than the man he had made captain-general of Madrid, General Pavia, suggested that, if a conflict arose between Castelar and the majority of the Cortes, not only the garrison of Madrid and its chief, but all the armies in the field and their generals, were disposed to stand by the president. Castelar knew too well what such offers meant in the classic land of *pronunciamientos*, and he refused so flatly that Pavia did not renew his advice. The sequel is soon told. The Cortes met on 2nd January 1874. The intransigent majority refused to listen to a last eloquent appeal that Castelar made to their patriotism and common sense, and they passed a vote of censure. Castelar resigned. The Cortes went on wrangling for a day and night until, at daybreak on 3rd January 1874, General Pavia forcibly ejected the deputies, closed and dissolved the Cortes, and called up Marshal Serrano to form a provisional government.

Castelar kept apart from active politics during the twelve months that Serrano acted as president of the republic. Another *pronunciamiento* finally put an end to it in the last week of December 1874, when Generals Campos at Sagunto, Jovellar at Valencia, Primo de Rivera at Madrid, and Laserna at Logroño, proclaimed Alphonso XII. king of Spain. Castelar then went into voluntary exile for fifteen months, at the end of which he was elected deputy for Barcelona. He sat in all subsequent parliaments, and just a month before his death he was elected as representative of Murcia. During that period

he became even more estranged from the majority of the republicans. Bitter experience had shown him that their federal doctrines and revolutionary methods could lead to nothing in harmony with the aspirations of the majority of Spaniards. He elected, to use his own words, to defend and to seek the realization of the substance of the programme of the Spanish revolution of 1868 by evolution, and legal, pacific means. Hence the contrast between his attitude from 1876 to 1886, during the reign of Alphonso XII., when he stood in the front rank of the Opposition to defend the reforms of that revolution against Señor Canovas, and his attitude from 1886 to 1891. In this latter period Castelar acted as a sort of independent auxiliary of Sagasta and of the Liberal party. As soon as Castelar saw universal suffrage re-established he solemnly declared in the Cortes that his task was accomplished, his political mission at an end, and that he proposed to devote the remainder of his life to those literary, historical, philosophical, and economic studies which he had never neglected even in the busiest days of his political career. Indeed, it was his extraordinary activity and power of assimilation in such directions that allowed him to keep his fellow-countrymen so well informed of what was going on in the outer world. His literary and journalistic labours occupied much of his time, and were his chief means of subsistence. He left unfinished a history of Europe in the 19th century. The most conspicuous of his earlier works were:—*A History of Civilization in the First Five Centuries of Christianity, Recollections of Italy, Life of Lord Byron, The History of the Republican Movement in Europe, The Redemption of Slaves, The Religious Revolution, Historical Essays on the Middle Ages, The Eastern Question, Fra Filippo Lippi, History of the Discovery of America*, and some historical novels. Castelar died near Murcia on 25th May 1899, at the age of 66. His funeral at Madrid was an imposing demonstration of the sympathy and respect of all classes and parties. (A. E. H.)

Castelfranco, a town of the province of Bologna, Emilia, Italy, 16 miles N.W. from Bologna on the railway to Modena. It has several churches with pictures by artists of the Bolognese school, and carries on spinning of textiles and match-making. It is identified with the ancient *Forum Gallorum*, where Hirtius defeated Antonius in 43 B.C. Population, about 12,500.

Castelfranco Veneto, a town of the province of Treviso, Venetia, Italy, 16 miles W. from Treviso on the railway to Verona. It is famous as the birthplace of the painter Giorgione, i.e., Barbarelli (1476-1511), and for the altar-piece by him in the principal church. The people are engaged in the silk industries. Here the French defeated the Austrians under Prince Rohan in 1805. Population, about 7500.

Castellammare, a town of Campania, Italy, in the province of Naples, on the E. shore of the Gulf of Naples, 18 miles by rail S.E. from Naples. The royal arsenals and a royal dockyard are the principal industrial works; but there are also ironworks, cotton-mills, and a small-arms factory. The royal palace has been converted into a hotel. The imports varied between £271,000 and £1,100,000 in the eleven years ending 1899, and the exports (65 per cent. macaroni) increased from £82,400 in 1888 to £335,900 in 1899. The port is cleared by about 280 vessels of 250,000 tons annually. In 1899 the Italian Government voted £56,000 for the extension of the pier and the improvement of the harbour. Population, about 34,500.

Castello Branco, a city and episcopal see of Portugal, capital and district of same name, 120 miles

N.E. from Lisbon. In the upper town there is an ancient castle, now used as a lyceum. Population, 6728. The district of CASTELLO BRANCO consists chiefly of the valleys of the Ponsul, Ocreza, and Aravil (right-hand affluents of the Tagus), although about 50 per cent. of the surface is uncultivated. Area, 2556 square miles. Population, 205,211, giving 80 inhabitants to the square mile.

Castellon de la Plana, a maritime province in the E. of Spain, with an area of 2446 square miles, divided into 9 administrative districts and 140 parishes; population (1887), 292,437; (1897), 304,477. The surface is mostly mountainous, and flat only near the coast. The principal rivers are the Mijares, Palencia, Bergantes, and Cenia. The climate is cold and variable in the hilly districts, temperate in winter, and very warm in summer in the lowlands. Eighty miles of railways are already worked, and new lines are being constructed. The local industries are increasing, and are mainly connected with iron and copper works, salt-fish factories, paper, porcelain, woollen, cotton, silk, esparto, brandy, and oils. Wine, oranges, and oil are exported to foreign countries and other parts of Spain. About 100 vessels annually enter the ports of the province for foreign trade, and 1800 coasting vessels. The fishing fleet is composed of 300 boats. Only 3 mines—1 zinc, 1 iron, 1 lead—are worked. The live stock includes 3803 horses, 18,572 mules, 8221 asses, 1515 cattle, 164,273 sheep, 53,373 goats, 20,473 pigs. 115,800 acres are devoted to the culture of wheat, 2066 to that of oats, 15,600 to barley, 15,042 to rye, 4707 to maize, 15,660 to chick-peas, 128,405 to vines, 72,335 to olive groves.

Castellon de la Plana, the capital of the above province, situated 4 miles from the sea and 40 N.N.E. of Valencia. Its population was 25,195 in 1887, and 30,584 in 1897. Its port, called El Grao, is on the coast some miles from the town, and is entered by about 200 vessels every year. It is a comparatively modern town, of which the industries—manufactures of leather, porcelain, silk, brandy, cork, and linen—are developing. The environs are fertile and well irrigated by water drawn from the river Mijares.

Castel San Pietro, a town of the province of Bologna, Emilia, Italy, 7 miles S.E. from Bologna. It has saline and ferruginous mineral springs (64°4'-73°4' Fahr.) and baths. Population, about 12,500.

Castelvetro, a town of the province of Trapani, Sicily, Italy, 46 miles S.E. from Trapani by rail. There is a small museum containing relics from Selinus, including terra-cottas and a bronze statuette of Apollo. The town has brickworks, olive-oil presses, and macaroni factories. Population, about 20,500. Seven miles to the south-west at Campobello are the quarries whence the ancients extracted the stone for the temples, &c., of Selinus.

Castle Douglas, a burgh of barony, police burgh, and railway junction of Kirkcudbrightshire, Scotland, on Carlingwark Loch, 19½ miles S.W. of Dumfries. Its auction marts for sheep and cattle sales are now the largest in the south-east of Scotland; at an autumn sale as many as 15,000 sheep and 1400 cattle are disposed of in one day. It has a foundry, an agricultural implement work, and a tannery; a town hall with reading-room and library, and a Diamond Jubilee cottage hospital. Water and drainage schemes have been carried out. There are five branch banks. The churches are Established, three United Free, Episcopal and Roman Catholic. The public school had an average attendance of 487 in 1898-99; and a Roman Catholic school of 49. Population (1881), 2565; (1891), 2851; (1901), 3018.

Castleford, a township in the Osgoldcross parliamentary division of Yorkshire, England, on the Aire, 10 miles S.E. of Leeds by rail. Old Watling Street ran through the parish, and Roman remains have been found in the neighbourhood. There are Established, Roman Catholic, and numerous Nonconformist churches; also a market-hall. Large glass-bottle and earthenware-jar works, chemical works, and neighbouring collieries employ the inhabitants. Area of township (an urban district), 564 acres; population (1881), 10,530; (1901), 17,380.

Castlemaine, a town of Victoria, Australia, in the county of Talbot, 78 miles by rail N.N.W. from Melbourne. There are important gold-mines in the district, which is also a fine agricultural one. Slate and flagstone are quarried. The gold-diggings were amongst the first discovered in the colony. Population (1881), 5787; (1901), 5704.

Gastrogiovanni, a fortified town of Sicily, Italy, province of Caltanissetta, from which it is 8 miles distant by rail. It has a public library, with fine incunabula, a museum, and sulphur mines, mineral springs, olive-oil mills, and macaroni factories. Population, about 22,700.

Castro Urdiales, a seaport of Spain, in the province of Santander. This town has increased in size, population, and importance very rapidly since 1879, owing to the development of mining interests in its environs. The total amount of iron ore shipped rose from 277,200 tons in 1894 to 413,369 in 1898. The total exports of tinned sardines in 1898 were valued at £21,300, all prepared in the town. Castro is now connected with Bilbao by the coast line between the capital of Biscay and Santander. The movement of British shipping at the port in 1898 was as follows: 102 vessels in ballast with a tonnage of 133,105 entered, and 60 vessels with 101,587 tons of cargoes, valued at £40,634, cleared for Great Britain. Population (1897), 12,268.

Castrovillari, a fortified town of the province of Cosenza, Calabria, Italy, 44 miles N. from Cosenza. It is situated in a wide fertile valley around the foot of an old Norman castle. The people press out olive oil and make casks. Population, about 11,500.

Catacombs of Rome—*Discoveries since 1870.* In 1873 was discovered, near the cemetery of St Domitilla, the semi-subterranean basilica of SS. Nereus and Achilleus, 100 feet by 60 feet. This is now covered with a roof, and the fallen columns have been raised up. The lower part of a pillar, which once supported a baldachino over the altar, still preserves the name ACILLEUS, and beneath it a bas-relief of the martyr, with his hands bound, receiving his death-blow from the executioner. The base of a similar column has only feet in the same attitude, and probably bore the name NEREUS. In a grave in the apse was found a large fragment of an inscription, composed by Pope Damasus, but set up by his successor Siricius, which, from the note-book of a Salzburg pilgrim of the 8th century, can be completed thus:—

Militiæ nomen dederant sævum
Officium pariter spectantes juss
Præceptis pulsante metu servi
Mira fides rerum subito posue
Conversi fugiunt ducis impia castr
Projiciunt clypeos faleras tel
Confessi gaudent Christi portar

GLORIA CHRISTI

Nereus (see Rom. xvi. 15) and Achilleus, said to have been baptized by St Peter, refused to do the bidding of Domitian as prætorians, and entering the service of

Flavia Domitilla, suffered martyrdom with their mistress, Petronilla, of the Aurelian family closely connected with the Flavii, and the spiritual daughter of St Peter, was buried in a sarcophagus, with the inscription:—

AVRELIAE·PETRONILLAE·FIL·DVLCISSIMAE

This is now in St Peter's, but was probably originally behind the apse of this basilica, for there is a fresco of her in an arcosolium, with a matron named Veneranda. The original entrance to the cemetery leads directly into a spacious corridor with no *loculi*, but recesses for sarcophagi, and decorations of the classical style of the 2nd century. From this a wide staircase leads directly down to a chamber, discovered in March 1881, of a very early date. Within an arcosolium is a tablet set up by "Aurelius Ampliatus and his son Gordian, to Aurelia Bonifatia, his incomparable wife, a woman of true chastity, who lived 25 years, 2 months, 4 days, and 2 hours." The letters are of the 2nd century; but above the arcosolium was found a stone with great letters, 5 or 6 inches high: "AMPLIATI, the tomb of Ampliatus." Now Ampliatus is a servile name: how comes it to be set up with such distinction in the sepulchre of the Flavii? Romans xvi. 8 supplies the answer: "Salute Ampliatus, most beloved to me in the Lord." De Rossi thinks the identification well grounded (*Bullettino*, 1881, p. 74). Epitaphs of members of the Flavian family have been found here, and others stating that they are put up "EX INDULGENTIA FLAVIAE DOMITILLAE VESPASIANI NEPTIS." So that De Rossi did not hesitate to complete an inscription on a broken stone thus:—

Sepulc
Flavi
RVVM
ORVM

De Rossi began his excavations in the cemetery of St Prisalla in 1851, but for thirty years nothing but what had been described by Bosio came to light. In 1880 he unearthed a portion near the *Capella Greca*, and found galleries that had not been touched since they were filled in during the Diocletian persecution. The *loculi* were intact and the epitaphs still in their places, so that "they form a kind of museum, in which the development, the *formulae*, and the symbolic figures of Christian epigraphy, from its origin to the end of the 3rd or 4th century, can be notified, and contemplated, not in artificial specimens as in the Lateran, but in the genuine and living reality of their original condition" (*Bullett.*, 1884, p. 68). Many of the names mentioned in St Paul's Epistles are found here: Phœbe, Prisca, Aquilius, Felix Ampliatus, Epenetus, Olympias, Onesimus, Philemon, Asyncritus, Lucius, Julia, Caius, Timotheus, Tychicus, Crescens, Urbanus, Hermogenes, Tryphæna and Trypho(sa) on the same stone. Petrus, a very rare name in the Catacombs, is found here several times, both in Greek and Latin. The neighbouring *Cœmeterium Ostriarium* was anciently known as "*Fons S. Petri*," "*ubi Petrus baptizavit*," "*ubi Petrus prius sedet*." This cemetery derives its name from Priscilla, mother of Pudens, who is said to have given hospitality to St Peter the Apostle. We are reminded of St Paul, and of his friends Aquila and Prisca, by a monument erected by a freedman of an emperor, both of whose names have perished, but the freedman was PRÆPOSITVS TABERNACVLORVM—chief tentmaker. In 1888 a corridor was discovered which had at one time been isolated from the rest of the cemetery. It had no *loculi*, but recesses in the wall to receive sarcophagi. At the end of the corridor there was a large chamber, 23 feet by 13 feet, once lined with marble and the ceiling covered with mosaic, a few fragments of which

still remain. The only tomb here was a sarcophagus, of which the broken front bears the letters which show it to have been the epitaph of one of the Acilian family:—

ACILIO GLABRIONI FILIO

In the vicinity are fragments of the epitaphs of Manius Acilius and Priscilla, of Quintus Acilius and Caia Acilia in Greek, another Greek inscription "Acilius Rufinus mayest thou live in God." After careful examination of the nine Acilii, who were consuls, De Rossi concludes that this was the resting-place of that Acilius Glabrio, consul with Trajan, A.D. 91, who in the year of his consulate was compelled by Domitian to fight with beasts in the arena, and then banished, and put to death in 95. The question of his Christianity seems settled by the discovery of the sepulchre of these Christian Acilii. From this crypt a staircase led up to the basilica in which Pope Sylvester was buried, and the whole plan of which was laid bare by De Rossi. The tomb of St Sylvester could be identified, and that of Pope Siricius "at his feet," as the pilgrim noted (*Bullett.*, 1890, pp. 106-119).

Just before De Rossi's death, Mgr. Wilpert discovered in the *Capella Greca* a painting of the "*Fractio Panis*" or Eucharistic Feast, which he cleansed from the dust with which it had been covered. The picture of the Blessed Virgin and Child, which De Rossi ascribed to the 2nd, if not to the 1st century, has received an unexpected proof of its antiquity. In 1890 the floor of the gallery in which it stands was excavated, and another floor was found to be 6 feet below its supposed level. The *loculi* in this lower portion were intact, with inscriptions of the 2nd century still in their places, proving that the niche in which that picture was painted must have been considerably older than the lowering of the floor. A flight of iron steps enables the visitor now to examine this venerable specimen of early Christian art.

Since the death of De Rossi, one of his pupils, M. Stevenson, since dead, discovered in 1896 a small subterranean basilica in the Catacomb of St Peter and Marcellinus on the Via Labicana, with pious acclamations on the plaster similar to those in the Papal crypt in St Callixtus. Near the well-known subterranean chapel in the *Cemeterium Ostrianum* was discovered by Mgr. Crostera, in 1877, another chapel, in which Signor Armellini found traces of St Emerentiana, foster-sister of St Agnes. Near this a whole region of galleries has been brought to light, with *loculi* intact. Glass has been placed before them, so that their contents can be examined on the spot.

Rome.—De Rossi's fourth volume contains a full account of the Cemetery of St Domitilla. The works of Lanciani and Marucchi should be studied by those unable to consult De Rossi's great work. († W. R. B.)

Catamarca, a province in the west of the Argentine Republic. It is bounded on the N. by Salta and Tucuman, on the W. by Chile, on the E. by Santiago del Estero and Cordoba, on the S. by La Rioja. The official area at the census of 1895 was 47,531 square miles. The population in 1869 was 79,962; in 1895 it was 90,161. The province is divided into fifteen departments. In 1895 there were 6834 farms, and 39,051 acres planted in cereals. The capital, CATAMARCA, had a population in 1895 of 7397.

Catania, a city of Italy, in the province of Catania, on the eastern coast of Sicily, near the foot of Mount Etna. Both population and trade underwent a remarkable increase between 1865 and 1880, during which period Catania was the only large Sicilian city with a

harbour directly connected by railway with the centres of sulphur production. Architecturally it is the most modern and regularly built Sicilian town, since it has several times been rebuilt in consequence of earthquakes. In 1885 the university was raised from second to first-class status, and faculties of philosophy and letters, and natural science and mathematics were added to those of jurisprudence and medicine and surgery, which it already possessed. The *Consorzio Universitario*, founded by the local and provincial authorities for the improvement of the university, established, with the aid of private munificence, a geographical museum, and has obtained for the university the so-called "Rocks of the Cyclops" for geological studies, and has also begun an archaeological museum. These efforts have been so successful that in 1899 the university counted 42 official and 40 free professors (*liberi docenti*), while there were 968 students, as compared with 535 in 1890. In 1898, 6406 vessels of 2,466,787 tons entered and cleared, loading and unloading 433,150 tons of goods. Little change in the volume of the trade has taken place of recent years. The vicinity of Etna, and the beauty of the city and its surroundings, attract large numbers of foreign visitors every year. Catania is also within easy reach of Syracuse and its Greek remains, and also of the extremely interesting archaeological site of Taormina. Population, of town (1881) 100,417, (1901) 149,694; of province (1881) 563,457, (1901) 711,923. (G. Mo.)

Catanzaro, a town and episcopal see of Calabria, Italy, capital of the province of Catanzaro, 5 miles from the Ionian Sea, and 110 miles by rail N.E. from Reggio. University classes are held in law, medicine, and pharmacy. There is a coasting trade in wine, olive oil, and cereals, the port being cleared by 105 vessels of 58,530 tons in 1897. Population (1881), 24,094; (1901), 31,887.

Catholic Apostolic Church, The.—This community (the title "Irvingites" is repudiated) has not changed recently in general constitution or doctrine. The community does not publish statistics. Its growth during late years is said to have been more marked in Germany and elsewhere than in Great Britain. The sketch of the constitution given in the ninth edition of the *Encyclopædia Britannica*, prescribing the 12 "prophets," 12 "evangelists," 12 "pastors," and the 24 priests for each church, is an ideal outline which has never been fulfilled. There has never been a "central episcopacy" of 48. The "Apostles" alone have always held the supreme authority, though for some years there have been "coadjutors" appointed to assist the one surviving "Apostle," and to exercise the functions of the "Apostolate." The last "Apostle" died on 3rd February 1901. No readjustment of the constitution had been made up to the autumn of that year.

Catskill, a village of New York, U.S.A., capital of Greene county, situated in 42° 13' N. lat. and 73° 52' W. long., on the western bank of Hudson river, in the eastern part of the state. It is entered by the West Shore railway. The site is hilly and the street plan irregular. Several steamboat lines connect Catskill with New York, Albany, and other river points. Population (1880), 4320; (1890), 4920; (1900), 5484 (657 foreign-born, and 304 negroes).

Cattaro, the chief town of the government district of the same name in Dalmatia, Austria. In 1890 the population of the town was 3329, and of the commune 5435, mainly Slav, with a considerable German minority. It has a garrison of 1035 men. There is a steamboat service to Trieste, and a road to Cettigne. Cattaro was the

principal Austrian *point d'appui* in the insurrections which broke out in 1869 and 1881-82, in the barren mountainous district of the Krivoscie, which lies between the Bocche di Cattaro, Herzegovina, and Montenegro. The system of fortifications comprising Cattaro and the small town of Castelnuova at the mouth of the gulf, now extends to the heights of the Krivoscie, which are crowned with small forts.

Cattegat. See NORTH SEA and BALTIC SEA.

Cattle. See AGRICULTURE.

Cauca, a department of the republic of Colombia, bounded on the N.W. by Panama, on the N. by the Caribbean Sea, on the E. by the departments of Bolivar, Antioquia, Tolima, and Cundinamarca, Venezuela, and Brazil; on the S. by Brazil and Ecuador; and on the W. by the Pacific Ocean. Area, 257,463 square miles, including a number of islands along the Pacific and Atlantic coasts, covering an area of some 77 square miles. The capital, Popayán, has 10,000 inhabitants. Other principal towns are Cali (16,000), Buenaventura, Pasto, Cartago, Buga, Barbacoas.

Caucasus, a name indiscriminately applied to (a) the great chain of mountains which runs N.W. to S.E. from the Black Sea to the Caspian, and which ought alone to retain this name (Caucasus, Caucasus Range, Great Caucasus); (b) the whole series of mountains, highlands, and plateaux which is found in the Ponto-Caspian isthmus—the name of *Little Caucasus*, or *Anti-Caucasus*, being loosely applied to both the escarpment of Transcaucasia which faces the Caucasus Range and to the highlands of Transcaucasia altogether; and (c) the subdivision of the Russian Empire known as *Kavkazskiy Krai* (Caucasus Region), or *Caucasia*, or *General-Governorship*, and formerly *Lieutenancy*, of the *Caucasus*. In the last-named application it is that section of the Russian dominions in Asia which occupies the isthmus between the Black Sea and the Caspian, as well as portions of the plateaux of Asia Minor and Armenia. Its northern boundary is the Kuma-Manych depression, which is a succession of narrow, half-desiccated, and only temporarily filled lakes and river-beds connecting the Manych, a tributary of the Don, with the Kuma, a tributary of the Caspian. It is supposed to be a relic of the former post-Pliocene connexion between the Black Sea and the Caspian, and is accepted by most geographers as a natural frontier between Europe and Asia, while others take for the boundary the sinuous line of the main water-parting of the Caucasus Range. The southern frontier of *Caucasia* is a line which has been shifted several times during the last century, and now, separating *Caucasia* from Asia Minor and Persia, runs from a spot situated on the Black Sea 17 miles S. of Batum in a south-westerly and easterly direction to the Ararat, and thence along the Araxes river to within 30 miles from its junction with the Kurá, where the boundary turns once more to the S.E., reaching the Caspian Sea at Astará (lat. 37° 45' N.). This large territory, covering 180,843 sq. miles and having in 1897, 9,248,695 inhabitants (54 per sq. m.), may be subdivided into four natural zones: (i.) the plains in the N. of the Great Caucasus Range, or North *Caucasia*; (ii.) the Caucasus Range and the highlands of Daghestan; (iii.) the valley of the Rion and the Kura, between the main ridge and the escarpments of the Anti-Caucasus; and (iv.) the highlands of Transcaucasia.

I. The *Plains of North Caucasasia*, which include most of the provinces of Kubañ, Stavropol, and Terek, gently slope from the foot of the Caucasus Range towards the Kuma-Manych depression, the Sea of Azov, and the

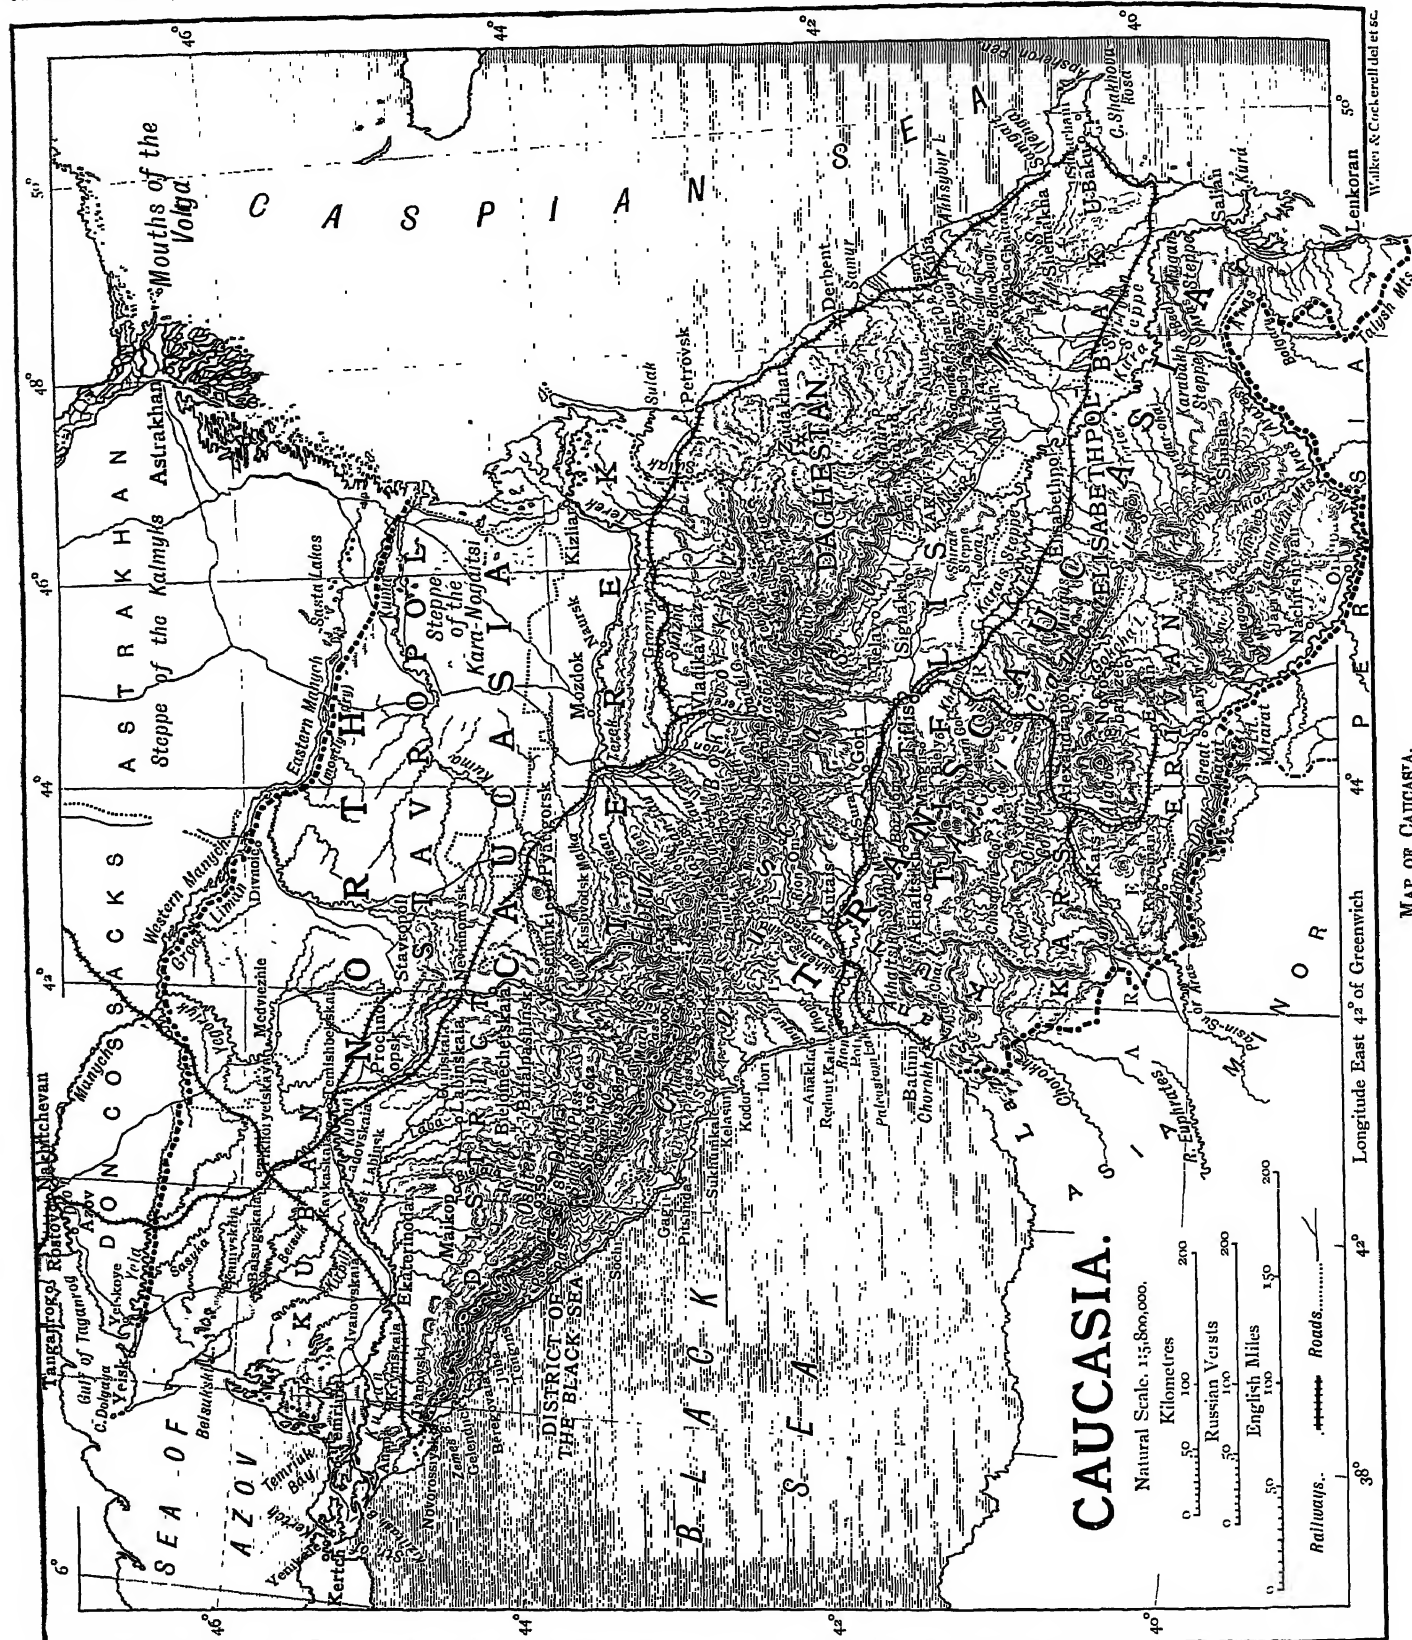

Caspian. They consist of horizontal Tertiary strata, and only in their centre portion do they reach altitudes of from 2000 to 2500 ft., as in the "Stavropol plateau," which spreads northwards, separating the tributaries of the Kubañ from those of the Terek and the Kuma. Thick forests clothe them towards the foot-hills of the Caucasus, while in the W. they merge into the prairies of South Russia, or end in marshy grounds clothed with rushes in the wide delta of the Kubañ; in the N. and E. they become stony and sandy dry steppes as one approaches the Manych and the coasts of the Caspian.

The climate is continental, *i.e.*, very hot in the summer and cold in the winter, and very dry, the yearly rainfall being only from 30 to 10 inches. The average temperatures at Stavropol (alt. 1919 ft.) are: year 47° Fahr., January 24°, July 70°, yearly rainfall 29.8 inches. But the soil of these prairies is very fertile, and they have now a Russian population of nearly 2,800,000, composed of Cossacks and peasant immigrants, chiefly settled on the main rivers and grouped in wealthy, populous villages. They carry on agriculture—wheat-growing on a large scale, with the aid of modern machinery, North *Caucasia* becoming an important grain-exporting country,—and also cattle and horse breeding; vine culture is widely spread on the low levels, and a variety of domestic trades is rapidly spreading in the villages. The higher portions of these plains, deeply ravined by the upper tributaries of the above-mentioned rivers, are inhabited by a variety of Caucasian branches: the Kabardians and the Cherkess in the W., the Ossets in the middle, and a variety of branches from Daghestan described under the general name of Chechens, while nomadic Nogai Tatars and some Turkomans occupy the steppes.

II. The *Caucasus Range*, running N.W. to S.E. from the Strait of Kerch to the Caspian Sea, on a length of 940 miles (700 miles in a straight line), varying in width from 30 to 130 miles, and covering a surface of 12,000 sq. miles, appears to be of a more and more complicated structure in proportion as more accurate surveys are made. A new survey on the scale of 1½ inches to the mile was in 1901 being made with great accuracy (especially in Central *Caucasus*) in lieu of the previous 3½ miles to the inch scale.

A. In its *western* portion, from the Sea of Azov to the Elbruz, which runs parallel to, and at a short distance from, the N.E. coast of the Black Sea, it appears rather as a succession of parallel ridges, disposed *en échelon*, sending out on their southern slopes numerous spurs of great steepness, which reach the very coast of the Black Sea. On its northern slope the main range is accompanied by another ridge of mountains, the Bokovoi Khrebet, or "side range," which is composed of uplifted stratified rocks gently sloping northwards and having their escarpments turned towards the main range. The rivers which rise on the slopes of the latter flow first in longitudinal valleys and then pierce the thickly forest-clad side range in a series of most picturesque gorges and valleys. The amount of rain received by this region, which is only 20 inches at the Sea of Azov, reaches 40 inches along the Caucasus Range as far as the 46th degree of E. long., and from 60 to 80 inches in the Black Sea coast region (80 inches at Sochi). Consequently the south-western slopes of the Caucasus are covered with a luxuriant, almost sub-tropical, vegetation. Unfortunately, in the narrow coast regions moisture and heat result in the prevalence of very severe malarial fevers, presenting a real obstacle to immigration. The altitude of the snow-line in Western *Caucasus* is about 9000 ft. on the Fisht or Oshten group, and to the east of it the crest of the main ridge is crowned with perpetual snow and numerous hanging glaciers, while larger glaciers creep down the main valleys. The southern slope, however, is extremely steep and often presents almost vertical walls, 2000 to 3000 ft. high, rendering the passes extremely difficult. As a rule the passes lie at a great height, and apart from those lower ones which are known at the north-western extremity of the range, they are few, namely, Pseshko, from Pitsunda to the head-waters of the Laba (6870 ft.); Marukh (11,000 ft.); Klukor (9075 ft.), along which a bridle-path is now made to connect Sukhum with Batalpashinsk; and Nakhar (9617 ft.), also leading to the upper Kubañ. The main peaks of that part of the range are—Fisht or Oshten (9359 feet), Shugus (10,642), and Psysh (12,427). The former inhabitants of this region—Kabardians and a few Adyghe (or Cherkess, Circassians)—are partly settled now on the northern foot-hills, while Abkhazians occupy the south-western slope. The great bulk, however, of the native population have been compelled by the force of

arms to abandon their mountain villages, and rather than settle out of the country and emigrated to Turkey, constituting now the *bashi-bazouks*. As to the Russians, they have but a few small on the northern plains, as they were offered, preferred to be driven

towns along the coast, namely, Novorossiysk (16,208 inhabitants), Sukhum-kale (7809), and Sochi, the first named of which is connected by a branch railway with the great line of North Caucasia, and becomes a great corn-exporting seaport. Immense beds of coal have been discovered at Ochenchiri.

B. *Middle Caucasus*, from the sources of the Kubañ to those of the Ardon, i.e., from Mt. Elbruz to the Adai-khokh, is the highest portion of the range. Immense snow-clad ridges of mountains shoot off from the main range on its southern slope, at small angles with its main axis, forming large longitudinal valleys (Legchum, Racha,

and so on), inhabited by various branches of the Georgian stem. On the northern slope the side range (Bokovoi Khrebet) runs parallel to the main one, often exceeding it in altitude, but it is cut through by many rivers, which, as in the W. Caucasus, also flow for some distance in longitudinal valleys between the two ridges, and then pierce it, to find an issue to the northern plains. Many spurs also shoot off the main range, and it is usually on these spurs that the highest peaks—some of them of volcanic origin, as Elbruz and Kazbek—stand, covered with snow, and sending down mighty glaciers. The highest peaks of the Caucasus are met with in this division, there being no fewer than 20 peaks higher than Mont Blanc. The chief are in close succession: Elbruz, or Minghi-tau (18,470 ft.), Ushba (15,445), Tikhtenghen, Gistola, Tetnuld (15,914), Adysh (16,291), Great Shkhara (17,049) and Little, Koshtan-tau (16,881), Janghi-tau (16,564), Dykh-tau (17,054), Pasis-mta, Adai-khokh (15,244), Tepli (14,510), Himarai-khokh (15,673), and Kazbek (16,546). None of the passes in this portion of the Caucasus is below 12,000 ft., and only to the E. of Kazbek the Mamisson Pass, from Kutais to Vladikavkaz, known as the "Military Ossetian Road," lies at an altitude of 9390 ft. Mighty snow-clad ridges—Svanetian, Leghum, Rachinsky—shoot also to the W. and W.S.W. on the southern slope of the main chain, forming elevated longitudinal valleys.

As a rule, the snow-line lies at heights of from 11,000 to 12,000 ft., and although it remains a fact that the Caucasus, taking into account its dimensions and altitude, has fewer glaciers in proportion than the Alps, the excursions of Western European and Russian Alpinists, and especially the newest detailed survey, have disclosed in this part of the Caucasus, between the main range and the secondary ones, wide areas covered with perpetual snow and feeding mighty glaciers, not second in size to those of the Alps. It is estimated that there are in this region no fewer than 183 first-class and 679 second-class glaciers,—the number of the latter in the whole chain probably being between 900 and 1000. However, the Caucasian glaciers do not creep so low as those of the Alps. The best known of them are: Bizinghi (Shkhara and Dykh-tau), 11 miles long, reaching at its lower end the altitude of 6539 ft.; Dykh-su, in the same locality, 7 m. long (6649 ft.); Karagom, $6\frac{1}{2}$ m. long, flowing from the Adai-khokh and reaching the 5702 ft. level (lowest in Caucasasia); Tsanner, creeping from the Tetnuld, 7 m. long (6835 ft.); Devdorak, from the Kazbek, $2\frac{1}{2}$ m. long (? 7531 ft.). Numerous traces of glaciation on a very large scale are found in all the valleys.

Farther eastwards the main range becomes much lower, and the highest peaks are grouped in the side range. They are: Tsmiakom-khokh (13,567), Zilga-khokh (12,645 ft.), Zikari (12,563), Choukhi (12,107), and Borbalo (10,807) in the main range. The rivers of the northern slope—the Ardon and the Terek—after short courses in longitudinal valleys, pierce the side range in most wild gorges. The whole chain narrows, however, in the meridian of Vladikavkaz, and it is crossed there by the well-known Cross Pass (Krestovaya; also named Gudur and Kobi Pass), along which goes the military road to Georgia, following the famous Darial gorge, which is pierced by the Terek across the side range.

C. It appears very probable that to the east of this gorge the Caucasus is crossed by other lines of upheaval which have a direction from S.W. to N.E. and may be considered as continuations of the Suram or Meskes Mountains and the Pontic Ridge. At any rate, from the Kazbek eastwards the Caucasus changes its character. It has to the N. of the main range a wide Alpine land, Daghestan, composed of several ridges—Andi, Bozdagh, and others—all running towards E.N.E., with many treeless and dry plateaux between them, so that Daghestan may be considered by the orographer as a fragment of the Transcaucasian plateaux, separated from the main body by the broad valley of the Kura, while the geologist sees in it a series of folds of Jurassic and Cretaceous deposits. As to the main range, it continues in the same south-easterly direction, but its granite axis disappears and Palaeozoic slates spread on both the southern and the northern slopes. The crest of the main ridge becomes lower and has less protruding peaks. Glaciers are scarce upon it, but attain a great development on the ridges lying to the north of the main one. The chief passes across the latter are Kodor (9300 ft.) and Satskheni, both leading from Tiflis to Daghestan. The chief peaks of the main ridge do not reach altitudes of 12,000 ft., and are, besides Borbalo, Antsal (11,742), and Shavi-kilde (11,314); while in the Andi ridge are Tebulos-mta (14,781), Donos-mta (13,736), Kachu (14,027), and Balakuri in the Bozdagh ridge.

D. From the 47th degree of longitude (head of Samur) to the Baba-dagh Peak the main range rises once more in altitude, reaching 13,764 ft. in Thfan-dagh, 14,772 in Bazar-dynuz or Kichen-dagh, and 13,951 ft. in Shah-dagh, while the Gudur Pass lies at an altitude of 10,118 ft. and the Salavat Pass (military road of Akhte) at 9283 ft. In this portion of the Caucasus are the last glaciers. Beyond the Baba-dagh (11,934)

no summit rises above 9000 ft.; the Alty-agach Pass is at an altitude of only 4354 ft.; the crest is devoid of perpetual snow. Finally, the great ridge is lost in hills as it approaches the Caspian, to be continued, however, under the sea as a submarine swelling, and to reappear in the Transcaspien territory under the name of Kopet-dagh.

The high valleys of the Caucasus are populated by Cherkess (Adyghe) in the W., Svanetians, Ossets, Pshaves, and Khevsurs in the middle, and a variety of stems, of which the Lezghians and the Cherkess are the most numerous, in Daghestan. Every available patch in the mountain valleys is used for culture, the soil having often to be carried on the shoulders to a great height, and the villages (*auls*) are built house above house upon the steep mountain slopes. Unfortunately, the Cherkess having been driven out of the country, their abodes in Western Caucasus remain unoccupied, while the various Georgian stems of the middle Caucasus, pressed by want of land available for culture, have had much to suffer from the feudal servitude under which they remained till 1868.

III. The *Broad Valley* which runs N.W. to S.E. between the Great Caucasus and the escarpments of the Anti-Caucasus is the most fertile and the most populated portion of Caucasus. It broadly corresponds with the provinces of Kutais, Tiflis, Elisabethpol, and Baku, and has a population of over 3,000,000. It is watered in the W. by the Rion, affluent of the Black Sea, and its tributaries, and in the E. by the Kura, affluent of the Caspian (with its two tributaries, Yora, Alazan), and the lower Araxes. The Suram or Meskes Mountains, 3000 to 5000 feet high, separate the two drainage areas. This Broad Valley was peopled in a remote antiquity with Greek colonists, was later the seat of powerful Georgian kingdoms, and has been for centuries the stronghold of Caucasasia against invasions from the east and south. It is thickly peopled, chiefly with Georgian stems (Gurians, Imeretians, Mingrelians, Svanes) in the valley of the Rion, and Georgians mixed with Armenians in the valley of the Kura, while the steppes spreading along the lower course of the latter river are occupied by various Turko-Tatars. In the agricultural region the land is so well cultivated that it attains a fabulously high selling value, increased now by the manganese and copper mines of the Rion and the extremely rich naphtha wells of Baku. The drainage area of the Rion (province of Kutais), as well as the Sukhum-kale coast region and the basin of the lower Chorokh (Batum district), is covered with spurs of the Caucasus, the Meskes Mountains and the Wakhan ridge, with a broad triangular delta of the Rion between them. Its climate is extremely hot, and the amounts of rain are very considerable, so as to reach a yearly average amount of 80 in. at Batum, from 80 to 60 in. round Poti, and from 60 to 40 in. elsewhere. Farther east, in the valley of the Kura, the climate is, however, much drier and more continental, the averages for Tiflis being: year 55°, January 32°·5, July 77°, rainfall 20 in.; and for Baku, year 59°, January 39°, July 80°, rainfall 10 in. The chief towns of Caucasasia are situated in this valley, namely, Batum (28,512 inhabitants) and Poti (7666), the two chief ports on the Black Sea; Kutais (34,492), on the Rion; Tiflis (160,645); and Baku (112,253).

IV. The *Highlands of Transcaucasia* present three distinct regions: the plateaux of Asia Minor and of Armenia, and the Lenkoran region on the Caspian. The first-named plateau, intersected by the Pontic Ridge (from 10,000 to 12,152 ft. high), the Arjar and the Arsian ridges (10,000 to 11,000 ft.), and watered by the Chorokh, is chiefly inhabited by Mussulman Georgians (Lazes), who grow rice, millet, wheat, and all sorts of fruit. The Armenian plateau, separated by the deep valley of the Araxes from its continuation in Turkish Armenia, has mostly altitudes of from 5000 to 6000 feet. It consists of granites covered with Azoic, Devonian, Carboniferous,

Tertiary, and Glacial deposits, and is deeply ravined by rivers. Mountain ranges, which have their bases on the surface of the plateau, and reach altitudes of from 8000 to 9500 ft., and occasionally more, intersect it in various directions; while huge Trachitic masses, such as the Alaghöz (13,436 ft.) and the Ararat (17,212 ft.), rise above its undulating and ravined surface. The climate is severe on the plateau and very hot in the deeper valleys. Thus, even at Erivan (40° 15' N.), at an altitude of 3230 ft., the averages are as low as these: year 51° Fahr., January 16°, July 75°; and at higher altitudes the winters are still more severe. The yearly amount of rain is only from 9 to 24 inches. The population consists of Armenians, Tatars, Turks, Kurds, Turkomans, and Russians, who do not number, however, more than 15,000. Cattle-breeding and some agriculture are carried on on the plateau, while cotton, rice, and all sorts of fruit are grown in the deeper valleys. As to the Lenkoran district, which lies on the slopes of the Azerbaijani plateau, its climate is extremely warm and moist. The temperature of the coldest month is 37° at Lenkoran, and the yearly amount of rain exceeds 40 inches.

The population of Caucasia has been rapidly increasing, and it reached, in 1897, 9,248,695 (4,891,054 men and 4,357,641 women), of whom 996,248 lived in towns. Of this population, 3,786,784 lived in the three North Caucasian provinces and 5,461,911 in Transcaucasia (including Daghestan). The population belongs to a great variety of stems, but it has been proved by modern ethnological research, especially by Baron Uslar, Schiefner, and Zagursky, that the former opinion as to the existence of 150 or 300 different nationalities was exaggerated. Many of the languages that are spoken in different parts of the Caucasus have proved to be but local dialects of a few distinct languages. According to the classification established by Baron Uslar and Zagursky, the different nationalities of Caucasia may be classed as they are given in the table on this page.

Most of the Russians and the Georgians, with the exception of the Moslem Lazes, belong to the Greek Orthodox Church (4,076,173 according to estimates for 1886-97); but considerable numbers of the former are Nonconformists of different denominations (121,824, but probably much more). The Armenians, with the exception of a small number of Catholics (34,008), are Gregorians (979,566). The mountaineers, as also the Turks and the Tatars, are nearly all Sunnite Mussulmans (2,021,334), and the Persians Shiite Mussulmans (884,131), while the Mongols are Buddhists (20,311), and the Kurds are Yezids (14,979).

The movement of population in 1897 was, 350,457 births (3.9 per cent.), and 226,295 deaths (2.5 per cent.), showing thus an increase of 1.4 per cent. (124,162).

Agriculture is the main occupation of the settled inhabitants, and cattle-breeding among the nomads. The total crops for 1897 were: 9,322,000 quarters of wheat and other cereals in Northern Caucasia, and 11,910,000 quarters in Transcaucasia, it being estimated that in an average year Caucasia has an available surplus of 3,000,000 tons of cereals. The yearly crop of raw cotton (chiefly Armenian), grown mostly in Eastern Transcaucasia, is estimated at 10,000 tons, and of tobacco at 36,000,000 lbs. Various sorts of grass (rye-grass, lucerne, &c.) are widely cultivated in Transcaucasia, and nearly 60 cwts. of madder are obtained. The culture of melons and water-melons, as also of the sunflower (for oil), is widely spread; and it is estimated that nearly 54,000 acres are under vineyards in North Caucasia and 278,000 acres in Transcaucasia, giving an aggregate of 30,000,000 gallons of wine. Gardening is brought to a high degree of perfection, and the silkworm is bred so as to obtain every year over 100,000 cwts. of cocoons and to give occupation to about twenty steam silk unwinding mills and great numbers of small native ones. The gathering of the liquorice root (about 600,000 cwt.), of laurel leaves, &c., is worthy of notice. The culture of the tea-tree has been introduced.

The prairies and steppes of both Northern Caucasia and Transcaucasia are stocked with live stock, and Caucasia has 1,017,460 horses, 124,360 donkeys and mules, 5,883,000 horned cattle, 14,100,000 sheep, 960,000 swine, and 24,400 camels.

In their domestic trades many of the inhabitants of Caucasia, including the mountaineers, attain a very high degree of perfection, and their produce is mostly characterized by a high artistic taste. Carpets, woollen cloth, various goods made out of the finest goat wool, and the *burkas*, or Circassian fur cloaks, are among the chief items. Next come various goods made out of wood and metals (small-arms in Daghestan, chiselled silver work at

Akhaltzykh, &c.), of leather (saddlery, decorated girdles, &c.), and also the making of various sorts of oil, and so on.

The mining industry is rapidly growing in importance. Copper ore is extracted in the governments of Tiflis, Elisabethpol, Kutais, and Erivan (85,000 tons of ore, 2700 tons of copper in 1897); silver ore in Terek, Kubañ, and Kutais (8500 tons); iron ore in Elisabethpol to a small extent; and manganese ore in Kutais (230,000 tons); also some cobalt, sulphur, and quicksilver. The extraction of coal in Kubañ and Kutais is still in its infancy (22,000 tons). Naphtha, on the contrary, is obtained in very large and ever-growing quantities (6,854,000 tons in Baku, 295,000 tons in Terek, 2320 tons in Kubañ, and 450 tons in Tiflis and Daghestan). About 241,000 tons of rock salt in Erivan and Kars, and from 10,000 to 18,000 tons of lake salt, are extracted every year.

The industries are represented by 26,811 factories and workshops,

giving occupation to 91,289 persons and yielding a yearly production valued at £6,832,800.

The schools in Caucasia were in 1897: fourteen gymnasia and progymnasias for boys (6196 pupils) and twenty for girls (7247), 10 *Realschulen* (3176), five schools for teachers (389), four town (732), five mountaineers (638), three marine (181), fourteen professional schools (987), and 150 private schools (7272 pupils). For primary education there were 1380 schools (88,182 pupils), all under the Ministry of Public Education. There were, besides, nineteen secondary and 1308 primary schools kept by Cossacks and under other departments, and having an aggregate of 42,671 boys and 13,520 girls. In the Mussulman and Jewish schools there were 2235 and 1360 pupils respectively.

Caucasia has two main lines of railways, both running N.W. to S.E., in the N. and in the S. of the Caucasus range. The former, starting at Rostov on the Don, runs to Vladikavkaz (402 miles), and thence to Petrovsk on the Caspian Sea (180 miles), whence it has been continued along the sea-coast, *via* Derbent, to Baku (234 miles). One branch connects the Tikhoryetskaya station of this line with Novorossiysk on the Black Sea (168 miles), and is continued north-eastwards to Tsaritsyn on the Volga (333 miles); two others connect the watering-towns Kislovodsk and Pyatigorsk with the main line. A third branch to Kizlyar is being built. The Transcaucasian line, connected with the first-named at its far eastern end only, *i.e.*, at Baku, begins at Batum and Poti on the Black Sea and runs, through the Suram tunnel, to Tiflis and past Elisabethpol to Baku (400 miles from Batum). It has small branches to Kutais, to Tkivbuli coal-mines, to Chiaturi and Darkweti, to Stavropol, with the main line at Kavkazskaya station (96 miles), and to Borzhom, while a line of great strategic importance has been built from Tiflis to Kars (185 miles).

The Transcaucasian line and Tiflis can thus only be reached by rail on a very circuitous line *via* Baku. The usual way of communication is by post-horses from Vladikavkaz to Tiflis, *via* the Darial gorge. A road has been made from Vladikavkaz to Kutais *via* the Mamisson Pass. The other passes across the Caucasus (see above) are mere bridle-paths.

The chief ports of Caucasia are Batum, Poti, Novorossiysk and Sukhum on the Black Sea, Baku and Petrovsk on the Caspian. The exports from the Black Sea ports reach about 60,000,000 roubles (£6,000,000), and consist chiefly of naphtha, manganese ore, linseed, raw silk and wool, liquorice root, corn, salt, and timber. The chief imports, about £1,000,000 worth, are tin and cheap timber (for naphtha boxes), iron, steel, tin, lead, chemicals, glass, china, and machinery. The maritime trade with Persia averages yearly £850,000 worth for the exports (naphtha, cottons, metals) and £760,000 for the imports (rice, carpets, dried fruit), to which items those of the inland trade with Persia (about £400,000 of imports and £100,000 of exports) have to be added. The internal trade of Caucasia with Russia is very considerable both by land and by sea. The ports of Caucasia were visited in 1892 by 1165 foreign ships and 4073 engaged in cabotage.

For the administrative subdivisions of Caucasia, see RUSSIA.

AUTHORITIES.—The literature of the Caucasus is immense. The best general description in a West European language is, according to Stebnitsky and Masalsky, that of ELISEE RECLUS in *Geographie Universelle* (English version by KEANE), to which Gen. STEBNITSKY has made most careful annotations in the Caucasian *Zapiski*. There may also be mentioned now, by way of supplementing the list of works quoted in the ninth edition: FRESHFIELD and others. *The Exploration of the Caucasus*. 2 vols. London and New York, 1896.—V. SELLA and D. VALLINO. *Nel Caucaso Centrale*. Turin, 1890.—ABICH. *Geologische Forschungen*.—G. RADDE. *Vier Vorträge*. 1874.—E. CHANTRE. *Recherches Anthropologiques dans le Caucase*. 1885-87.—R. ERCKERT. *Der Caucasus und seine Völker*. 1885.—Articles "Caucasus," &c., in SEMENOFF'S *Geographical Dictionary (Slovar)*, and in *Russkiy Encyclopedicheskiy Slovar* (1894), by V. MOSALSKY, MILLER, &c.; *Zhivopisnaya Rossiya*, vol. ix.; also by LITVOROFF, PROTSENKO, V. KRIVENKO, NADEZHIN, EGIAZAROFF (institutions), O. MILLER and M. KOVALEVSKY (ancient law).—The *Zapiski* and the *Izvestia* of the Caucasian and the Russian Geographical Societies and *Sbornik Materialov* are mines of information, while the *Kavkazskiy Kalendar*, published every year at Tiflis, contains, besides recent statistics and maps, full bibliographical indexes (also lately in the St. Petersburg *Izvestia*).—The local publications of the separate provinces, and the reviews *Zemlevyedenie* (Moscow), *Etnograficheskoye Obozreniye*, &c., may also be consulted.—The best maps (general, orographical, relief, ethnographical, &c.) are those issued from the Military Topographical Depot of the General Staff.

(P. A. K.)

Caudebec-lès-Elbeuf, a French town, in the arrondissement of Rouen, department of Seine Inférieure, 12 miles S. by W. of Rouen, on railway to Louviers. It is practically a suburb of Elbeuf, and has important manu-

factures of cloth and wool-spinning. Population (1881), 11,290; (1901), 6981.

Caudry, a town and railway station of France, in the department of Nord, arrondissement of Cambrai, 39 miles in direct line S.S.E. of Lille. It has important manufactures of tulle and lace: others are muslin, guipure, chicory, and sugar. Population (1881), 4956; (1901), 9934.

Caulfield, a borough (created 13th April 1901) of Victoria, Australia, in the county of Bourke, 7½ miles E. of Melbourne, with which it is connected by rail. It has a fine racecourse, the headquarters of the Victorian Amateur Turf Club. Population (1891), 8005; (1901), 9607.

Cautin, a province of southern Chile, situated between 38° 25' and 39° 35' S. lat., 71° 00' and 73° 25' W. long. Its area is 3120 square miles. The population in 1895 was 78,221. It is divided into two departments, Temuco and Imperial. In 1898 there were 1837 births, 456 marriages, and 1510 deaths. Temuco is the capital.

Cava dei Tirreni, a town, bishop's see, and summer resort of the province of Salerno, Campania, Italy, 6 miles N.W. from Salerno by the railway to Naples. Population, about 16,250.

Cavagnari, Sir Pierre Louis Napoleon (1841-1879), British military administrator, was by birth a Frenchman, being the son of a French general by his marriage with an Irish lady, and was born at Stenay, in the department of the Meuse, 4th July 1841. He nevertheless obtained naturalization as an Englishman and entered the military service of the East India Company. After passing through the college at Addiscombe, he served through the Oudh campaign against the mutineers in 1858 and 1859. In 1861 he was appointed an assistant commissioner in the Punjab, and in 1877 became deputy commissioner of Peshawar, and took part in several expeditions against the hill tribes. In 1878 he was attached to the staff of the British embassy to Kabul, which the Afghans refused to allow to proceed. In May 1879, after the death of the Amir Sher Ali, Cavagnari negotiated and signed the treaty of Gandamak with his successor, Yakub Khan. By this the Afghans agreed to admit a British resident at Kabul, and the post was conferred on Cavagnari, who also received the Star of India and was made a K.C.B. He took up his residence in July, and for a time all seemed to go well, but on 3rd September Cavagnari and the other European members of the embassy were massacred in a sudden rising of mutinous Afghan troops. (See AFGHANISTAN.)

Cavallotti, Felice (1842-1898), Italian politician, was born at Milan, 6th November 1842. In 1860 and 1866 he fought with the Garibaldian Corps, but first attained notoriety by his anti-monarchical lampoons in the *Gazzetta di Milano* and in the *Gazzettina Rosa* between 1866 and 1872. Elected to Parliament as deputy for Cortelona in the latter year, he took the oath of allegiance after having publicly impugned its validity. Eloquence and turbulent combativeness in and out of Parliament secured for him the leadership of the Extreme Left on the death of Bertani in 1886. During his twelve years' leadership his party increased in number from twenty to seventy, and at the time of his death his parliamentary influence was greater than ever before. Though ambitious and addicted to defamatory methods of personal attack which sometimes savoured of political blackmail, Cavallotti's eloquent advocacy of democratic reform, and apparent generosity of sentiment, secured for him a popularity surpassed by

that of no contemporary save Crispi. Services rendered in the cholera epidemic of 1885, his numerous lawsuits and thirty-three duels, his bitter campaign against Crispi, and his championship of French interests, combined to enhance his notoriety and to increase his political influence. By skilful alliances with the marquis di Rudini he more than once obtained practical control of the Italian Government, and exacted notable concessions to Radical demands. He died on 6th March 1898, the House of Savoy losing a relentless foe and the revolutionary elements in Italy a gifted, if not entirely trustworthy leader. (H. W. S.)

Cavalry.—The derivation of the word cavalry is quaintly given in the oldest English work which deals exclusively with the subject: "Cavalerie, so called of Cavallo, which in the Italian and Spanish signifieth a horse, derived from the Latin word Caballus, and this from the Greek, καβάλλης." Ideal cavalry consists of a body of trained and disciplined horsemen, mounted on sound and well-broken horses, under the command of efficient officers. The weapons of cavalry are now, almost universally, a magazine carbine, sighted to about 2000 yards, and *l'arme blanche*, that is, the sword and the lance, although the use of the latter weapon is not general in all cavalry in all European armies. The rôle of cavalry is in the offensive: it supplies the eyes and ears of the army; it acts as a veil to screen the disposition of its comrades of other arms, as was well illustrated by the Germans in the campaign of 1870; and it serves as a hammer to clinch a victory and turn the retreat of a shaken foe into a disastrous rout. Murat's pursuit of the Germans after Jena is a brilliant example of this form of cavalry action. It forms a shield and sometimes a scapegoat to sacrifice itself, so that time may be gained to enable other arms to rally or retreat, as was shown by the Austrian cavalry at Königgrätz, and by the French at Wörth and at Sedan. Napoleon lays down as a maxim that "it is the business of cavalry to follow up the victory and to prevent the beaten enemy from rallying," and this is the keynote of the action of victorious cavalry on a stricken field. Another golden rule which has to be impressed on every trooper is that with "the enemy once found touch must never be lost." Denison, in his *History of Cavalry*, quotes Murat's pursuit of the retreating Russians beyond Moscow, when he resolutely set his face towards Asia in spite of every discouragement, as one of the grandest examples that history records.

Improvements in the firearms of the present day have rendered a successful cavalry charge upon unshaken infantry only possible under abnormal conditions, and it is in taking advantage of cover, and in seizing the fleeting opportunities of surprise, that the cavalry charge will depend for great results. It was the sudden and unexpected charge of Kellerman's cuirassiers at Marengo that turned the triumphant advance of the Austrians into a rout of far-reaching and disastrous consequences, and there may yet occur chances of successful enterprise of this description for well-trained cavalry under a bold and vigilant commander, though such golden opportunities seem likely to be few and far between. At the same time, the very improvements in firearms that make the charge difficult have conferred on cavalry an independence and self-reliance hitherto unknown. Associated with mobile horse artillery, galloping quick-firing guns, machine guns, and perhaps mounted infantry and cyclists, cavalry should now be able to travel far and fast, and, so long as supplies are forthcoming, to render itself to some degree independent of the slow-moving infantry; thus rapid raids may be carried out, as was so well done in the American war

by both Federals and Confederates, and positions may be seized and turning movements effected that were formerly impossible. The German uhlans in 1870, whose only firearm was a pistol, were constantly checked by French franc-tireurs, and were obliged to await the arrival of supporting infantry before they could advance. This could hardly occur nowadays.

The individual cavalryman should be able to ride and shoot, to find his way across country, to scout in such a way as to see without being seen, and to report intelligently what he has seen, to shift for himself and for his horse under all conditions, and last, but not least, to be master of his weapons. Intelligent, active, healthy men who can do all this are the right material for cavalry. The recruit having been medically passed, is put through a course of gymnastics, at the same time being taught to groom his horse and to clean his kit. Riding and foot-drill follow; he is taught the sword, lance, and carbine exercises, and how to perform the various and complicated evolutions of increasing and diminishing the front, &c., which still obtain in Great Britain, though much simplified in other countries. In about six months he should be thoroughly trained on foot. He also goes through a recruit's musketry training during his first year, consisting of preliminary drills, practices, and lectures, followed by the firing of 200 rounds at a target. After this he becomes a trained soldier, and as such undergoes an annual course of squadron training, riding, and musketry. There are, besides, special courses open to such men as are selected as suitable in pioneering, horse-shoeing, cooking, saddling, sketching, signalling, first aid to wounded, and working the machine gun, as well as a voluntary school of elementary education. Squadron training is a course of instruction under the squadron commander which lasts about two months every year, in which the soldier should be thoroughly taught his duties in the field and camp; in fact, made efficient for war.

The whole secret of teaching a man to ride is to give him confidence, without which he will never develop into a dashing horseman. Every endeavour should be made to raise the pupil's courage, and care taken never to damp it; experience shows that the recruit who has been allowed to use his stirrups and to cling to his wallets or saddle with all his might, until he has gained the art of balance and acquired confidence, will very soon be proud to ride with crossed stirrups, loose reins, and folded arms. Lessons should not exceed an hour, and half an hour with crossed stirrups is ample. All work should be gradual: first the walk, then the trot, then the canter. The details of the ride will be found in *Cavalry Drill*, 1898, page 36. Briefly, the recruit will learn the turns, circles, inclines, bending lesson, passaging, &c., finally jumping and post practice. In four months he should begin to learn to wield his weapons—to cut, thrust, and guard sword exercise, pursuing practice, lance exercise, &c. In six months he should be fit to take his place in the ranks.

The young horse on arrival in barracks is examined by the veterinary surgeon, and if free from contagious disease is sent to the stable set apart for the young horses, where he is put on soft food and given gentle exercise, being quietly led about for the first six weeks until he has sufficiently improved in condition to commence his training. This consists of steady lunging on a cavesson for about a fortnight for ten minutes to half an hour a day until he gets his paces. In addition he must be regularly exercised for an hour a day. He will then be quietly saddled, and next mounted and dismounted, then led round on a cavesson with a man on his back, and then ridden without cavesson at a walk, then a trot. He is gradually taught to bend, to rein back,

to passage, and to make the turns and circles; after this he will be taught to canter. All this having been done on the bridoon or snaffle-rein, he will now be bitted, steady straightforward work being done for about a fortnight so as not to spoil his mouth. The drill of the ride is gradually taken up, and the horse is accustomed to carry the sword and the carbine bucket. After about six months' training he should be taught to jump, first of his own accord without a rider, and then mounted. He must be trained to stand fire, and after about eight months to go down the heads and posts. Finally, he may work with the other young horses in the field; and after twelve months he should be fit to take his place in the ranks, as a five- or six-year-old, as the case may be. An article in the "Badminton Library" volume on *Riding*, by Captain Robert Weir, gives an excellent description of how to train young horses. Throughout his training the horse must be encouraged, lessons being short, and everything done as quietly and gently as possible. "Never act with anger towards a horse is the first and best precept that can be impressed upon the mind." Xenophon wrote this twenty-three centuries ago, and it is as true now as it was in his time.

Generally speaking—for war naturally creates an exception—the supply of troop horses for the British cavalry comes principally, but by no means exclusively, from Ireland. They are bought at ages of from rising 4 to 7 (usually rising 4 to 5 and untrained); their height ranges from 15.2 to 16 hands, and the price paid is, as a rule, from £30 to £40. The remount department, with which the horse supply rests, consists of the inspector-general of remounts, 3 assistant purchasing officers, 2 staff captains who have charge of the remount depots at Woolwich and Dublin, 2 captains and quartermasters of the Army Service Corps who deal with forage, &c., and 3 veterinary surgeons. The horses are sent direct to their destined regiments, or temporarily retained at one of the two remount depots at Woolwich or Dublin. For purposes of supply in time of war there is a system of registration which was introduced by General Ravenhill in 1892, by which a retaining fee of 10s. per horse per annum is paid to owners on condition that they produce the horse at forty-eight hours' notice, or render themselves liable to a fine of £50. The price at which each horse is to be bought, if taken, is arranged between the owner and inspector from year to year; the agreement may be terminated at six months' notice on either side. For purposes of registration Great Britain and Ireland are divided into fifty districts, to each of which a veterinary surgeon is attached. It is estimated that there are 3,000,000 horses in the British isles. Selected officers are also sent to foreign countries for the purchase of remounts when occasion demands. With regard to the supply of horses to foreign armies, some are obtained by purchase as in England, but many are bred at the Government haras or breeding establishments. Horses are, as a rule, well trained before being sent to their regiments, a system which prevents men from being taken from the ranks in order to break the young horses.

The same organization of cavalry holds good, with few exceptions, throughout the great military nations of the world. A cavalry division consists of 2 brigades;

Organization.

a brigade of 2 regiments (3 in the case of England); a regiment of 4 to 6 service squadrons and a depot squadron. In the British army there are only 3 service and 1 depot squadrons, and an English cavalry regiment meeting a foreign regiment in the field would consequently be outnumbered by from 150 to 450 men. The tactical unit is the squadron, which consists as a rule of 150 men, and is divided into four troops of roughly from 25 to 35 men, and each troop is divided into three or

four sections. The war establishment of an English cavalry brigade consists of the following:—

Staff—4 officers, 17 warrant N.C.O.s, and 19 men.
 3 Cavalry regiments—75 officers and 1518 men, 3 machine guns.
 1 Battery R.H.A.—6 officers, 176 men, 6 guns.
 Ammunition column—4 officers, 106 men.
 2 Companies mounted infantry—12 officers, 294 men, 2 machine guns.
 Supply column—5 officers, 120 men.
 Bearer company—3 officers, 94 men.
 Field hospital—5 officers, 56 men.
 Total, 114 officers and 2383 men.
 2448 Horses, of which 9 are pack and 556 draught.
 32 Two-horse vehicles, including 5 machine guns.
 82 Four-horse vehicles.
 22 Six-horse vehicles, including 6 R.H.A. guns.

Although the squadron system obtains throughout Europe, there are of course details of equipment which vary in different armies. Thus the Germans since the war of 1870 have armed the whole of their cavalry with lances, using hollow steel instead of ash or bamboo poles. The Austrians, on the other hand, since 1885 have abolished the lance; and the French have no lancers, but the front rank of their dragoons carry lances. In Great Britain, besides the regular lancer regiments, the front ranks of dragoon guards and dragoons are also armed with lances. The Russians have two lancer regiments of the guard, and vast numbers of Cossack lancers, but the 56 dragoon regiments of the line which form the main body of the Russian regular cavalry are armed with long rifles and bayonets. The Italians arm their first 10 regiments with lances. The remaining Italian cavalry carry carbines with a light bayonet, which when not wanted is inverted over the cleaning-rod. The French supplement their cavalry with infantry cyclists, using the folding cycle invented by their commander, Major Gerard. The machine can be folded up and slung on the back in thirty seconds. It is claimed by the French that the cycle has proved its usefulness for military purposes, and that wherever the roads are good and the country suitable they will play an important part in future wars. Other nations are beginning to follow suit, all using cyclists as messengers whenever possible, to save their horses. The Berthon boat accompanies German cavalry. In Great Britain two companies of mounted infantry are attached to a cavalry brigade; these are simply mounted riflemen, and are not expected to fight on horseback. A machine gun is attached to every British cavalry regiment and to each company of mounted infantry, but has not as yet been adopted by the cavalry of foreign nations. The French alone maintain the cuirass for war, unlike other nations who use it only for parade. The 13 regiments of cuirassiers are armed with straight swords, 47 inches long, and revolvers, and are also provided with 60 carbines per regiment. The Hungarian cavalry are all hussars. The Austrian cavalry consists of uhlans and dragoons. The Austrians supplement their cavalry with quick marching infantry, and 35 miles in a day is no unusual distance for Austrian foot to cover on manoeuvres. Signallers are trained to a great degree of proficiency in the British cavalry, but are little used by other nations. Automobiles and motors have been experimented with in both Austria and France for military purposes, and particularly for cavalry transport. The above are some of the points of difference of equipment that occur in the cavalry of Europe. Drill, except in the case of the Russian dragoons, is practically the same throughout, the great desideratum being to make it as simple as possible.

Yeomanry.—The first idea of yeomanry appears in 1745, when the gentlemen of Yorkshire raised a royal regiment of hunters to fight against Prince Charles Edward. The idea was resuscitated at the end of the 18th century, when Great Britain was in dread of an invasion by Napoleon.

The British yeomanry force now numbers some 11,000 men, whose annual training lasts about ten days a year. With so short a training great results are not to be expected, but it is wonderful how much is accomplished in the time, and men and horses are excellent. The Imperial Yeomanry employed in South Africa consisted of men specially enlisted for one year, or until the end of the war, to act as mounted infantry. (See also under ARMIES.) (W. A.-T.)

Cavan, an inland county of Ireland, province of Ulster.

Population.—The area of the administrative county in 1900 was 497,025 acres, of which 132,391 were tillage, 261,104 pasture, 127 fallow, 5281 plantation, 13,493 turf-bog, 4685 marsh, 12,375 barren mountain, and 37,569 water, roads, fences, &c. The new administrative county under the Local Government (Ireland) Act, 1898, is identical with the old judicial county. Population (1881), 129,476; (1891), 111,917; (1901), 97,368, of whom 49,982 were males and 47,386 females, divided as follows among the different religions:—Roman Catholics, 78,921; Protestant Episcopalians, 14,095; Presbyterians, 3256; Methodists, 981; other denominations, 115. The decrease of population between 1881 and 1891 was 13.56. The average number of persons to an acre was .23. The following table gives the degree of education in 1891:—

	Males.	Females.	Total.	Percentage.		
				R.C.	Pr. Epis.	Presb.
Read and write . .	86,866	35,391	73,257	68.3	82.9	87.9
Read only . . .	5,873	6,920	12,793	13.6	8.9	7.8
Illiterate . . .	8,591	7,692	16,283	18.1	8.2	4.8

In 1881 the percentage of illiterates among Roman Catholics was 25.2. In 1891 there were 7 superior schools, with 150 pupils (67 Roman Catholics and 83 Protestants), and 295 primary schools, with 17,314 pupils (13,879 Roman Catholics and 3435 Protestants). The number of pupils on the rolls of the national schools on 30th September 1899 was 18,953, of whom 15,248 were Roman Catholics and 3705 Protestants. The following table gives the numbers of births, deaths, and marriages in various years:—

Year.	Births.	Deaths.	Marriages.
1881	3099	2091	328
1891	2148	1826	377
1899	2003	1472	376

In 1899 the birth-rate per 1000 was 17.9, and the death-rate 13.2; the rate of illegitimacy was 1.5 per cent. of the total births. The total number of emigrants who left the county between 1st May 1851 and 31st December 1899 was 110,468, of whom 56,084 were males and 54,384 females. The following are the chief towns in the county, with their populations in 1891:—Cavan, 2968; Belurbet, 1675; Cootehill, 1593.

Administration.—The county is divided into two parliamentary divisions, East and West, the number of registered electors in 1900 being respectively 9372 and 9944. The rateable value in 1900 was £278,596. By the Local Government (Ireland) Act, 1898, the fiscal and administrative duties of the grand jury and (to a less extent) of other bodies were transferred to a county council, urban and rural district councils were established, and under that Act the county now comprises 2 urban and 7 rural sanitary districts.

Agriculture.—The following tables show the acreage under crops (including meadow and clover), and the amount of live stock, in 1881, 1891, 1895, and 1900:—

	Wheat.	Oats.	Barley, Beans, etc.	Potatoes.	Turnips.	Other Green Crops.	Meadow and Clover.	Flax.	Total.
1881	879	46,856	91	26,355	2915	2088	60,683	8807	148,169
1891	474	30,647	215	26,939	3421	3181	70,167	3332	147,876
1895	270	34,970	69	24,781	3551	2860	70,080	4944	141,475
1900	504	30,349	79	23,654	2921	3028	70,687	1219	132,391

For 1899 the total value of cereal and other crops was estimated by the Registrar-General at £906,713. The number of acres under pasture in 1881 was 246,441, and in 1900, 261,104.

	Horses and Mules.	Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.
1881	11,503	8131	104,797	14,359	94,753	15,442	510,318
1891	18,805	8798	121,243	25,684	51,084	20,842	594,589
1895	14,017	9242	117,488	18,251	51,797	18,581	649,093
1900	18,258	9870	121,908	25,562	56,171	18,284	737,820

The number of milch cows in 1891 was 45,224, and in 1900, 45,903. It is estimated that the total value of cattle, sheep, and pigs in 1899 was £1,650,243. In 1900 the number of holdings not exceeding 1 acre was 1169; between 1 and 5, 1447; between 5 and 15, 6916; between 15 and 30, 6913; between 30 and 50, 2471; between 50 and 100, 931; between 100 and 200, 222; between 200 and 500, 46; and above 500, 6—total, 20,121. The number of loans issued (the number of tenants being the same as the number of loans) under the Land Purchase Acts, 1885, 1891, and 1896, up to 31st March 1900, was 1854, amounting to £335,831. The number of loans sanctioned for agricultural improvements under sect. 31 of the Land Act, 1881, between 1882 and 1900, was 708, and the amount issued was £40,327. The total amount issued on loan for all classes of works under the Land Improvement Acts, from the commencement of operations in 1847 to 31st March 1900, was £55,690. (W. H. Po.)

Cavendish, George (1500-1562?), the biographer of Cardinal Wolsey, was the elder son of Thomas Cavendish, clerk of the pipe in the exchequer, and his wife, Alice Smith of Padbrook Hall. He was probably born at his father's manor of Cavendish, in Suffolk. Later the family resided in London, in the parish of St Alban's, Wood Street, where Thomas Cavendish died in 1524. Shortly after this event George married Margery Kemp, of Spains Hall, an heiress, and the niece of Sir Thomas More. About 1527 he entered the service of Cardinal Wolsey as gentleman-usher, and for the next three years he was divided from his wife, children, and estates, in the closest personal attendance on the great man. Cavendish was wholly devoted to Wolsey's interests, and also he saw in this appointment an opportunity to gratify his master-passion, a craving "to see and be acquainted with strangers, in especial with men in honour and authority." He was faithful to his master in disgrace, and showed the courage of the "loyal servitor." It is plain that he enjoyed Wolsey's closest confidence to the end, for after the cardinal's death George Cavendish was called before the Privy Council and closely examined as to Wolsey's latest acts and words. He gave his evidence so clearly and with so much natural dignity, that he won the applause of the hostile council, and the praise of being "a just and diligent servant." He was not allowed to suffer in pocket by his fidelity to his master, but retired, as it would seem, a wealthy man to his estate of Glemsford, in West Suffolk, in 1530. He was only thirty years of age, but his appetite for being acquainted with strange acts and persons was apparently sated, for we do not hear of his engaging in any more adventures. It is not to be doubted that Cavendish had taken down notes of Wolsey's conversation and movements, for many years passed before his biography was composed. At length, in 1557, he wrote it out in its final form. It was not, however, possible to publish it in the author's lifetime, but it was widely circulated in MS. Evidently one of these MSS. fell into Shakespeare's hands, for that poet made use of it in his *King Henry VIII.*, although it is excessive to say, as Singer has done, that Shakespeare "merely put Cavendish's language into verse." The book was first printed in 1641, in a garbled text, and under the title of *The Negotiations of Thomas Wolsey*. The genuine text, from contemporary MSS., was given to the world in 1810, and more fully in 1815. Until that time it was believed that the book was the composition of George Cavendish's

younger brother William, the founder of Chatsworth, who also was attached to Wolsey. Joseph Hunter proved this to be impossible, and definitely asserted the claim of George. The latter is believed to have died at Glemsford in or about 1562. The intrinsic value of Cavendish's *Life of Cardinal Wolsey* has long been perceived, for it is the sole authentic record of a multitude of events highly important in a particularly interesting section of the history of England. Its importance as a product of biographical

literature was first emphasized by the late bishop of London, Dr Mandell Creighton, who insisted over and over again on the claim of Cavendish to be recognized as the earliest of the great English biographers and an individual writer of particular charm and originality. He writes with simplicity and with a certain vivid picturesqueness, rarely yielding to the rhetorical impulses which governed the ordinary prose of his age. (E. G.)

Cawnpore (KHANPUR), a city and district of British India, in the Allahabad division of the North-West Provinces. The city is situated on the right bank of the Ganges, 417 feet above the sea; 684 miles by rail from Calcutta. In 1881 it had a population of 151,444; in 1891, of 188,712, showing an increase of nearly 25 per cent. In 1901 the population was 197,000, showing a further increase of 4 per cent. The municipal income in 1896-97 was Rs.3,61,899. In 1897 the death-rate was 49.59 per thousand. The municipality, with a population of 163,779, is governed by a board of 24 members, of whom 22 are elected. The waterworks provide an annual supply of about 480 million gallons of filtered water, being 8 gallons a head daily, at a total cost of four annas per thousand gallons. In 1897-98 the chief items of expenditure were: Rs.72,234 on water-supply, Rs.14,657 on drainage, and Rs.56,459 on other public works. The principal educational institutions are: the aided Christ Church College, with 36 students in 1896-97; the Government agricultural school for the province; industrial schools maintained by the S.P.G. and the American mission; and several high schools. There are 29 printing-presses, issuing 5 English and 5 vernacular newspapers. Besides Government manufactories of leather and flour, Cawnpore possesses 4 cotton-mills, having a total capital of Rs.59,00,000, with 1638 looms and 230,000 spindles, employing more than 6000 hands, producing 25,000,000 lb of yarn and woven goods valued at Rs.30,43,000; a woollen mill, having a capital of Rs.20,00,000, with 302 looms and 12,000 spindles, employing 1500 hands, producing all kinds of goods valued at Rs.15,35,000; a jute mill, having a capital of Rs.3,75,000, with 73 looms and 1574 spindles, employing 345 hands; two flour-mills, employing 132 hands, with an out-turn valued at Rs.9,70,000; four large tanneries and leather factories; a small iron-foundry; and factories of ice and mineral waters. Cawnpore is also a great railway centre, where the lines of the East Indian, the Oudh and Rohilkhand, the Indian Midland, and the Rajputana railways all meet. Since 1875 the Ganges has been crossed by an iron girder bridge of 25 spans, superseding the former bridge of boats. The cantonments, to the east of the native quarter, contain accommodation for a battery of artillery, a European and native infantry regiment, and a native cavalry regiment.

The district of CAWNPORE has an area of 2363 square miles. It had a population in 1881 of 1,181,396, and in 1891 of 1,209,695, showing an increase of 2 per cent., and an average density of 512 persons per square mile. In 1901 the population was 1,259,243, showing a further increase of 4 per cent. The land revenue and rates were Rs.24,47,361, the incidence of assessment being R.1:6:7 per acre; the cultivated area in 1896-97 was 737,218 acres, of which 241,883 were irrigated; the number of police was 3606; the number of vernacular schools in 1896-97 was 140, with 6435 pupils; the registered death-rate in 1897 was 41.15 per thousand. The district is watered by four branches of the Ganges canal, and traversed by two lines of railway. There are 98 indigo factories, employing 5000 persons, with an out-turn valued at Rs.8,84,000, and sugar-works with an out-turn valued at Rs.3,00,000.

Cayley, Arthur (1821-1895), English mathematician, born at Richmond in Surrey, 16th August 1821, was the second son of Henry Cayley, a Russian merchant, and Maria Antonia Doughty. Mr Henry Cayley retired from business in 1829 and settled in Blackheath, where Arthur was sent to a private school kept by the Rev. G. B. F. Potticary; at the age of fourteen he was transferred to King's College School, London. He soon showed that he was a boy of great capacity, and in particular that he was possessed of remarkable mathematical ability. On the advice of the school authorities he was entered at Trinity College, Cambridge, as a pensioner. He was there coached by William Hopkins of Peterhouse, was admitted a scholar of the college in May 1840, and graduated as Senior Wrangler in 1842, and obtained the first Smith's Prize at the next examination. In 1842, also, he was elected a Fellow of Trinity, and became a Major Fellow in 1845, the year in which he proceeded to the M.A. degree. He was assistant tutor of Trinity for three years. In 1846, having decided to adopt the law as a profession, he left Cambridge, entered at Lincoln's Inn, and became a pupil of the conveyancer Mr Christie. He was called to the Bar in 1849, and remained at the Bar fourteen years, till 1863, when he was elected to the new Sadlerian Chair of Pure Mathematics in the University of Cambridge. He settled at Cambridge in the same year, and married Susan, daughter of Robert Moline of Greenwich. He continued to reside in Cambridge and to hold the professorship till he died, 26th January 1895. From the time he went first to Cambridge till his death he was constantly engaged in mathematical investigation. The number of his papers and memoirs, some of them of considerable length, exceeds 800; they were published, at the time they were composed, in various scientific journals in Europe and America, and are now embodied, through the enterprise of the syndics of the Cambridge University Press, in thirteen large quarto volumes. These form an enduring monument to his fame. He wrote upon nearly every subject of Pure Mathematics, and also upon Theoretical Dynamics and Spherical and Physical Astronomy. He was quite as much a geometrician as he was an analyst. Among his most remarkable works may be mentioned his ten *Memoirs on Quantics*, commenced in 1854 and completed in 1878; his creation of the *Theory of Matrices*; his researches on the *Theory of Groups*; his *Memoir on Abstract Geometry*, a subject which he created; his introduction into geometry of the "Absolute"; his researches on the higher singularities of curves and surfaces; the classification of cubic curves; additions to the *Theories of Rational Transformation and Correspondence*; the theory of the twenty-seven lines that lie on a cubic surface; the theory of elliptic functions; the attraction of ellipsoids; the *British Association Reports*, 1857 and 1862, on recent progress in general and special theoretical dynamics and on the secular acceleration of the moon's mean motion. He is justly regarded as one of the greatest of mathematicians. Competent judges have compared him to Euler for his range, analytical power, and introduction of new and fertile theories. He was the recipient of nearly every academic distinction that can be conferred upon an eminent man of science. Amongst others may be noted honorary degrees by the universities of Oxford, Dublin, Edinburgh, Göttingen, Heidelberg, Leyden, and Bologna. He was Fellow or foreign corresponding member of the French Institute, the Academies of Berlin, Göttingen, St Petersburg, Milan, Rome, Leyden, Upsala, and Hungary; and he was nominated an officer of the Legion of Honour by President Carnot. At various times he was President of the Cambridge Philosophical Society, of the London Mathematical Society, and of the Royal Astronomical

Society. He was elected a Fellow of the Royal Society in 1852, and received from that body a Royal Medal in 1859 and the Copley Medal in 1882. He also received the De Morgan Medal from the London Mathematical Society, and the Huyghens Medal from Leyden. His nature was noble and generous, and the universal appreciation of this fact gave him great influence in his university. His portrait, by Lowes Dickinson, was placed in the hall of Trinity College in 1874, and his bust, by Henry Wiles, in the library of the same college in 1888. (P. A. M.)

Ceará, an Atlantic state of Brazil, situated between 2° 45' and 7° 11' S. lat., and 36° 45' and 41° 15' W. long. Its area is 40,253 square miles. The population in 1872 was 721,086, and in 1890 was 805,687. The capital, Fortaleza, has 48,000 inhabitants. Amongst the other towns are Aracaty (18,000 inhabitants), Barbalha, Cascavel, Crato, Granja, Icó, Igatú, Quixeramobim, Sant' Anna, Quixadá, and San Bernardo das Russas. There are railways from the port of Camocim to Sobral (80 miles), and from Fortaleza to Quixeramobim-Quixadá (117 miles).

Cebu, capital of the island of Cebu, Philippine Islands, beautifully situated on its eastern coast, a little north of the centre. Its port, formed by the islands of Mactan and Opon, is well protected from violent winds. The streets are wide and regularly laid out. The Government buildings are fair, and the church buildings very fine. It is an episcopal see, and the palace of the bishop, although small, is noted for its interior decorations. The Augustinian church is famous for its so-called miraculous image of Santo Niño. The Recoleta monastery and the seminary of San Carlos are worthy of mention. The cathedral was finished towards the end of the 18th century. There is a leper hospital in the outskirts of the town. Historically, Cebu is famous as the scene of Magellan's landing in 1521. A cross, said to be the identical one first erected by him, is still preserved in the cathedral. The great explorer lost his life in the neighbouring island of Mactan. The first Spanish settlement in the Philippines was established at Cebu in 1565, and from that year to 1571 it was the capital of the colony. Commercially, it is the third city of the Philippines. Its trade amounts to some \$3,000,000 (gold) annually. Hemp and sugar are the most important exports. Salt, pottery, and fabrics of silk, sinamay, hemp, and cotton are manufactured, and sugar sacks are woven in considerable quantity. In addition to the trade with foreign ports, an important domestic commerce is carried on with Manila, Bohol, Negros, and northern Mindanao. The language is Cebu-Visayan. Population, 24,000.

Cedar Creek, a small branch of the North Fork of Shenandoah river, in a valley of Virginia, U.S.A. It is known in American history as the scene of a memorable battle, which took place on 9th October 1864, between the Union army under Sheridan and the Confederates under Early. The Confederates attacked at daybreak, effecting a surprise, and driving back the Union forces in confusion. Sheridan was at this time on his way back to his army from an absence in Washington, and reached the field in the midst of the rout. By his presence he stopped the retreat, the advancing Confederates were checked, and then, taking the offensive, the Union troops drove the Confederates from the field, gaining a complete victory. The losses on both sides were heavy. Those on the Federal side were 6000 in killed and wounded, and the Confederates admitted a loss of 3100.

Cedar Falls, a city of Blackhawk county, Iowa,

U.S.A., on the Red Cedar river. Population (1890), 3459; (1900), 5319, of whom 863 were foreign-born.

Cedar Rapids, a city of Linn county, Iowa, U.S.A., situated in 41° 58' N. lat. and 91° 31' W. long., on Cedar river, in the eastern part of the state, at an altitude of 732 feet. It is the headquarters of the Burlington, Cedar Rapids, and Northern railway, with its works, and is entered also by the Illinois Central, the Chicago and North-Western, and the Chicago, Milwaukee, and St Paul railways, which make it an important transportation centre. The city has a fine water-power in Cedar river, and its manufactures are extensive and varied. Coe College, a Presbyterian institution, was founded in 1881. In 1898 it had a faculty numbering ten, and was attended by 106 students, more than half of whom were women. Population (1880), 10,104; (1890), 18,020; (1900), 25,656, of whom 4478 were foreign-born and 230 were negroes.

Cefalu, a seaport town and bishop's see of Sicily, Italy, in the province of Palermo, on a promontory on the N. coast, 42 miles by rail E. by S. of Palermo on the line to Messina. A bronze statue was erected here in 1894 to the Sicilian patriot Niccolò Botta. The people carry on sardine-fishing, and there is some trade. Population, about 16,000.

Ceglie, a town of the province of Lecce, Apulia, Italy, 23 miles W. from Brindisi. It produces olive oil, lime, and building stone. Population, about 14,000.

Cehegin, a town of Spain, in the province of Murcia, with a population in 1897 of 11,365. It is situated on the right bank of the river Quipar. On the height styled Cabecico de Roenas stood the Roman town of Begastri, from the ruins of which the inhabitants for centuries obtained the stone for their principal church, the house of Yañez Espin, and the convent of San Francisco, on whose walls can be seen the Roman inscriptions and designs. Spanish antiquaries believe the name Cehegin came from the Berber invaders of the 10th century, Zinhagies or Sinhachie.

Celænæ, in ancient geography an important city of Phrygia, situated on the great trade route to the East. Its acropolis was considered by Alexander to be impregnable. Beneath it were the palace of Xerxes and the Agora, in or near which was the cavern whence the Marsyas, one of the sources of the Mæander, issued. According to Xenophon, Cyrus had a palace and large park full of wild animals at Celænæ. The town was deserted when Apamea was founded.

Celebes, one of the four great Sunda Isles in the Dutch East Indies. Area, including the neighbouring islands (Sangir, Talaut, Saleyer, Buton, &c.), 77,865 square miles. The eastern part of the northern peninsula, Minahassa, consisting of volcanic rock with conglomerates and tufas, is separated by the Mongondo chain from the granitic diorite and gneiss of the western part (Boni chain), and the old eruptive rocks and slate of the Matinang and Oleida chains between Bwool and the Gulf of Tomini. The same (crystalline) slate occurs in Central Celebes, near Lake Posso, but, except in Minahassa, no volcanoes are found. The older sedimentary and eruptive rocks are surrounded by Tertiary and Quaternary alluvium, clay, and coralline limestone, but Mesozoic formations are wanting. The south-western peninsula has a volcano, the Peak of Bonthain. P. and F. Sarasin are of the opinion that the northern and southern peninsulas originally formed separate islands which were united to Central Celebes about the end of the Mesozoic period. The variations in surface relief are in conformity

with the geological structure. Minahassa consists of a plateau divided into smaller sections by volcanoes (highest Klabat, 6620 feet). In the west of the northern peninsula the interior consists in part of plateaux of considerable extent enclosed by the coast ranges. Near Lake Posso the mountains are higher; the Tampiko massif has a height of nearly 5000 feet, the chains south and west of the lake have a general altitude of about 5450 feet, with peaks still loftier. In the southern peninsula two chains stretch parallel with the west and east coasts; the former is the higher, with a general altitude of 3200 feet. In the south it joins the Peak of Bonthain, a volcanic mass as colossal as Etna, 10,088 feet high. An alluvial coast plain, 7 to 9 miles wide, stretches along the foot of the western chain, and between the two chains is the basin of the Walannaë, flowing northwards into Lake Sidenreng. The orography of the eastern peninsula is still unexplored.

The rivers of the narrow mountainous peninsulas form many rapids and cataracts; as the Tondino, draining the lake of the same name to Menado; the Rano i-Apo, flowing over the plateau of Mongondo to the Gulf of Amurang; the Poigar, issuing from a still unknown lake of that plateau; the Lombagin, traversing narrow cañons; and the river of Boni, which has its outfall in the plain of Gorontalo, near the mouth of the Bolango or Tapa, the latter connected by a canal with the Lake of Limbotto. All these rivers are navigable by praus or rafts for only a few miles above the mouth. In Central Celebes, the Kodina flows into Lake Posso, and the Kalaëna discharges to the Gulf of Boni; the Posso, navigable by *blottos* (canoes formed of hollowed tree-trunks), is the only river flowing from the lake to the Gulf of Tomini. The rivers of the southern peninsula, owing to the relief of the surface, are navigable to a somewhat greater extent. The Walannaë flows into Lake Tempe, and, continued by the Jenrana (Tienrana), which discharges into the Gulf of Boni, is navigable for little boats; the Sadang, with many affluents, flows to the west coast, and is navigable by *sampans*. The Jenemaja (Djenemadja) is a broad river, navigable far from the mouth (Weber and Wichmann).

The coasts of Celebes consist of alluvium and of Tertiary strata (except where older rocks reach the coast); they are often fertile and well populated; but, as shown by the marine charts, many sand, mud, and stone banks lie near the shore, and consequently there are few accessible or natural ports or good roadsteads.

The climate of the island, everywhere accessible to the influence of the sea, is maritime-tropical, the temperature ranging generally between 77° and 80° F., the extremes being about 90° and 70° F., only on the higher mountains falling during the night to 54° or 55° F. The rainfall in the northern peninsula (north of the equator) differs from that of the southern; the former has rains (not caused by the monsoon), and of smaller amount, 102 inches annually; the latter has a greater rainfall, 157 inches, brought by the north-western monsoon, and of which the west coast receives a much larger share than the east. In natural vegetation and fauna, as well as in cultivated products, Celebes presents the transitional link between the Asiatic and the Australian regions of the Malayan province. For example, rice is produced here in smaller quantity and of inferior quality to that in the western part of the archipelago, but superior to that in the eastern section, where sago and miloe form the staple articles of food. The products of the forests, which differ in like manner, amount to from £80,000 to over £160,000 annually, supplying about half the total exports. Coffee in Minahassa yielded 9000 piculs in 1897. The fisheries include trepang, turtle, and pearl oysters. Gold is worked under European direction in the district of Gorontalo, but with only partial success; the search for coal in the southern peninsula has yielded no satisfactory results; tin, iron, and copper, found in the eastern peninsula and elsewhere, are utilized only for native industries.

Celebes is divided, for administrative purposes, into the Residency of Menado and the Government of Celebes with dependencies. The eastern peninsulas belong politically to the Residency of Ternate.

The *Residency of Menado* comprises three districts: Minahassa, the little states along the north coast west of Minahassa, and Gorontalo, including the other states of the northern peninsula lying along the Gulf of Tomini. Total area, 22,147 square miles. The following table shows the distribution and composition of the population:—

Districts.	Europeans.	Chinese.	Arabs.	Other Oriental Foreigners.	Natives.	Total.
Minahassa	836	3574	286	16	296,617	301,329
Gorontalo	115	505	133	...	247,056	247,809

The density of population being calculated at about 2·7 to 3 per square mile for Celebes, is 16·2 for Minahassa, but only 1·5 to 2 for the Residency of Menado. Centres of population in Menado are Amurang (3000), the seat of a controller, and a calling place for the steamers of the Indian Packet Company; Menado (10,000), the chief town of the residency, the principal station of the Dutch missionaries, with a fair amount of trade (200,000 tons), but an unsafe roadstead; Tondano (12,000; 10,000 Christians), near the lake and river of the same name, at an altitude of nearly 2000 feet, and one of the chief centres; Gorontalo, one of the most important towns of Celebes, carrying on direct trade with Singapore and Europe. All the other coast places have some importance as chief villages of the little states and as ports of call for the vessels of the steam packet company, but have only from 500 to 1000 inhabitants.

The *Government of Celebes and Dependencies* is subdivided into the government territory, the vassal states (Boni and Ternate), and the federal countries. The following figures show the number and composition of the population:—

	Europeans.	Chinese.	Arabs.	Other Oriental Foreigners.	Natives.	Total.
Government of Celebes and Dependencies	1414	3738	554	54	1,442,962	1,448,722

The density of population for the whole government is estimated at 3·7, or 4 per square mile, varying from 2·2 in the vassal and federated states to 14·7 to 18·4 for Macassar and the districts directly governed by the Dutch. The density of population in districts outside the influence of European government sinks to 1 and less per square mile. As in the case of Minahassa, the difference must be explained by physical and moral conditions. Two-thirds of the natives live by agriculture, and one-third by trade, navigation, shipbuilding, and other industries. The difference in occupation, as compared with Menado, is shown in the following table:—

	Traders.	Fishermen and Sailors.	Salt Workers.	Ship-builders.	Goldsmiths and silversmiths.	Armourers.	Dyers in blue.	Other Trades.
Government of Celebes and Dependencies	6753	13,419	604	248	653	138	226	6375
Minahassa	225	1,431	27	..	42	149
Gorontalo	1055	1,583	107	..	37	29	86	1532

In agreement with the three principal occupations, the centres of population are found in southern Celebes, on the coast (not in the interior plains or on the lake, as in Menado). Palos (3000), with good port; Pare-Pare, connected by road with Lake Tempe; and Macassar, the seat of the governor and the centre of trade for the eastern part of the archipelago. Declared a free port in 1832, the value of the trade of Macassar increased from £125,000 in that year to £1,250,000 in 1895. Of the 17,925 inhabitants, Europeans numbered 940, Chinese 2618, and Arabs

168. On the south coast must also be named Bonthain (4000); on the east coast, Balong-Nipa; and Buton and Saleyer, seats of administration and ports of call for the packet company's steamers, on the island groups of the same names.

(C. M. K.)

Celle, a town of Prussia, province of Hanover, 27 miles by rail N.E. of Hanover, the former capital (14th century to 1705) of the dukes of Brunswick-Lüneburg. The ducal castle, begun in 1485, but dating in part from the 18th century, still stands. The parish church contains the tombs of the dukes, also of Sophia Dorothea, the divorced wife of George I. (of England). The law courts, with a good library, the national museum, and the hall of the estates, are the remaining buildings of note. There are manufactures of woollen yarn, tobacco, umbrellas, printers' ink, &c., and a lively trade is conducted in wool, timber, honey, and wax. Gardening is also carried on. Population (1885), 18,782; (1900), 19,884.

Cellier, Alfred (1844-1891), English musical composer, was born at Hackney in 1844. As a boy he was a chorister at the Chapel Royal, St James's, under the Rev. Thomas Helmore, where Arthur Sullivan was one of his youthful colleagues. His first appointment was that of organist at All Saints' Church, Blackheath (1862). In 1866 he succeeded Dr Chipp as director of the Ulster Hall concerts, Belfast, at the same time acting as conductor of the Belfast Philharmonic Society. In 1868 he returned to London as organist of St Alban's, Holborn. From 1871 to 1875 he was conductor at the Prince's Theatre, Manchester; and from 1877 to 1879 at various London theatres. During this period he composed many comic operas and operettas, of which the most successful was *The Sultan of Mocha*, which was produced at Manchester in 1874, in London at the St James's Theatre in 1876, and revived at the Strand Theatre in 1887. In 1880 Cellier visited America, producing a musical version of Longfellow's *Masque of Pandora* at Boston (1881). In 1883 his setting of Gray's *Elegy* in the form of a cantata was produced at the Leeds Festival. In 1886 he won the great success of his life in *Dorothy*, a comic opera written to a libretto by B. C. Stephenson, which was produced at the Gaiety Theatre in September 1886, and, transferred first to the Prince of Wales's Theatre and subsequently to the Lyric Theatre, ran until April 1889. *Doris* (1889), and *The Mountebanks*, which was produced in January 1892, a few days after the composer's death, were less successful. Cellier owed much to the influence of Sullivan. He had little of the latter's humour and vivacity, but he was a fertile melodist, and his writing is invariably distinguished by elegance and refinement. He died in London in 1891. (R. A. S.)

Cement.—Any material capable of adhering to and uniting into a coherent mass fragments of a substance not in itself adhesive, is a cement. Glue, gum, paste, putty, mortar, and Portland cement are familiar examples of

materials of this class. In practice, however, the term "cement" used without qualification means Portland cement, its modifications and congeners: these are all hydraulic cements, *i.e.*, when set they resist the action of water, and can, under favourable conditions, be allowed to set under water. It was well known to builders in the earliest historic times that certain limes would, when set, resist the action of water, *i.e.*, were hydraulic; it was also known that this property could be conferred on ordinary lime by admixture of silicious materials such as puzzuolana or tufa. We have here the two classes into which hydraulic cements are divided.

When pure chalk or limestone is "burned," *i.e.*, heated in a kiln until its carbonic acid has been driven off, it yields pure lime. This slakes violently with water, giving slaked lime, which can be made into a smooth paste with water and mixed with sand to form common mortar. The setting of the mortar is due to the drying of the lime (a purely physical phenomenon), no chemical action occurring between the lime and the sand. The function of the sand is simply that of a diluent to prevent undue shrinkage and cracking in drying. Subsequent hardening of the mortar is caused by the gradual absorption of carbonic acid from the air by the lime, a skin of carbonate of lime being formed; but the action is superficial. Mortar made from pure or "fat" lime cannot withstand the action of water, and is only used for work done above water-level. If, however, such "fat" lime is mixed in the presence of water, not with sand but with silica in an active form, *i.e.*, amorphous and (generally) hydrated, or with a natural silicate containing silica in an active condition, it will unite with the silica and form a silicate of lime capable of resisting the action of water. The mixture of the lime and active silica or silicate is a puzzuolanic cement. The simplest of all puzzuolanic cements would be a mixture of pure lime and hydrated silica, but though the latter is prepared artificially for various purposes, it is too expensive to be used as a cement material. A similar obstacle lies in the way of using a certain native form of active silica, *viz.*, Kieselguhr, for it is too valuable as an absorbent of nitroglycerine, for the manufacture of dynamite, to be available for making puzzuolanic cement. There are, however, many silicious substances occurring abundantly in nature which can thus be used. They are mostly of volcanic origin, and include pumice, tufa, santorin earth, trass, and puzzuolana itself. The following analyses show their general composition:—

	Neapolitan Puzzuo- lana (per cent.).	Roman Puzzuo- lana (per cent.).	Trass (per cent.).
Soluble silica (SiO ₂)	27.80	32.64	19.32
Insoluble silicious residue	35.88	25.94	50.40
Alumina (Al ₂ O ₃)	19.80	22.74	13.86
Ferric oxide (Fe ₂ O ₃)	5.68	4.06	3.10
Lime (CaO)	0.35	1.37	0.13
Magnesia (MgO)	Trace	Trace	7.57
Sulphuric anhydride (SO ₃)	4.27	8.92	5.04
Combined water (H ₂ O)	6.72	4.33	0.58
Carbonic anhydride (CO ₂)			
Moisture			
Alkalies and loss	100.00	100.00	100.00

An artificial product which serves perfectly as a puzzuolana is granulated blast-furnace slag. The slag, which must contain a high percentage of lime, is granulated by being run while fused into abundance of water. This granulated slag differs from the same slag allowed to cool slowly, in that a portion of the energy which it possesses while fused is retained after it has solidified. It bears to ordinary slowly-cooled slag a similar relation to that borne by plastic sulphur to ordinary crystalline sulphur. This potential energy becomes kinetic when the slag is brought

into contact with lime in the presence of water, and causes the formation of a true hydraulic silicate of lime. The following analysis shows the composition of a typical slag:—

	Per cent.
Insoluble residua	1·04
Silica (SiO ₂)	31·50
Alumina (Al ₂ O ₃)	18·56
Manganous oxide (MnO)	0·44
Lime (CaO)	42·22
Magnesia (MgO)	3·18
Soda (Na ₂ O)	0·70
Sulphuric anhydride (SO ₃)	0·45
Sulphur (S)	2·21
	<hr/>
	100·30
Deduct oxygen equivalent to sulphur	1·10
	<hr/>
	99·20

Granulated slag of this character is ground with slaked lime until both materials are in a state of fine division and intimately mixed. The usual proportions are three of slag to one of slaked lime by weight. The product termed slag cement sets slowly, but ultimately attains a strength scarcely inferior to that of Portland cement. Puzzuolanic cements are little used in England. Generally speaking they are only of local importance, their cheapness depending largely on the nearness and abundance of some suitable volcanic deposit of the trass or tufa class. They are not usually manufactured by the careful grinding together of the puzzuolana and the lime, but are mixed roughly, a great excess of puzzuolana being employed. This excess does no harm, for that part which fails to unite with the lime serves as a diluent, much as does sand in mortar. In fact, ordinary puzzuolanic cement made on the spot where it is to be used may be regarded as a better kind of common mortar having hydraulic qualities. Good hydraulic mortars may be made from lime mixed with furnace ashes or burnt clay as the puzzuolanic constituent.

Cements of the Portland type differ in kind from those of lime and active silica ready to unite under suitable conditions, but consist of definite chemical compounds of lime and silica and lime and alumina, which, when mixed with water, combine therewith, forming crystalline substances of great mechanical strength, and capable of adhering firmly to clean inert material, such as stone and sand. They are made by heating to a high temperature an intimate mixture of a

calcareous substance and an argillaceous substance. The commonest of such substances in England are chalk and clay, but where local conditions demand it, limestone, marl, shale or any similar material may be used, provided the correct proportions of calcium carbonate, silica, and alumina are maintained. The earliest forms of cements of the Portland class were the hydraulic limes. These are still largely used, and are prepared by burning limestones containing clayey matter. Some of these naturally possess a composition differing but little from that of the mixture of raw materials artificially prepared for the manufacture of Portland cement itself. Although hydraulic limes have been in use from the most ancient times, their true nature and the reason of their resistance to water have been known for less than 100 years. Next in antiquity to hydraulic lime is Roman cement, prepared by heating an indurated marl occurring naturally in nodules. Its name must not be taken to imply that it was used by the ancients; in point of fact the manufacture of this substance dates back only about 100 years.

With the growth of engineering in the early part of the 19th century arose a great demand for hydraulic cement. The supply of materials containing naturally suitable proportions of calcium carbonate and clay being limited, attempts were made to produce artificial mixtures which would serve a similar end. Among those who experimented in this direction was Joseph Aspdin, of Leeds, who added clay to finely-ground limestone, calcined the mixture, and ground the product, which he called Portland cement. The only connexion between Portland cement and the place Portland is that the cement when set somewhat resembles Portland stone in colour. True, it is possible to manufacture Portland cement from Portland stone (after adding a suitable quantity of clay), but this is merely because Portland stone is substantially carbonate of lime; any other limestone would serve equally well. Although Portland cement is later in date than either Roman cement or hydraulic lime, yet on account of its greater industrial importance, and of the fact that, being an artificial product, it is of approximately uniform composition and properties, it may conveniently be treated of first. The greater part of the Portland cement made in England is manufactured on the Thames and Medway. The materials are chalk and Medway mud; in a few works the latter is replaced by gault.

The composition of typical samples of chalk and clay is shown in the following analyses:—

CHALK.		CLAY.			
	Per cent.		Per cent.		
Silica (SiO ₂)	0·92	Insoluble silicious matter	26·67	Consisting of	
Alumina + ferric oxide (Al ₂ O ₃ + Fe ₂ O ₃)	0·24	Silica (SiO ₂)	31·24	Quartz (SiO ₂)	19·33
Lime (CaO)	55·00	Alumina (Al ₂ O ₃)	16·60	Silica (SiO ₂)	5·19
Magnesia (MgO)	0·36	Ferric oxide (Fe ₂ O ₃)	8·66	Alumina (Al ₂ O ₃)	1·47
Carbonic anhydride (CO ₂)	43·40	Lime (CaO)	0·25	Magnesia (MgO)	0·03
		Magnesia (MgO)	1·91	Soda (Na ₂ O)	0·65
		Soda (Na ₂ O)	1·00	} Felspar 7·34 per cent.	
		Potash (K ₂ O)	0·45		
		Sodium chloride (NaCl)	1·86		
		Combined water, organic matter, and loss	11·36		
	99·92		100·00		26·67

These materials are mixed in the proportion of about 3 : 1 by weight so that the dried mixture contains approximately 75 per cent. of calcium carbonate, the balance being clay. The mixing may be effected in several ways. The method once exclusively used consists in mixing the raw materials with a large quantity of water in a wash mill, a machine having radial horizontal arms

driven from a central vertical spindle and carrying harrows which stir up and intermix any soft material placed in the pit in which the apparatus revolves. The raw materials in the correct proportion are fed into this mill together with a large quantity of water. The thin watery "slip" or slurry flows into large settling tanks ("backs") where the solids in suspension are deposited; the water is drawn off,

leaving behind an intimate mixture of chalk and clay in the form of a wet paste. This is dug out, and after being dried on floors heated by flues is ready for burning. This process is now almost obsolete. According to present practice the raw materials are mixed in a wash mill with so much water that the resulting slurry contains 40 to 50 per cent. of water. The slurry, which is wet enough to flow, is ground between millstones so as to complete the process of comminution begun in the wash mill. Thorough grinding and mixing are of the utmost importance, as otherwise the cement ultimately produced will be unsound and of inferior quality. The drying of the slurry is generally effected by the waste heat of the kilns, so that while one charge is burning another is drying ready for the next loading of the kilns. The kilns most commonly employed nowadays are "chamber kilns," circular structures

Loading the kiln.

not unlike an ordinary running lime kiln, but having the top closed and connected at the side with a wide flue in which the slurry is exposed to the hot products of combustion from the kiln. The farther ends of the flues of several such kilns are connected with a chimney shaft. The slurry, in drying on the floor of the flue, forms a fairly tough cake which cracks spontaneously in the process of drying into rough blocks suitable for loading into the kiln. At the bottom of the kiln is a grate of iron bars, and on this wood and coke are piled to start the fire. A layer of dried slurry is loaded on this, then a layer of coke, then a layer of slurry, and so on until the kiln is filled with coke and slurry evenly distributed. Fresh slurry is run on to the drying floors, and the kiln is started. The construction of an ordinary chamber kiln may be gathered from the accompanying diagram (Fig. 1).

Fig. 1.

The operation of burning is a slow one. An ordinary kiln, which will contain about 50 tons of slurry and 12 tons of coke, will take two days to get fairly alight, and will be another two or three days in burning out. Therefore, allowing adequate time for loading and unloading, each kiln will require about one week for a complete run. The output will be about 30 tons of "clinker" ready to be ground into cement. The grinding of the hard rock-like masses of clinker is effected between millstones, or in modern plants in ball-mills, tube-mills, and edge-runners. It is an important part of the manufacture, because the finished cement should be as fine and "floury" as possible. The foregoing description represents the procedure in use in many English factories. There are various modifications in practice according to local conditions: a few of these may be described. In all cases, however, the main operations are the same, viz., intimately mixing the raw materials, drying the mixture, if necessary, and burning it at a clinkering temperature (about $1500^{\circ}\text{C.} = 2732^{\circ}\text{Fahr.}$). Thus when hard limestone is the form of calcium carbonate locally available, it is ground dry and mixed with the

correct proportion of clay also dried and ground. The mixture is slightly damped, moulded into rough bricks, dried and burned. A possible alternative is to burn the limestone first and mix the resulting lime with clay, the mixture being burned as before. By this method grinding the hard limestone is avoided, but there is an extra expenditure of fuel in the double burning.

Many different forms of kiln are used for burning Portland cement. Besides the chamber kilns which have been described, there are the old-fashioned bottle kilns, which are similar to the chamber kilns, but are bottle-shaped and open at the top; they do not dry the slurry for their next charge. Their use is becoming obsolete. There are also stage kilns of the Dietsch type, which consist of two vertical shafts, one above the other, but not in the same vertical line, connected by a horizontal channel. At this middle portion and in the upper part of the lower shaft the burning proper proceeds; the upper shaft is full of unburnt raw material which is heated by the hot gases coming from the burning zone, and the lower shaft contains clinker already burned and hot enough to heat the incoming air which supplies that necessary for combustion at the clinkering zone. A pair of Dietsch kilns, built back to back, are shown in Fig. 2. Another form is the

Other kilns.

Fig. 2.

Hoffmann or ring kiln, made up of a number of compartments arranged in a ring and connected with a central chimney; in these compartments rough brick-shaped masses of the raw materials are stacked, and between these bricks fuel is sprinkled. At a given moment one of these compartments is burning and at its full temperature; the air for combustion is drawn in through one or more compartments behind it which have just finished burning, and is thereby strongly heated; the products of combustion pass away through one or more compartments in front of it and heat their contents before they are subjected to actual combustion. It will be seen that the principle of the ring kiln is similar to that of the stage kiln. In each case the clinker which has just been burned and is fully hot serves to heat the air supply to the com-

partment where combustion is actually proceeding; in like manner the raw materials about to be burned are well heated by the waste gases from the compartment in full activity before they themselves are burned. (It may be noted that here and generally in this article "burn" is used in the technical sense; it is technically correct to speak of cement clinker being "burned," although it is not a fuel; in accurate terms it is the fuel which is burned, and it is the heat it generates which raises the clinker to a high temperature, *i.e.*, technically "burns" it.) By this device a great part of the heat is regenerated and a saving of fuel is effected.

A more modern method of burning cement is by means of rotatory kilns. These are largely used in the United States, and are being introduced into England and on the Continent. They consist of cylinders about 60 ft. long and 6 ft. in diameter placed at a slight angle with the horizontal, and carried on rollers so that they can be rotated by power. The cylinders are made of boiler plate and lined with refractory bricks. At the upper end the raw material is fed in either as a dry powder or as slurry; at the lower end is a powerful burner. Most of the kilns used in the United States employ petroleum as a fuel, but more recently powdered coal injected by a blast of air has been adopted. The rotation and slight inclination of the cylinder cause the raw material to descend towards the lower end. At the upper end the raw material is dried and heated moderately; as it descends it reaches a part of the kiln where the temperature is higher; here the carbonic acid of the carbonate of lime and the combined water of the clay are driven off, and the resulting lime begins to act chemically on the dehydrated clay. The material is then in a partially burnt and slightly sintered state, but is not fully clinkered and would not make Portland cement. As the kiln continues to revolve, the partly burnt material reaches the lower end of the kiln which is nearest the burner, and where the temperature is highest, and is there heated so highly that the union of the lime, silica, and alumina is complete, and fully burned clinker falls out of the kiln. It is extremely hot, and passes down one or more inclined rotating cylinders

rock-like substance of semi-vitrified appearance and very dark colour. The product from a well-run rotatory kiln is all evenly burnt and properly vitrified; that from an ordinary fixed kiln of whatever type is apt to contain a certain amount (5 to 15 per cent.) of underburnt material, which is yellowish and friable and is not properly clinkered. This material must be picked out, as such underburnt stuff contains free lime or unsaturated lime compounds. These may slake slowly in the finished cement and cause such expansion as may destroy the work of which it forms part. Well-burnt, well-picked clinker when ground yields good Portland cement. Nothing is added during or after grinding save a small amount (1 to 2 per cent.) of calcium sulphate in the form either of gypsum or of plaster of Paris, which is sometimes needed to make the cement slower-setting. This small addition for this specified purpose is recognized as legitimate, but the employment of various cheap materials such as rag-stone and blast-furnace slag, sometimes added as diluents or make-weights, is adulteration and therefore fraudulent.

The composition of Portland cement varies within comparatively narrow limits, and the variations are tending to become smaller as regularity and skill in manufacture increase. The following analysis may be taken as typical of cements made from chalk and clay on the Thames and Medway:—

	Per cent.
Silica (SiO ₂)	22.0
Insoluble residue	1.0
Alumina (Al ₂ O ₃)	7.5
Ferric oxide (Fe ₂ O ₃)	3.5
Lime (CaO)	62.0
Magnesia (MgO)	1.0
Sulphuric anhydride (SO ₃)	1.5
Carbonic anhydride (CO ₂)	0.5
Water (H ₂ O)	0.5
Alkalies	0.5
	100.0

There may be minor variations from this composition. Thus the silica may range from 20 per cent. to 24 per cent., the alumina and ferric oxide jointly from 9 per cent. to 13 per cent., the lime from 60 per cent. to 65 per cent.

Other things being equal, the higher the percentage of lime within the limits indicated above the stronger is the cement, but such highly limed cement is less easy to burn than cement containing about 62 per cent. of lime; and unless the burning is thorough and the raw materials are intimately mixed, the cement is apt to be unsound. Although the ultimate composition of cement, that is, the percentage of each base and acid present, can be accurately determined by analysis, its proximate composition, *i.e.*, the nature and amount of

the compounds formed from these acids and bases, can only be ascertained indirectly and with difficulty. The best and most recent investigation on this subject has been made by M. H. le Chatelier, whose work has since been supplemented by that of Messrs Spenser B. Newberry and W. B. Newberry. According to Le Chatelier, the chief constituent of Portland cement is tri-calcium silicate, 3CaO SiO₂, a substance which when mixed with water combines with it according to the equation

The products of this reaction, hydrated mono-calcium silicate and calcium hydroxide, crystallize and form a mass of interlocking crystals which constitutes the bulk of

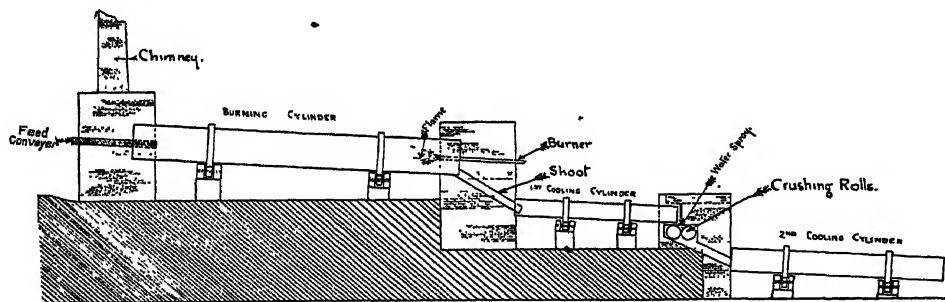

Fig. 3.

similar to the first, but acting as coolers instead of kilns. On its way down the cylinders the clinker meets a current of cold air and is cooled, the air being correspondingly warmed and passing on to aid in the combustion of the fuel used in heating the kiln. This regenerative heating is similar in principle and effect to that obtained by means of the Dietsch and ring kilns. The output of one of these kilns is about 200 tons per week, as against 30 tons for an ordinary chamber kiln. A large saving in labour is also secured. The system presents many advantages, and is likely to replace the older methods of cement making. Fig. 3 represents diagrammatically a rotatory cement plant on the Hurry and Seaman system.

Portland cement clinker, however produced, is a hard,

set cement. The other chief constituent of Portland cement is a calcium aluminate. According to Le Chatelier, this body is a tri-calcium aluminate and sets when mixed with water and lime derived from other constituents of the cement, such as unstable ferrites, or from the decomposition of the tri-calcium silicate mentioned above, according to the equation

According to Messrs Newberry, however, the aluminate is di-calcium aluminate, $2 \text{CaO Al}_2\text{O}_3$; the mode of hydration and setting of this body has not been studied. Although the precise composition of the aluminate is still a matter for discussion, it is generally admitted that it is the chief agent in the first setting of the cement. The ultimate hardening and the attainment of strength are due to the tri-calcium silicate. The function of the ferric oxide present in ordinary cement is little more than that of a flux to aid the union of the silica, alumina, and lime in the clinker; its rôle in the setting of the cement is altogether secondary. Magnesia is present in most Portland cements in quantities varying from 1 to 5 per cent. Within this range it appears to be inert, forming no cementitious compound. There is evidence that in larger proportion, *e.g.*, 10 to 15 per cent., it may hydrate and set after the general setting of the cement, and may give rise to disruptive strains and cause the cement to "blow" and fail. In so-called natural cement (p. 633) which is comparatively lightly burnt, the magnesia appears to be inert, and as much as 20 to 30 per cent. may be present. Another constituent of Portland cement which influences its setting time is calcium sulphate, naturally formed from the sulphur in the raw materials or fuel, or intentionally added to the finished cement as gypsum or plaster of Paris. It has a remarkable retarding effect on the hydration of the calcium aluminate, and consequently on the setting of the cement; thus it is that a little gypsum is often added to convert a naturally quick-setting cement into one which sets slowly. It will be observed that in the hydration of tri-calcium silicate, the main constituent of Portland cement, a large portion of the lime appears as calcium hydroxide, *i.e.*, slaked lime. It is evident that this will form a puzzuolanic cement (p. 628) if a suitable silicious material such as trass is added to the cement. The ultimate product when set may be regarded as a mixed Portland and puzzuolanic cement. The use of trass in this manner as an adjunct to Portland cement has been advocated by Michaelis, but has not become general.

The quality of Portland cement is ascertained by its analysis and by determining its specific gravity, fineness, mechanical strength, and soundness. A good

Testing.

sample will have a composition within the limits cited above and approximating to the typical figures given on p. 631. It will be ground so finely that not more than 10 per cent. will be left on a sieve of 76×76 meshes per square inch, the wires of the sieve being 0.005 inch in diameter. It will have, when freshly burned, a specific gravity not lower than 3.15, and briquettes made from it and kept in water will possess a tensile strength of 400-500 lb per square inch seven days after they are made, while briquettes made from a mixture of 3 parts by weight of sand and 1 of cement will give about 200 lb per square inch at twenty-eight days. The soundness of the cement is ascertained by keeping thin pats of cement in water for seven and twenty-eight days at the ordinary temperature. The test is accelerated so that a valid opinion may be pronounced in a short time by keeping the water hot, *e.g.*, at 110° Fahr. or 176° Fahr. In this case an unsound cement may generally be detected in twenty-four hours. A pat of sound cement under these conditions remains free from cracks

and does not buckle. A cement slightly unsound will show numerous small cracks, while one which is markedly unsound may even go to pieces. A rigorous and exact test for soundness is that formulated by Deval, who has shown that briquettes of 3 of sand and 1 of cement kept in water for two days at $80^\circ \text{C.} = 176^\circ \text{Fahr.}$ attain approximately the same strength as similar briquettes attain at seven days in water at the ordinary temperature. In like manner briquettes kept at 176°Fahr. for seven days are equal in strength to those kept at the ordinary temperature for twenty-eight days. A cement not perfectly sound will give low results in the hot test, and a cement of indifferent soundness will crack and go to pieces. The test is admittedly severe, but can be passed without difficulty by cement made with proper care and skill. There are many modifications and elaborations of all the tests which have been mentioned. Cement for all important work is submitted to a rigorous system of testing and analysis before it is accepted and used.

Hydraulic Lime is a cement of the Portland as distinct from the puzzuolanic class. The most typical hydraulic lime is that known as Chaux du Theil, made from a limestone found at Ardèche in France. This limestone consists of calcium carbonate most intimately intermixed with very finely divided silica. It contains but little alumina and oxide of iron, which are the constituents generally necessary to bring about the union of silica and lime to form a cement, but in spite of this the silica is so finely divided and so well distributed that it unites readily with the lime when the limestone is burned at a sufficiently high temperature. English hydraulic limes are of a different class. They contain a good deal of alumina and ferric oxide, and in composition resemble somewhat irregular Portland cement. Analyses of the two classes of hydraulic lime are as follows:—

	Chaux de Theil. Per cent.	Blue Lias. Per cent.
Insoluble silicious matter	0.3	2.39
Silica (SiO_2)	21.7	14.17
Alumina (Al_2O_3)	1.8	6.79
Ferric oxide (Fe_2O_3)	0.6	2.34
Lime (CaO)	74.0	63.43
Magnesia (MgO)	0.7	1.54
Sulphuric anhydride (SO_3)	0.3	1.63
Carbonic anhydride (CO_2)	0.6	3.64
Water (H_2O)		2.69
Alkalies and loss	...	1.38
	100.0	100.0

Hydraulic lime contains a good deal of uncombined lime, and has to be slaked before it is used as a cement. In France this slaking is conducted systematically by the makers, the freshly burned lime being sprinkled with water and stored in large bins where slaking proceeds slowly and regularly until the whole of the surplus uncombined lime is slaked and rendered harmless, while the cementitious compounds, notably tri-calcium silicate, remain untouched. In English practice hydraulic lime is slaked by the user. Seeing that regular and perfect slaking is more easily attained when working systematically on a large scale and by storing the material for a long period, the French method is the better and more rational. The product may then be regarded as a cement of the Portland class mixed with slaked lime. When gauged with water and made into a mortar it sets slowly, but ultimately becomes almost as strong as Portland cement. Its slow setting is an advantage for some purposes, *e.g.*, for foundations and abutments where settlements may occur. The structure is free to take its permanent position before the lime sets, and cracks are thus avoided. A case in point is the employment of hydraulic lime in place of Portland cement as grouting outside the cast-iron tubes

used for lining tunnels made by the modern shield system.

Roman Cement is another cement of the Portland class which came into use some hundred years ago, shortly before the manufacture of artificial Portland cement was attempted. It is still in use, though only for special purposes where a quick-setting material is required. It is made from septaria nodules which are dredged up on the Kent and Essex coasts and consist of about 60 per cent of calcium carbonate mixed with clay, the mass being sufficiently indurated to remain coherent under water. The nodules are not prepared in any way, but simply burned at a moderate red heat. The resulting cement varies somewhat in composition, but approximates to the following figures:—

	Per cent.
Insoluble silicious matter	5·86
Silica (SiO_2)	19·62
Alumina (Al_2O_3)	10·30
Ferric oxide (Fe_2O_3)	7·44
Manganese dioxide (MnO_2)	1·57
Lime (CaO)	44·54
Magnesia (MgO)	2·92
Sulphuric anhydride (SO_3)	2·61
Carbonic anhydride (CO_2)	3·43
Water (H_2O)	0·25
Alkalies and loss	1·46
	100·00

The most characteristic constituent is the oxide of iron, which gives the cement a reddish colour, and the presence of manganese also differentiates Roman from Portland cement, which rarely contains appreciable quantities of that element. The high percentage of alumina causes the cement to be quick-setting, and it becomes hard in about five minutes. It resists the action of water, salt or fresh, very well, and is therefore useful in situations where the work is likely to be submerged immediately after it has been put in place.

The term *Natural Cements* is applied to cements made by burning mixtures of clay and carbonate of lime naturally occurring in approximately suitable proportions. They may be regarded as badly-mixed Portland cements, and need no special description. American "natural" cements are of a somewhat different class. They are usually made from a silicious limestone containing magnesia, and are comparatively lightly burned. The following analysis is typical of a cement of this kind:—

	Per cent.
Silica (SiO_2)	24·30
Alumina (Al_2O_3)	7·22
Ferric oxide (Fe_2O_3)	5·06
Lime (CaO)	33·70
Magnesia (MgO)	20·94
Water, carbonic anhydride, and loss	8·78
	100·00

These irregular cements of the Portland class are good building materials for ordinary purposes, but are not so suitable as good artificial Portland cement for heavy and important undertakings.

The chief use of hydraulic cements, whether of the puzzolanic or Portland class, is to act as an adhesive material in work which is to be exposed to water. No doubt in times of remote antiquity it was found that the jointing of masonry which was to be immersed required the use of a cement indifferent to the action of water. Ordinary mortar failed in such positions; mortar made from lime prepared from limestones or chalks containing a little clay was found to stand; mortar made from lime mixed with trass or similar active silicious material was also found to stand. On this observation rests the whole of

the present enormous employment of hydraulic cements. It was a natural transition to utilize these cements not merely for jointing masonry but also for making concrete, and the only reason why hydraulic cements, as distinct from cements which are not hydraulic (e.g., ordinary mortar), are used for the latter purpose is their great mechanical strength. Their use in above-water work is checked by the low price of common brick. Even in such work, where it would be thought that masses of burnt clay would be the cheapest conceivable material, concrete is at least on level terms with its rival. It must be remembered that one of the great advantages of concrete is that five-sixths of its total mass may be provided from local sand and gravel, on which no carriage has to be paid. The cement, on which alone freight is to be reckoned, converts these from loose incoherent material into a solid stone. Thus it comes about that the largest use of cement is for manufacturing concrete for dock and harbour work, and for the making of foundations. It is also employed for the building of light bridges, floors, and pipes constructed of cement mortar disposed round a skeleton of iron rods. Such composite structures take advantage at once of the high tensile strength of iron and of the high compressive strength of cement mortar.

Good hydraulic cements are highly permanent materials, provided certain conditions be observed. It might be supposed that hydraulic cements from their nature would be indifferent to the action of water, but this is only true if the structures of which they form part are sufficiently compact. In this case the action of the water is checked by the film of carbonate of lime which eventually forms on the surface of calcareous cement. This, together with the compactness of the mortar, hinders the ingress and egress of water, and prevents the dissolution and ultimate destruction of the cement. But where the concrete or mortar is not well made and is porous, the continual passage of water through it will gradually break up and dissolve away the calcareous constituents of the cement until its strength is utterly destroyed. This destructive action is increased if the water contains sulphates or magnesium salts, both of which act chemically on the calcareous constituents of the cement. As sea-water contains both sulphates and magnesium salts, it is especially necessary in concrete for harbour work to take every care to produce an impervious structure. There are various minor external causes for the failure and ultimate destruction of cement mortar and concrete, but their discussion is a matter for the specialist. Failure from inherent vice in the cement has been already touched on; it can always be traced to want of skill and care in manufacture.

Census—United Kingdom.—The historical account of the census in the United Kingdom has been already given in detail up to and including that of 1871. Since then the changes in procedure have not been numerous, though some are of considerable importance. In England and Wales the growth of population necessitated the increase of the enumerating agency from 32,543 in 1871 to 34,711 in 1881, to 35,507 in 1891, and to 38,200 in 1901, while the operations have been complicated by the greater number of local subdivisions to be recognized in the returns. Between 1871 and the next census, for instance, the creation of sanitary districts entailed

the compilation of population figures for 966 new areas. In the ensuing decade 44 of these were absorbed in their neighbours, 89 fresh ones were constituted, and 138 altered in boundaries. Three-fourths of the 14,600 civil parishes, again, were similarly modified, and changes of areas under the Local Government and Redistribution Acts added to the labour of tabulation. Material improvements were effected in the classification of occupations; and in 1891, upon the recommendation of the Treasury Committee appointed for the purpose, additional columns were included in the schedule in order to show separately the employers of labour, the employed, and the independent worker, an innovation which, however, failed, owing to inaccuracy of return, to fulfil anticipations. The subdivision of houses into separate occupancies was also prescribed, together with the return of the number of rooms, where less than five, occupied by each family. The Act regulating the census of 1901 further simplified the record by substituting the term *tenement* for *storey*, and providing for the separate record of houses altogether uninhabited as distinguished from those occupied only during the daytime. The record of nationality, again, was further extended at the 1901 census beyond the mere specification of the British subjects born abroad, and included that of all persons not born within the United Kingdom. In 1891 a return was obtained of all persons in Wales and Monmouth speaking either Welsh only or both Welsh and English, but owing to the imperfection of the results it was prescribed that the corresponding return for 1901 should include those who speak English only, and should exclude children under three years old. In Scotland a similar return of those who speak Gaelic was obtained in 1881, extended at the next census, and made to correspond with the return for Wales for the enumeration of 1901. The complexity of areas does not exist north of the Tweed to anything like the extent to which it prevails in England, but the Local Government Act for Scotland of 1889 afforded means of simplification of which great advantage was taken in the census of 1891. The definition of a house in the north was changed in 1881 so as to correspond with that in use in England, since previously the tenement in the former was the house of the latter, and *vice versa*. For the census of 1901 Scotland was included with England in a single Act, with the necessary modification in nomenclature and other detail. The census of Ireland continues to differ from that of the sister island—first, in that the enumeration is undertaken by the constabulary and the schedule not left to be filled up by the householder; secondly, in the wider use made of statistics other than those directly collected at the census; thirdly, in the collection of statistics of religious denomination, this part of the return, however, being left optional in 1881 and 1891 with the person enumerated. Advantage was taken of this relaxation of the rule in no more than 530 cases on the former occasion, and 871, chiefly in Ulster, on the latter. Finally, a return of temporary illness, of literacy, and fuller detail of house accommodation is here required, under the authority of the Local Government.

The results of the enumerations described above will be found under other heads, and only their most general features need be here set forth. Between the first general census of 1801 and that of 1901 the population of the three kingdoms as a whole increased by 161 per cent. In the case of England and Wales the growth amounted to 271·6 per cent. Scotland shows an increase of 178, whilst Ireland fell off to the extent of 17·3. Thus in 1821, when the census was first taken on a uniform system, the distribution of the total population was in the proportion of 57·4 per cent. in England, 10·0 in Scotland, and 32·6 in Ireland; in 1851 the first had risen to 65·5, the second to 10·6, and the third had fallen to 23·9 per cent., whilst in 1901 the corresponding

relation was 78·4, 10·8, and 10·8 per cent. Scotland stands nearly where she did in 1821, but England has gained and Ireland lost about 21 per cent. in the scale. The following percentages show that the rate of variation has been by no means regular throughout the period in question:—

	1821-31.	1831-41.	1841-51.	1851-61.	1861-71.	1871-81.	1881-91.	1891-1901.
England and Wales	15·8	14·5	12·9	11·9	13·2	14·4	11·7	12·17
Scotland	13·0	10·8	10·2	6·0	9·7	11·2	7·8	11·1
Ireland	14·2	5·5	19·8	11·8	6·7	4·4	9·1	5·3
United Kingdom ¹	15·0	11·2	2·5	5·6	8·8	10·8	8·2	9·9

Comparison of the census figures with the birth and death returns indicates that since 1851 emigration has been the chief retarding influence in all three countries; while in England, at all events, the correlation of the age, birth, and marriage returns seems to indicate a tendency to diminishing fecundity due both to relatively fewer marriages and to the later age at which women enter the conjugal state. A marked decline in the death-rate, in fact, is slightly outweighed by the falling-off in the rate of births. In relation to the area of the three countries, the weight of the population upon a square mile has risen in England and Wales from 153 in 1801 to 553 in 1901. In Scotland the addition has been from 54 to 150, and in Ireland the burden has fallen from 166 to 137.

British Colonies and Dependencies.—In Canada and the Cape the predecessors of the British in European colonization had begun early in the history of their enterprise to take stock periodically of the population and resources of the tracts occupied. In Canada the first return was prepared as early as 1665, and the Netherlands East India Company obtained a rough return in 1687 for the Cape. These, however, can scarcely be included under the head of census, since they were based upon locally-prepared reports mainly relating to agriculture and cattle. Similarly, in New South Wales, “musters” were held annually from the year of settlement; but it was not till 1823 that these assumed the form of a census, and the first regular enumeration was that of 1841, in which Tasmania and New Zealand joined. A census of Cape Colony was taken in 1865, and has been succeeded by others in 1875 and 1891. Natal initiated the operation in the last-named year. In Australia, Queensland has taken a census quinquennially since 1875, and New Zealand since 1881. Uniformity in the procedure of 1891 was secured by a Congress of Statists held in the preceding year. Canada took its first general census in 1871, a year which may be considered the starting-point of the imperial enumeration. India was not included in the synchronous undertaking until 1881, when a population of 254 millions, raised in 1901 to 294 millions, placed the operation at the head of all census enterprise. Each colony and dependency adopts a separate system, and adds such columns to those relating to the primary statistical facts forming the basis of the census as may be required to obtain detail for local purposes. Canada, for instance, follows the plan of the United States, and issues a schedule so voluminous that the official enumerator, specially instructed, has to fill it up, as in Ireland, instead of the householder, and is allowed a month or so for the purpose. In India the same plan is necessary for a far simpler schedule by reason of the general illiteracy of the people, and the census has to be divided accordingly into two operations, the preliminary filling up of the record and the final checking it on the census night. In several of the governments the census has been hitherto confined to the towns or to persons of European descent, and excludes altogether the often large native population, as in Natal and the settlements in Borneo and West Africa, or is satisfied with a rough tribal tally, by families or otherwise, furnished by the chiefs or headmen. In round numbers, the total enumerated population of the British empire is 353 millions, whilst the tracts which still remain uncensused contain an estimated population of about 44 millions, chiefly in Africa. As compared with this total of 397 millions there is the figure of 235 millions published with the census of 1871, that of 254 millions in 1881, and of 372 millions ten years later, none of them claiming more than approximation to accuracy or relating to identical areas.

Other Countries.—Partial enumerations of population and stock were undertaken in several European countries as early as the 17th century on much the same lines as those prescribed by the French authorities in Lower Canada soon after the country was settled. These operations, however, were generally directed towards a special administrative object such as taxation or military service, and, being conducted more or less independently by the authorities of parishes or similar small areas, do not come under the head of

¹ Omitting Man and the Channel Islands.

census. Synchronous enumerations of the population, though suggested on several occasions by eminent men of science, were generally discouraged, probably on the grounds set forth by St Simon, who held that "these impious operations have always irritated the Creator and brought down His heavy hand upon those who ordained them." At all events, although prescribed by the French Convention in 1791 and by its successor in 1793, the census, as we now understand it, is the offspring of the 19th century. France and England led the way in 1801; most of the German states were enumerated in 1816, and shortly afterwards Scandinavia improved on modern lines its already existing system. The United States of America incorporated the periodical census into their Constitution in 1787; but the first enumeration, in 1790, was substantially little more than an experiment. Leaving out of consideration the Turkish dominions, the census at stated intervals has now become the practice of all European States. Russia, the last to adopt it, completed its first enumeration in 1897, the operations embracing a population of 129 millions in two continents. The efforts of statisticians of all countries have been for some time directed towards the establishment of uniformity in the results derivable from the census, and by international conferences a considerable degree of success has been attained. As regards the primary facts to be ascertained, comparison is now very generally possible; and information as to sex, age, civil condition, birthplace, and certain infirmities is becoming of more value at each period. In each country, moreover, special information has to be acquired at the census on topics of local importance which are not equally susceptible of international comparison. For example, many if not most of the European schedules provide columns for one or more of such subjects as mother-tongue, nationality, illiteracy, religious denomination, military service; and in Russia, for the recognized social grades; and in France, for the number of children in each family. Occupation, again, is recorded at nearly all enumerations, though not invariably upon a uniform system nor enjoying so much confidence as to accuracy as the rest. There are, finally, differences of practice as regards the mode of obtaining the record, whether by official agency or on the responsibility of the householder, and in some countries the figure of the actual, in others of the legal, population is the object in view. On the whole, the practical value of periodical enumeration has now been recognized throughout the civilized world, although, for financial or political reasons, the census has not yet become a universal institution. From the following table it will be seen that the great *lacunæ* in this branch of statistics are to be found in the Far East, on the one hand, and amongst the tropical states of the Old and New Worlds on the other:—

Continent.	Population (in thousands).		Percentage Enumerated (1901).
	Enumerated.	Estimated.	
Europe .	387,308	6,314	98·4
Asia .	323,569	550,713	37·0
Africa .	19,741	144,578	12·3
America .	135,118	10,543	92·8
Oceania .	4,771	881	84·5
Total .	870,507	713,029	55·0

(J. A. B.)

United States.—The United States census of 1870 probably marked the lowest ebb of census work in the United States. Its accuracy was generally denied by competent scholars both in and out of the census office. This unfortunate result was due partly to the unsatisfactory character of the law imposing the local work upon officials already burdened with other duties and not subject to the control of the census office, and partly to the disturbed condition of the Southern states immediately after the Civil War. The serious errors were errors of omission, were probably confined to the Southern states, and were especially frequent among the negroes. Since 1870 the development of census work in the United States has been steady and rapid. The law, which had been prepared for the census of 1870 by a committee of the House of Representatives with much care, skill, and ability, but which had failed of enactment at the last moment in the Senate, furnished a basis for greatly improved legislation in 1879, under which the tenth census was taken. By this law the census office for the first time was allowed to call into existence and to control an adequate local staff of supervisors and enumerators. The scope of the work was

so extended as to make the twenty-two quarto volumes of the tenth census almost an encyclopædia, not only of the population, but also of the products and resources of the United States. Probably no other census in the world has ever covered so wide a range of subjects, and perhaps none except that of India and the eleventh American census has extended through so many volumes. The topics usually contained in a census suffered from the great addition of other and less pertinent matter, and the reputation of the work was unfavourably affected by the length of time required to prepare and publish the volumes (the last ones not appearing until near the end of the decade), the original underestimate of the cost of the work, which made frequent supplementary appropriations necessary, the resignation of the superintendent, Francis A. Walker, in 1882, and the disability and death of his successor, Charles W. Seaton. The eleventh census was taken under a law almost identical with that of the tenth, and extended through twenty-five large volumes, presenting a work almost as encyclopædic, but much more distinctively statistical.

The popular opinion of a census, at least in the United States, depends largely upon the degree to which its figures for the population of the country, of states, and especially of cities, meet or fail to meet the expectations of the interested public. Judged by this standard, the census of 1890 was less favourably received than that of 1880. The enumerated population of the country in 1880 was larger than had been anticipated; and in the face of these figures it was difficult for local complaints, even where they were made, to find hearing and acceptance. But according to the eleventh census the decennial rate of growth of population fell suddenly from over 30 per cent., which the figures had shown between 1870 and 1880, and in every preceding decade of the century except that of the Civil War, to less than 25 per cent., in spite of an immigration nearly double that of any preceding decade. For this change no adequate explanation was offered by the census office. Hence the protests of those who believed that the figures for population were too small swelled into a general chorus of dissatisfaction. But the census was probably more correct than the critics. Most of the motives influencing popular estimates of population in the United States tend to exaggeration. The convention which drafted the Constitution of the United States attempted to secure a balance of interests by apportioning both representatives in Congress and direct taxes according to population. A passage in *The Federalist* suggests the motives of the convention as follows:—

As the accuracy of the census to be obtained by Congress will necessarily depend in a considerable degree on the disposition if not co-operation of the states, it is of great importance that the states should feel as little bias as possible to swell or reduce the amount of their numbers. Were their share of representation alone to be governed by this rule, they would have an interest in exaggerating their inhabitants. Were the rule to decide their share of taxation alone, a contrary temptation would prevail. By extending the rule to both objects the states will have opposite interests, which will control and balance each other, and produce a requisite impartiality.

With the disappearance of direct taxation as a source of federal revenue, the motive mentioned for understating the population disappeared. On the other hand, the desire for many representatives in Congress has been reinforced by the more influential feelings of local pride and of rivalry with other cities of somewhat similar size. Hence a complaint that the population is overstated is seldom heard, and hence, also, popular charges of an undercount afford little evidence that the population was really larger than stated by the census.

After the detailed tabulation had been completed, it

was shown that the number of persons under ten years of age in 1890 was surprisingly small, and that this deficiency in children was a leading cause of the slow growth in population. Before the tabulation had been made Mr Francis A. Walker wrote:—"If the birth-rate among the previously existing population did not suffer a sharp decline . . . the census of 1890 cannot be vindicated. To ascertain the facts we must await the tabulation of the population by periods of life, and ascertain how many of the inhabitants of the United States of 1890 were under ten years of age." These results thus confirmed the accuracy of the count of 1890. Efforts to invalidate the census returns by comparison with the registration records of Massachusetts cannot be deemed conclusive, since in the United States, as in Great Britain, the census must be deemed more accurate and less subject to error than registration records. A strong argument in favour of the eleventh census, apart from its self-consistency, is that its results as a whole fit in with the subsequent state enumerations. In eleven cases such enumerations have been taken; and on computing from them and the results of the federal census of 1880 what the population at the date of the eleventh census should have been, if the annual rate of increase had been uniform, it appears that in no case, except New York city and Oregon, was the difference between the enumerations and these estimates over 4 per cent. In Oregon about 30,000 more people were found in 1890 than the estimate would lead one to expect; in New York city, about 100,000 less. It seems not improbable that in the latter, where the difficulties incident to a count during the summer are almost insurmountable, serious omissions occurred. Still, such a comparison confirms the accuracy of the eleventh census as a whole.

The results of the twelfth census (1900) further refute the argument that would maintain the eleventh census to be inaccurate because it showed a smaller rate of increase in population during the preceding decade than had been recorded by other censuses during earlier decades. The rate of increase during the decade ending in 1900 was even less than that for the preceding decade; and it is impossible that a falling off so marked could in two successive enumerations be the result of sheer inaccuracy. The rate of increase from 1890 to 1900, eliminating from the computation the population of Alaska, Hawaii, Indian Territory, and Indian reservations, was 20·7; the rate of increase if these places are included—in which case the figures of the population of Hawaii in 1890 must be taken from the census of the Hawaiian Government in that year—was 21 per cent.

The law regulating the twelfth census deserves to rank with those of 1790, 1850, and 1879 as one of the four important laws relative to census work. By this law the census office was far more independent than ever before. Appointments and removals were made by the Director of the Census rather than by the Secretary of the Interior, and in all plans for the execution of the law the head of the office was responsible for success. The law divided the subjects of census inquiry into two parts—first, those of primary importance, requiring the aid of the enumerator; and, secondly, those of subsidiary importance, capable of production without the aid of the enumerator. The former had to be finished and published by 1st July 1902; the latter were not to be undertaken until the former were well advanced towards completion. By this means the attention of the office could be concentrated on a small number of subjects rather than distributed over the long list treated in the volumes of the tenth and eleventh censuses.

Under the federal form of government, with its delegation of all residuary powers to the several states, the United States have no system of recording deaths, births, and marriages. Hence there is no such basis as exists in nearly every other civilized State for a national system of registration, and the country depends upon the crude method of enumerators' returns for its information on vital statistics, except in the states and cities which have established a trustworthy registration system of their own. These are the New England states and a few others in their vicinity or influenced by their example. Enumerators' returns in this field

are so incomplete that hardly two-thirds of the deaths which have occurred in any community during the preceding year are obtained by an enumerator visiting the families, no satisfactory basis for the computation of death-rates is afforded, and the returns have comparatively little scientific value. In the regions where census tables and interpretations are derived from registration records kept by the several states or cities they are often made more complete than those in the state or municipal documents. The census of agriculture is also liable to a wide margin of error, owing to defects in farm accounts and the inability of many farmers to state the amount or the value even of the leading crops. The census figures relate to the calendar year preceding 1st June 1900, and hurried and careless answers about the preceding year's crop are almost sure to have been given by many farmers in the midst of the summer's work.

The difficulties facing the manufacturing census were of a different character. A large proportion of the industries of the country keep satisfactory accounts, and can answer the questions with some correctness. But manufacturers are likely to suspect the objects of the census, and to fear that the information given will be open to the public or betrayed to competitors. Furthermore, the manufacturing schedule presupposes some uniformity in the method of accounting among different companies or lines of business, and this is often lacking. Another source of error in the manufacturing census of the United States is that the words of the census law are construed as requiring an enumeration of the various trades and handicrafts, such as carpentering. The deficiencies in such returns are gross and notorious, but the census office feels obliged to seek for them and to report what it finds, however incomplete or incorrect the results may be. Even on the population returns certain answers, such as the number of the divorced or the number unable to read and write, may be open to question.

The wide range of the American census, and the publication of uncertain figures, find a justification in the fact that the development of accurate census work requires a long educational process in the office, and, above all, in the community. Rough approximations must always precede accurate measurements; and these returns, while often inaccurate, are, being the best obtainable, better than nothing, and probably improve with each decade.

Besides the breadth of its scope, in which the American census stands unrivalled, the most important American contribution to census work has been the application of electricity to the tabulation of the results, as was first done in 1890. The main difficulties which this method reduced were two. The production of tables for so enormous a population as that of the United States through the method of tallying by hand requires a great number of clerks and a long period of time, and when complete cannot be verified except by a repetition of the process. The new method abbreviates the time, since an electric current can tally almost simultaneously the data, the tallying of which by hand would be separated by appreciable intervals. The method also renders comparatively easy the verification of the results of certain selected parts.

(W. F. W.)

Centerville, the capital of Appanoose county, Iowa, U.S.A., situated in a coal-mining region. Population (1890), 3668; (1900), 5256, of whom 499 were foreign-born and 149 were negroes.

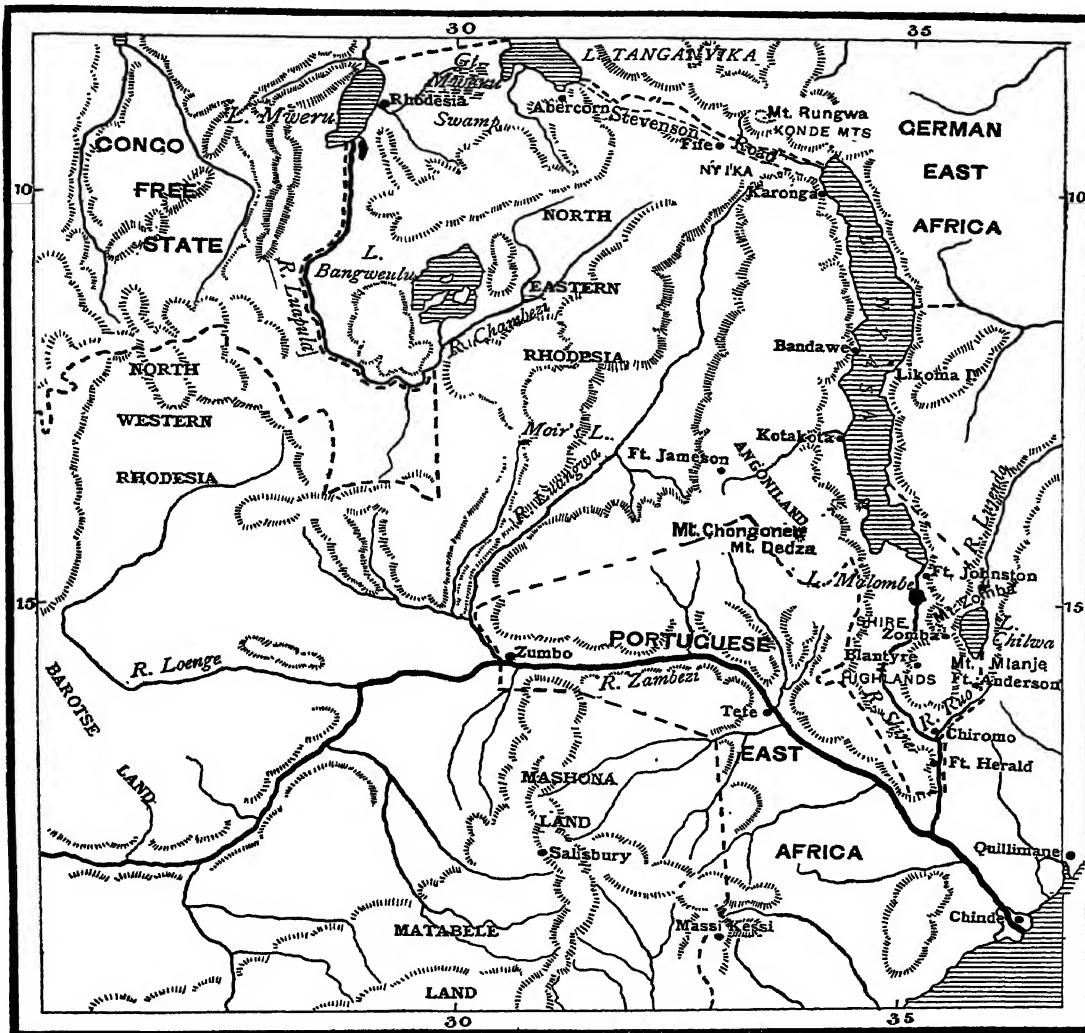

Central Africa, British.—The term given to what is at present a not well defined appendage of the British empire in South Central Africa. Broadly speaking, it may be taken to include a large territory lying between S. latitude 8° 25' on Lake Tanganyika and latitude 17° 6' on the river Shiré, near its confluence with the Zambezi, and between longitude E. 36° 10' (district of Manje) and 28° 20' (river Luapula). Originally the term British Central Africa was first applied by the writer of this article to all the territories under British influence to the north of the Zambezi, which were formerly intended to be under one administration; but the course of events having obviated the connexion of Barotseland (see BAROTSE) with any direct British administration north of the Zambezi, the term British Central Africa is now confined to the British Protectorate on the Shiré and about Lake Nyasa; the titles "North-Eastern Rhodesia" and "North-Western Rhodesia" have been officially applied to the two divisions of the British South Africa Company's territory north of the Zambezi. The western boundary, however, of the territory here described has been

taken to be a line drawn from the south-easternmost corner of the Congo Free State frontier to the north-westernmost corner of the Portuguese possessions on the east bank of the Luangwa river. Within these limits we have a territory of about 150,000 square miles, which includes two-thirds of Lake Nyasa, the south end of Lake Tanganyika, more than half Lake Mweru, and the whole of Lake Bangweulu, nearly the whole courses of the rivers Shiré and Luangwa, the whole of the river Chambezi (the head-waters of the river Congo), the right or east bank of the Luapula (or Upper Congo) from its exit from Lake Bangweulu to its issue from the north end of Lake Mweru.

itself into the Lujenda river, and thence into the Indian Ocean.

As regards orographical features, much of the country is high plateau, with an average altitude of 3500 feet above sea-level. Only a very minute portion of its area—the country along the banks of the river Shiré—lies at anything like a low level; though the Luangwa valley may not be more than about 900 feet above sea-level. Lake Nyasa lies at an elevation of 1700 feet above the sea, is about 350 miles long, with a breadth varying from 15 to 40 miles. Lake Tanganyika is about 2680 feet above sea-level, with a length of about 400 miles and an average breadth of nearly 40.

Lake Mweru and Lake Bangweulu are respectively 3000 feet and 3760 feet above sea-level; Lake Chilwa is 1946 feet in altitude. The highest mountain found within the limits previously laid down is Mount Mlanje, in the extreme south-eastern corner of the Protectorate. The highest peak of Mlanje reaches an altitude of 9683 feet. (In German territory, near the north end of Lake Nyasa, and close to the British frontier, is Mount Rungwa, the altitude of which exceeds 10,000 feet.) Other high mountains are Mounts Chongone and Dedza, in Angoniland, which reach an altitude of 7000 feet, and points on the Nyika Plateau and in the Konde Mountains to the north-west of Lake Nyasa, which probably exceed a height of 8000 feet. There are also Mounts Zomba (6900 feet) and Chiradzulu (5500 feet) in the Shiré Highlands. The principal plateaux or high ridges are (1) the Shiré Highlands, a clump of mountainous country lying between the river

SKETCH MAP OF BRITISH CENTRAL AFRICA.

Other lesser sheets of water included within the limits of this territory are the Great Mweru Swamp, between Tanganyika and Mweru, Moir's Lake (a small mountain tarn lying between the Luangwa and the Luapula), Lake Malombe (on the upper Shiré), and the salt lake Chilwa, which lies on the borders of the Portuguese province of Moçambique. The southern border of all this territory is separated from the river Zambezi by the Portuguese possessions; nevertheless, considerably more than two-thirds of the country lies within the Zambezi basin, and is included within the subordinate basins of Lake Nyasa and of the river Luangwa. The remaining portions drain into the basins of the river Congo and of Lake Tanganyika, and also into the small Lake Chilwa, which at the present time has no outlet, though in past ages it probably emptied

Shiré, the river Ruu, Lake Chilwa, and the south end of Lake Nyasa; (2) Angoniland—a stretch of elevated country to the west of Lake Nyasa and the north-west of the river Shiré; (3) the Nyika Plateau, which lies to the north of Angoniland; and (4) the Nyasa-Tanganyika Plateau, between the basin of the river Luangwa, the vicinity of Tanganyika, and the vicinity of Lake Mweru. Finally may be mentioned the tract of elevated country between Lake Bangweulu and the river Luapula, and between Lake Bangweulu and the basin of the Luangwa.

The whole of this part of Africa is practically without any stretch of desert country, being on the whole favoured with an abundant rainfall. The nearest approach to a desert is the rather dry land to the east and north-east of Lake Mweru. Here, and in parts of the lower Shiré

district, the annual rainfall probably does not exceed an average of 35 inches. Elsewhere, in the vicinity of the highest mountains, the rainfall may attain an average of 75 inches, in parts of Mount Mlanje possibly often reaching to 100 inches in the year. The average may be put at 50 inches per annum, which is also about the average rainfall of the Shire Highlands, that part of British Central Africa which at present attracts the greatest number of European settlers.

No part of the country comes within the forest region of West Africa. The whole of it may be said to lie within the savannah or park-like division of the continent. As a general rule the landscape is of a pleasing and attractive character, well covered with vegetation and fairly well watered. Actual forests of lofty trees, forests of a West African type, are few in number, and are chiefly limited to portions of the Nyika, Angoniland, and Shire Highlands plateaux, and to a few nooks in valleys near the south end of Tanganyika. Patches of forest of tropical luxuriance may still be seen on the slopes of Mounts Mlanje and Chiradzulu. On the upper plateaux of Mount Mlanje there are forests of a remarkable conifer (*Widdringtonia whytei*), a relation of the cypress, which in appearance resembles much more the cedar, and is therefore wrongly styled the "Mlanje cedar." This tree is remarkable as being the only conifer found growing in Central Africa between the mountains of Cape Colony and Natal in the south, and the highlands of Kilima-Njaro, Kenia, and Abyssinia in the north.¹ Immense areas in the lower-lying plains are covered by long, coarse grass, sometimes reaching 10 feet in height. Most of the West African forest trees are represented in British Central Africa. A full list of the known flora has been compiled by Sir W. Thiselton-Dyer and his assistants at Kew, and is given in the first and second editions of Sir H. H. Johnston's work on British Central Africa. Amongst the principal vegetable products of the country interesting for commercial purposes may be mentioned coffee (wild coffee is said to grow in some of the mountainous districts, but the actual coffee cultivated by the European settlers has been introduced from abroad); indiarubber—derived chiefly from the various species of *Landolphia* and from other apocynaceous plants; the *Strophanthus* pod (furnishing a valuable drug); ground nuts (*Arachis* and *Voandzeia*); the cotton plant; all African cultivated cereals (sorghum, pennisetum, maize, rice, wheat—cultivated chiefly by Europeans—and eleusine); and six species of palms—the oil palm on the north-west (near Lake Nyasa, at the south end of Tanganyika, and on the Luapula), the *Borassus* and *Hyphæne*, *Phoenix* (or wild date), *Raphia* and the coconut palm. The last-named was introduced by Arabs and Europeans, and is found on Lake Nyasa and on the Lower Shire. Most of the European vegetables have been introduced, and thrive exceedingly well, especially the potato. The mango has also been introduced from India, and has taken to the Shire Highlands as to a second home. Oranges, lemons, and limes have been planted by Europeans and Arabs in a few districts. European fruit-trees do not ordinarily flourish, though apples are grown to some extent at Blantyre. The vine hitherto has proved a failure. Pineapples give the best result amongst cultivated fruit, and strawberries do well in the higher districts. In the mountains the native wild brambles give blackberries of large size and excellent flavour.

The fauna is on the whole very rich. It has affinities in a few respects with the West African forest region, but

differs slightly from the countries to the north and south by the absence of such animals as prefer drier climates, as for instance the oryx antelopes, gazelles, and the ostrich. There is a complete blank in the distribution of this last between the districts to the south of the Zambezi and those of East Africa between Victoria Nyanza and the Indian Ocean. The giraffe is found in the Luangwa valley; it is also met with in the extreme north-east of the country. The ordinary African rhinoceros is still occasionally, but very rarely, seen in the Shire Highlands. The African elephant is fairly common throughout the whole territory. Lions and leopards are very abundant; the zebra is still found in great numbers, and belongs to the Central African variety of Burchell's zebra, which is completely striped down to the hoofs, and is intermediate in many particulars between the true zebra of the mountains and Burchell's zebra of the plains. The principal antelopes found are the sable and the roan (*Hippotragus*), five species of *Cobus* or waterbuck (the puku, the Senga puku, the lechwe, Crawshaw's waterbuck, and the common waterbuck); the pallah, the tessébe, the hartebeest, the gnu, the duyker, the klip-springer, the oribi, the steinbok, and the reedbuck. Among tragelaphs are the bushbuck, the inyala, the water tragelaph (*Tragelaphus selousi*), the kudu, and Livingstone's eland. The only buffalo is the common Cape species. The hyæna is the spotted kind. The hunting dog is present. There are some seven species of monkeys, including two baboons and one colobus. The hippopotamus is found in the lakes and rivers, and all these sheets of water are infested with crocodiles, apparently belonging to but one species, the common Nile crocodile.

The human race is represented by only one indigenous native type—the Negro. No trace is anywhere found of a Hamitic intermixture. Arabs from Zanzibar have settled in the country of late years, but not, as far as we know, from any period exceeding a century back. As the present writer takes the general term "Negro" to include equally the Hottentot, Bushman, and Pigmy tribes of Africa, this designation will cover all the natives of British Central Africa; they exhibit, however, in some parts signs of Hottentot or Bushman intermixture, and there are legends in some mountain districts of the former existence of unmixed Bushman tribes, while Bushman stone implements are found at the south end of Tanganyika. At the present day the population is, as a rule, of a black or chocolate-coloured Negro type, and belongs, linguistically, entirely and exclusively to the Bantu family. The languages spoken offer several very interesting forms of Bantu speech, notably in the districts between the north end of Lake Nyasa, the south end of Lake Tanganyika, and the river Luapula. In the more or less plateau country included within these geographical limits the Bantu dialects are of a very archaic type, and to the present writer it has seemed as though one of them, Kiemba—or Kiwemba—came nearer than any other spoken tongue to the original form of the Bantu mother language. Through dialects spoken on the west and north of Tanganyika these languages of the northern districts are somewhat closely connected with the Bantu dialects of Uganda. They also offer some resemblance to Zulu-Kaffir, and it would seem as though the Zulu-Kaffir race must have come straight down from the countries to the north-west of Tanganyika, across the Zambezi, to their present home. Curiously enough, some hundreds of years after this southward migration, intestine wars and conflicts actually determined a north-westward return migration of Zulus. From Matabeleland Zulu tribes crossed the Zambezi at various periods (commencing from about eighty years ago), and gradually extended their ravages and dominion over the plateaux to the west,

¹ The present writer has explored the Cameroon Range in West Equatorial Africa, and found no conifer there. It would seem therefore as though conifers had been limited in their African distribution to the eastern half of the continent.

north, and north-east of Lake Nyasa. The Zulu language is still spoken by the dominating caste in West Nyasaland. As regards foreign settlers in this part of Africa, the Arabs may be mentioned first, though they are now met with only in very small numbers. The Arabs undoubtedly first heard of this rich country—rich not alone in natural products such as ivory, but also in slaves of good quality—from their settlements on the river Zambezi, and these settlements date back to a very early period, and are possibly coeval with the pre-Islamite Arab settlements in the gold-bearing regions of South-East Africa. But the Arabs do not seem to have made much progress in their penetration of the country in the days before firearms; and when firearms came into use they were for a long time forestalled by the Portuguese, who ousted them from the Zambezi. But about one hundred years ago the increasing power and commercial enterprise of the Arab sultanate of Zanzibar caused the Arabs of Maskat and Zanzibar to march inland from the east coast. They gradually began to found strong slave-trading settlements on the east and west coasts of Lake Nyasa, and thence westwards to Tanganyika and the Luapula. They never came in great numbers, however, and, except here and there on the coast of Lake Nyasa, have left no mixed descendants in the population. Of Europeans British Central Africa proper (the Protectorate) now possesses about 450 settlers, including about 100 officials and military and naval officers. The Europeans are chiefly natives of the United Kingdom, but there are a few Germans, Dutchmen, French, Italians, and Portuguese. The British protectorate established over Central Africa has attracted an increasing number of Indian traders, besides whom about 300 British Indian soldiers (Sikhs) are employed as the nucleus of an armed force.

The total value of the trade of the British Central Africa Protectorate in the year 1899-1900 was £255,384, showing an increase of 75 per cent. on the figures for the previous year. Imports were valued at £176,035, an increase of 62 per cent., and exports at £79,449, an increase of 109 per cent. The principal exports are coffee, rubber, and ivory. A number of Englishmen and Scotsmen (perhaps a hundred) are settled, mainly in the Shiré Highlands, as coffee planters. A railway from the coast to Lake Nyasa is now considered, however, to have become an imperative necessity if the trade of the Protectorate is still further to increase. The African trans-continental telegraph line runs through the Protectorate, and a branch line has been established from Lake Nyasa to Fort Jameson, the present headquarters of the Chartered Company in North-Eastern Rhodesia. The principal European settlement or town is Blantyre, at a height of about 3300 feet above the sea, in the Shiré Highlands. This place was named after Livingstone's birthplace, and was founded in 1876 by the Church of Scotland Mission. The Government capital, however, is Zomba, at the base of the mountain of that name. Other townships or sites of European settlements are Port Herald (on the lower Shiré), Chiromo (at the junction of the Ruo and the Shiré), Fort Anderson (on Mt. Mlanje), Fort Johnston (near the outlet of the river Shiré from the south end of Lake Nyasa), Kotakota and Bandawe (on the west coast of Lake Nyasa), Likoma Island (off the east coast of Lake Nyasa), Karonga (on the north-west coast of Lake Nyasa), Fife (on the Nyasa-Tanganyika plateau), Abercorn (on the south end of Lake Tanganyika), and Rhodesia (on the east coast of Lake Mweru). The present political divisions of the country are as follows:—The districts surrounding Lake Nyasa and the Shiré Province are governed directly under the Imperial Government by a Commissioner, who

acts under the orders of the Foreign Office. The districts to the westward forming the province of Northern Rhodesia are governed by an official of the British South Africa Chartered Company under the direction of the aforesaid Commissioner and of the Foreign Office. In process of time the two administrations will probably be fused in name as they are already in actuality.

History.—The history of the territory dealt with above is recent and slight. Apart from the vague Portuguese wanderings during the 16th and 17th centuries, the first European explorer of any education who penetrated into this country was the celebrated Portuguese official, Dr F. J. M. de Lacerda e Almeida, who journeyed from Tete on the Zambezi to the vicinity of Lake Mweru. But the real history of the country begins with the advent of Livingstone, who in 1859 penetrated up the Shiré river and discovered Lake Nyasa. Livingstone's subsequent journeys to the south end of Tanganyika, to Lake Mweru, and to Lake Bangweulu (where he died in 1873), opened up this important part of South Central Africa and centred in it British interests in a very particular manner. Livingstone's death was soon followed by the entry of various missionary societies, who commenced the evangelization of the country; and these missionaries, together with a few Scottish settlers, steadily opposed the attempts of the Portuguese to extend their sway in this direction from the adjoining provinces of Moçambique and of the Zambezi. From out of the missionary societies grew a trading company, the African Lakes Trading Corporation. This body came into conflict with a number of Arabs who had established themselves on the north end of Lake Nyasa. About 1885 a struggle began between Arab and Briton for the possession of the country, which was not terminated until the year 1896. The African Lakes Corporation in its unofficial war enlisted volunteers, amongst whom were Captain (afterwards Brigadier-General) Lugard and Mr Alfred Sharpe. Both these gentlemen were wounded, and the operations they undertook were not crowned with complete success. The present writer was sent out in 1889 to endeavour to effect a possible arrangement of the dispute between the Arabs and the African Lakes Corporation, and also to ensure the protection of friendly native chiefs from Portuguese aggression beyond a certain point. The outcome of these efforts and the treaties made was the creation of the British Protectorate and sphere of influence north of the Zambezi. In 1891 Mr (afterwards Sir) Harry Johnston returned to the country as Imperial Commissioner and Consul-General. In the interval between 1889 and 1891 Mr Alfred Sharpe, on behalf of Mr Rhodes, had brought a large part of the country into treaty with the British South Africa Company. These territories, now known as Northern Rhodesia, were administered for a considerable period by the present writer in connexion with the British Central Africa Protectorate. Between 1891 and 1895 a long struggle continued between the British authorities on the one hand and the Arabs and Mahomedan Yaos on the other regarding the suppression of the slave trade. By the beginning of 1896 the last Arab stronghold was taken and the Yaos were completely reduced to submission. Then followed during 1896-98 wars with the Zulu tribes, who claimed to dominate and harass the native populations to the west of Lake Nyasa. The Zulus having been subdued, there was every prospect of the country enjoying a settled peace and considerable prosperity. The native population numbers about 2,000,000, and is well disposed towards European rule, having indeed at all times furnished the principal contingent of the armed force with which the African Lakes Company or the British Government endeavoured to oppose Arab or Zulu aggression. The

640 CENTRAL AMERICA—CENTRAL PROVINCES

Imperial Government maintains six gunboats on Lake Nyasa and the rivers Shiré and Zambezi. The actual native (African) strength of the 1st battalion British Central Africa Regiment in 1900 was 865; a 2nd battalion was raised for service outside the Protectorate.

Unfortunately, though so rich and fertile, the land is not as a rule very healthy for Europeans, though of late it has shown signs of improvement in this respect. The principal scourge is black-water fever, which appears to be a result of the opening up of fresh untillied soil to cultivation. The climate is agreeable, and except in the low-lying districts is never unbearably hot; while on the high mountain plateaux frost frequently occurs during the dry season.

See *The Lands of Cazembe* (Dr Lacerda's journey to Cazembe in 1898), a compilation by the late Sir R. F. BURTON.—*The Second Zambezi Expedition and Last Journeys of Dr Livingstone*, by the late Rev. HORACE WALLER.—*The Life of Livingstone*, by Sir H. H. JOHNSTON.—*Captain ELTON's Travels in East Africa—Adventures in Nyasaland*, by L. MONTEITH FOTHERINGHAM.—*To the Central African Lakes and Back*, by JOSEPH THOMSON.—*An Encyclopædic Dictionary of the Manganya Language as spoken in British Central Africa*, by the Rev. D. C. SCOTT.—*British Central Africa*, by Sir H. H. JOHNSTON.—*Africana*, by the Rev. ALEXANDER DUFF.—*The Shiré Highlands*, by JOHN BUCHANAN.—*Three Years in Savage Africa*, by LIONEL DÉCLE. (H. H. J.)

Central America, that portion of the American continent which lies between Mexico and Colombia, and comprises the area of the five states of Guatemala, Honduras, Salvador, Nicaragua, and Costa Rica. An attempt, in which the Guatemalan president was the chief mover, was made in 1884 and 1885 to unite these states in a Central American federation, but both constitutional methods and military coercion failed. In 1895 the three states of Honduras, Salvador, and Nicaragua united for the purposes of foreign relations in a confederation called the Greater Republic of Central America. A Diet was convened and officials were appointed for the direction of affairs; but in 1898, when the new régime was on the

point of commencing, a revolution overthrew the Salvadorian government, and the Greater Republic separated into its constituent states.

Central Falls, a city in Providence county, Rhode Island, U.S.A., formed from a part of Lincoln town. It is on Blackstone river and on a branch of the New York, New Haven and Hartford railway. It has extensive manufactures, principally of cotton and woollen goods. Population (1900), 18,167.

Central India, the official name of a collection of native states under a political agent to the Governor-General, who resides at Indore. They cover a large tract of country eastward of Rajputana, including Malwa, and extending northwards from the Nerbudda river to the Chambal and the Sone. There are seven subordinate agencies: Gwalior, Indore, Bhopal, Bhopawar, West Malwa, Bundelkhand, and Baghelkhand. Their total area is 77,808 square miles. The population in 1881 was 9,387,119; in 1891 it was 10,318,812, showing an increase of 10 per cent. and an average density of 133 persons per square mile. In 1901 the population was 8,501,883, showing a decrease of 17 per cent., due to the effects of famine, which was most severely felt in Bhopal and West Malwa. The whole is now fairly provided with railways, largely at the expense of Sindhia. There are British cantonments at Mhow, Neemuch, and Nowgong.

Central Provinces, the official name of a province of British India, under the administration of a chief commissioner. It lies in the very middle of the peninsula, and comprises several native states still in a backward stage of civilization. The total area, including feudatory states, occupies 115,936 square miles; in 1891 the population was 12,944,805. The capital is Nagpur.

Population.—The following table gives the area and population of the Central Provinces in 1891:—

British Territory.		Area in Square Miles.	Number of Towns and Villages.	Population, Census of 1891.			Density of Population to Square Mile.	Population, Census of 1881.
Divisions.	Districts.			Males.	Females.	Total.		
Nagpur	Nagpur	3,843	1,691	382,863	374,999	757,862	197	697,856
	Bhandara	8,908	1,620	366,696	376,154	742,850	187	688,779

Total Native States		29,435	10,407	1,089,011	1,071,500	2,160,511	73	1,709,720
Grand Total		115,936	44,762	6,486,315	6,458,490	12,944,805	111	11,548,511

Between 1881 and 1891, population increased at the rate of 9·6 per cent. in British territory, and at the rate of 26 per cent. in native states. Classified according to religion, in British districts only, Hindus numbered 8,831,467, or 82 per cent. of the total

population; Mahomedans, 297,604, or 2·8 per cent., mostly confined to the towns, being a much smaller proportion than in any other province of India. Aboriginal tribes numbered 1,592,149, or 15 per cent., the proportion rising to as high as 46 per cent. in the four hill districts on the Satpura range. Most of these are Gonds, who still preserve their own language, spoken by 1,379,580 persons in all India. In the native states the proportion of aboriginal tribes was 23 per cent. Christians numbered 12,979, or 1·2 per cent., of whom 4782 were Europeans, 2105 Eurasians, and 578 Indo-Portuguese, leaving 5514 for native converts, chiefly in the two districts of Nagpur and Raipur. In the native states the total number of Christians was 338, having risen from 24 since the previous census. Jains numbered 48,644, chiefly in Saugor district; Parsis, 781, chiefly in Nagpur; and "others," 938.

The preliminary returns of the census of 1901 gave a total population for the British districts of 9,845,318, showing a decrease of 938,976 or 8·7 per cent., due to the results of famine. In the feudatory states the population in 1901 was 1,983,496, showing a decrease of 8 per cent.

Out of a total surveyed area of 55,413,037 acres, the area assessed to land revenue is 28,486,863, the average incidence being Rs.0:4:7 (say 5d.) per acre. In 1897-98 the total cultivated area was 15,390,504 acres, of which 1,134,727 acres were cropped more than once. The total irrigated area was 562,628 acres, almost entirely rice-land watered from tanks. There are no Government canals. The principal crops are rice (in Ohhattisgarh), wheat (in the Nerbudda valley), millet, pulse, oil-seeds, and cotton (in the Wardha valley). In 1896-97 the total area under cotton was 737,104 acres.

Industries.—The only important industries are connected with cotton and coal. In 1897 the total number of factories under Government inspection was 35, of which 26 worked in cotton. The total number of hands employed was 10,359, of whom 509 were children. The number of cotton-mills was 6, all owned by companies having a nominal capital of Rs.70,00,000, with 1708 looms and 124,610 spindles, working up in the year 200,000 cwt. of raw cotton, and employing 6980 hands, of whom 4830 were adult males. The total out-turn was 18,334,320 lb of yarn, chiefly of counts between Nos. 6 and 22; and 5,110,292 lb of woven goods. There are also about 30 factories for cleaning and pressing cotton. In 1896 a brewery was established at Jubbulpore, with an out-turn of 155,000 gallons. Two coal-mines are worked in the Central Provinces, at Warora and Mopani, to each of which there is a branch line of railway. In 1897-98 the output of the Warora colliery was 115,682 tons. The number of persons employed was 1435, of whom 1263 were adult males. In connexion with the colliery there is a firebrick business, which raised 2065 tons of fireclay and sold firebricks and tiles to the value of Rs.34,948. The Mopani colliery, which dates back to 1860, is worked by a joint-stock company. In 1898 the output was 22,472 tons, and the number of persons employed 276.

Railways.—Until recently, the only railway in the Central Provinces was the Great Indian Peninsula, with two branches, one terminating at Nagpur, the other at Jubbulpore, whence it was continued by the East Indian system to Allahabad. The Bengal-Nagpur line has now opened up the eastern portion of the country, bringing it into direct connexion with Calcutta; and a new branch of the Indian Midland, from Saugor through Damoh, has been partly constructed as a famine work. Large portions, however, in the hilly centre and in the south-east, are still remote from railways.

Trade.—The trade of the Central Provinces is conducted mainly by rail with Bombay and with Calcutta. The following table gives the average value of imports and exports for three quinquennial periods ending 1887-88, 1892-93, and 1897-98:—

	Imports.	Exports
	Rs.	Rs.
Average, 1883-84 to 1887-88	3,54,32,617	4,16,27,507
" 1888-89 to 1892-93	3,42,23,856	5,19,61,509
" 1893-94 to 1897-98	4,33,44,883	5,11,24,312

The chief imports are cotton piece goods, cotton twist, salt, sugar, provisions, railway materials, raw cotton, metals, coal, tobacco, spices, and kerosene oil. The chief exports are raw cotton, rice, wheat, oil-seeds, hides, and lac. The exports of wheat are liable to extreme fluctuations. During the five years ending 1887-88 they averaged nearly 8 million maunds; in 1888-89 they reached their maximum of 10 million maunds; during the five years ending 1897-98 they averaged only 2 million maunds, while in the famine year, 1897-98, they dropped to 280,000 maunds.

Local Government.—The total number of civil and revenue courts is 245, and of criminal courts, 385. In 1898 the total number of police was 8606. The total number of municipalities

in the Central Provinces is 53, with an aggregate population of about 800,000. In all of them, except the hill station of Pachmarhi, a majority of the municipal committee is elected. Out of a total of 623 members, 445 are elected, and 565 are natives of India. In 1897-98 the aggregate municipal income was Rs.13,91,958, of which Rs.8,08,782 was derived from octroi and Rs.86,422 from water-rates. The aggregate municipal expenditure was Rs.13,95,266, of which Rs.2,69,986 was devoted to conservancy, Rs.1,28,896 to waterworks, Rs.1,51,490 to education, Rs.73,616 to public works, and Rs.80,067 to hospitals. In every district, except Mandla, there is a district council, with subordinate local boards. The total number of members of these bodies is 1197, of whom 913 are elected and 1162 are natives of India. The aggregate income was Rs.7,97,158, of which Rs.3,76,000 was derived from local rates and Rs.1,95,000 from cattle pound fees. The aggregate expenditure was Rs.7,18,221, of which Rs.2,89,000 was devoted to education, Rs.1,94,000 to roads and public works, and Rs.87,000 to hospitals and sanitation.

The net revenue and expenditure of the Central Provinces (in tens of rupees) for 1897-98 was as follows, distributed under the three heads of imperial, provincial, and local:—Net revenue, imperial, Rx.377,503; provincial, Rx.835,210; local, Rx.75,555; total, Rx.1,288,268. Net expenditure, imperial, Rx.1,189,376; provincial, Rx.821,193; local, Rx.89,572; total, Rx.2,100,141. The chief sources of revenue were: land, Rx.664,856; excise, Rx.173,168; stamps, Rx.158,414.

Education.—The following table gives the chief statistics of education in the Central Provinces for the decennial years 1886-87 and 1896-97:—

	1886-87.		1896-97.	
	Schools.	Pupils.	Schools.	Pupils.
Colleges	3	100	5	312
Secondary Schools	71	4,216	248	26,216
Primary Schools	1799	102,173	2262	122,616
Special Schools	18	463	9	363
Private Institutions	4	49
Total	1895	107,001	2524	149,507

Compared with the estimated population of school-going age (15 per cent. of the total population), the proportion of boys at school rose between 1895 and 1901 from 11·3 to 14·2 per cent., and the proportion of girls from 8 to 1·1 per cent. The expenditure on education was, in 1886-87, Rs.8,19,228; in 1896-97, Rs.10,52,805.

Famine.—The Central Provinces have suffered from famine more severely than any other part of India. The complete failure of rain in the autumn of 1896 caused scarcity to develop suddenly into famine, which lasted until the end of 1897. The total number of persons in receipt of relief reached its maximum of nearly 700,000 in May 1897. The expenditure on relief alone was Rs.1,56,10,739 (say 1 million sterling); and the total cost of the famine, including loss of revenue, amounted to nearly twice that amount. During 1897 the death-rate for the whole province rose to 69 per thousand, or double the average, while the birth-rate fell to 27 per thousand. The Central Provinces were stricken by another famine, yet more severe and widespread, caused by the complete failure of the rains in 1899. The maximum of persons relieved for the whole province was 1,971,000 in June 1900. In addition, about 68,000 persons were in receipt of relief in the native states. During the three years 1889-1902 the total expenditure on famine relief amounted to Rs.6,10,81,000 (say 4 millions sterling).

See R. H. CRADDOCK. Report on *The Famine in the Central Provinces in 1896 and 1897*. Nagpur, 1898. (J. s. Co.)

Centralia, a city of Marion county, Illinois, U.S.A., situated south of the centre of the state, on the Illinois Central railway and three smaller railways, at an altitude of 490 feet. It contains works of the Illinois Central railway, coal-mines and iron-works. Population (1880), 3621; (1890), 4763; (1900), 6721, of whom 571 were foreign-born and 418 were negroes.

Centuripe, formerly CENTORBI, a town of Sicily, Italy, in the province of Catania, 32 miles N.W. from Catania (28 miles by rail to Catenanuova; thence 4 miles by road). It stands on a cliff (2307 ft.) overlooking the valley of the Simeto, and carries on sulphur-mining and flour-milling. The ancient *Centoripa*, it was a town of considerable importance both in Sikelian and in Roman times, but was

destroyed by the Emperor Frederick II. as a punishment for having revolted, and its inhabitants were removed to Augusta. Numerous antique vases, coins, &c., have been found in the vicinity. Population, about 10,000.

Cephalonia. See GREECE (*Ionian Islands*).

Ceram, or Sirang, an island of the Dutch East Indies, north of Amboyna. Area, 6612 square miles. Professor Martin has demonstrated the similarity of its geological structure—consisting chiefly of eruptive rocks and crystalline limestone—to that of northern Amboyna. The isthmus connecting the two parts of the island is very narrow, and has a height of only 460 to 490 feet. In the eastern section the prevailing rock is crystalline chalk, similar to that of Buru. No central chain of mountains stretches west and east through the island, but near the north coast mountains, rising 2300 to 2600 feet, slope steeply to the shore. Near the south coast, west of the Bay of Elpaputi, a complex mass of mountains forms a colossal pyramid, with peaks rising to nearly 5000 feet. The rivers flow north and south into bays, but are navigable only for a few miles during the rainy season. On the north coast the bays of Savai and Waru are accessible for small vessels. Besides other products, tobacco is cultivated for the European market. The island, which belongs to the Residency of Amboyna, is divided into Kairatu or West Ceram, Wahai and Amahei, the northern and the southern parts of Middle Ceram, and Waru or Eastern Ceram. Recent estimates give only 100,000 for the population (of whom 12,000 are Christians and 16,000 Mahomedans). About 4000 persons perished in the earthquake of 1899.

Ceramics. See POTTERY.

Cernuschi, Henri (1821-1900), Italian politician and economist, was born of wealthy parents at Milan in 1821, and was destined for the legal profession. During his studies he became involved in the revolutionary movement. He played a conspicuous part in the insurrection at Milan in 1848, and also at Rome in 1849, where he had a seat in the National Assembly. On the collapse of the Revolutionary Government he was arrested (1850), but managed to escape to France, where he engaged in commerce and banking, became naturalized, and acquired a large fortune. He took a prominent part in opposing the Socialist movement, and in April 1870, having subscribed a large sum to the funds of a committee formed to combat the Napoleonic plebiscite, had to leave the country. In September the formation of the Third Republic enabled him to return, but he soon left Paris to travel in the East, whence he returned with a fine art collection, particularly of Japanese objects. Cernuschi is best known for his publications on financial questions, more especially bimetallism. Of the latter he was an ardent champion, and the word itself is commonly supposed to have originated with him—at least in its English form it is first found in his *Silver Vindicated* (1876). Among his other works may be mentioned: *Mécanique de l'échange* (1861); *Illusion des sociétés coopératives* (1866); *Le Bimétallisme en Angleterre* (1879); *Le grand procès de l'Union latine* (1884). He died in 1900. (J. M'F.)

Cerro de Pasco, or PASCO, a town of Peru, in the department of Junin, with a population estimated at about 15,000, wholly devoted to mining. The average annual output of the silver mines has since their opening been about 1,600,000 ounces of pure silver. It is estimated that the copper deposits contain 15 million tons of ore, or about 3 million tons of metallic copper. They will probably be worked as soon as the railway from Oroya can be built, which will put the mines in direct communication with Callao.

Cervera, Pascual Cervera y Topete (1839—), Spanish admiral, was born at Medina Sidonia on 18th February 1839. He showed an early inclination for the sea, and his family sent him to the Naval Cadet School at the age of twelve. As a sub-lieutenant he took part in the naval operations on the coast of Morocco during the campaign of 1859-60. Then he was for some time engaged in operations in the Sulu Islands and the Philippines. Afterwards he was on the West Indian station during the early part of the first Cuban war (1869-78), returning to Spain in 1873 to serve on the Basque coast against the Carlists. He distinguished himself in defending the Carraca arsenal near Cadiz against the Federals in 1873. He won each step in his promotion up to flag-rank through his steadiness and brilliant conduct in action, and was awarded the crosses of the Orders of Military and Naval Merit, Isabella the Catholic, and St Hermengilde, besides several medals. Cervera had a great reputation for decision, unbending temper and honesty, before he was placed at the head of the Bilbao building-yards. This post he resigned after a few months in order to become Minister of Marine in 1892, in a Cabinet presided over by Sagasta. He withdrew from the Cabinet when he found that his colleagues, from political motives, declined to support him in making reforms and, on the other hand, unwisely cut down the naval estimates. When the war broke out with the United States, Cervera was selected to command a squadron composed of four first-class cruisers, the *Maria Theresa*, his flagship, *Oquendo*, *Vizcaya*, and *Columbus*, and several destroyers. This ill-fated squadron only started upon its reckless cruise across the ocean after its gallant commander had repeatedly warned both the Minister of Marine and the Prime Minister, Sagasta, in despatches from Cadiz and from the Canary and Cape Verde Islands, that the ships were insufficiently provided with coal and ammunition. Some of them, indeed, even lacked proper guns. In compliance with the instructions of the Government, Admiral Cervera made for the landlocked harbour of Santiago de Cuba, where he co-operated in the defence, landing some guns and a naval brigade. In spite of his energetic representations, Cervera received an order from Madrid, dictated by political considerations, to sally forth. It meant certain destruction. The gallant squadron met forces trebly superior to it, and was totally destroyed. The admiral, three of his captains, and 1800 sailors and marines were taken by the victors to Portsmouth, in the United States. After the war, Cervera and his captains were tried before the supreme naval and military court of the realm, which honourably acquitted them all.

Cette, a seaport of France, in the arrondissement of Montpellier, department of Hérault, 17 miles S.W. of that town, on the railway from Bordeaux to Montpellier. The total value of imports (general commerce) in 1899 was £5,192,000, and of the exports £1,372,000. In 1899 the number of vessels entered was 1135, tonnage 615,006 (of which 54 of 41,762 tons were from England); and cleared 1090, tonnage 556,059. Trade is chiefly carried on with Spain (about half the total). The foregoing figures do not include the coasting trade, in connexion with which 757 vessels of 379,187 tons entered and 752 of 381,664 tons cleared. The harbour comprises three basins and a comprehensive system of canals, the total area of which is 111 acres, and the total length of quayage 9656 yards. Further improvements are in progress. Population (1881), 32,665; (1901), 33,065.

Cettigne (CETINJE), the capital of the principality of Montenegro, situated in a hollow plain (*Polje*)

deeply sunk in the heart of the limestone mountains, at a height of 2470 feet above the sea. It consists of some streets and a large market-place of little, clean houses, and has much more the appearance of a village than of a town. The principal buildings are the monastery, the old palace (*Bigliardo*), the palaces of the prince and of the prince-royal, the hotel, the hospital, the reading-hall (*Čitaonica*), the women's institute, and the new military barracks. The old palace, a great quadrangular building, contains the ministries, the gymnasium, and the tribunal. The population of the whole hollow, including Cetinje, Bajce, Martinitché, Hum, and Donji Kraj, is about 1500.

Cetywayo, king of Zululand, was the son of King Umpanda. As early as 1856 he showed aspirations to the throne, which soon led to open war, and by victories over his father and brothers he virtually became king. By a compromise King Umpanda was made the "head" or adviser, with Cetywayo as the "feet" or administrator of the nation. The old king died in 1873, and Cetywayo was duly crowned in the presence of Mr (afterwards Sir) Theophilus Shepstone. The military power exercised by Cetywayo was, however, regarded by Sir Bartle Frere as a menace to Natal and the Transvaal, so he despatched an ultimatum to Cetywayo in December 1878, directing him to disband his formidable army, indemnify British subjects for outrages, and admit a British Resident. No reply being vouchsafed, Lord Chelmsford, at the head of 13,000 troops, entered Zululand on 11th January 1879. The disaster of Isandlana and the defence of Rorke's Drift signalized the commencement of the campaign, but on 4th July Cetywayo was utterly routed by Lord Chelmsford, and was captured by Major Marter on 28th August. Zululand was placed under a British Resident, and Cetywayo was taken to Cape Town, and afterwards to England, where he arrived 3rd August 1882. He remained in London until the following September, when the Government announced that they had decided upon his restoration, and sent him back to Africa. To his great disappointment, however, this proved to refer only to a portion of his old domains, the country north of the Umhlatusi river. Even here one of his chief enemies, Usibepu, was allowed to retain some territory allotted to him by Sir Garnet (afterwards Lord) Wolseley. Cetywayo's enemies, headed by Usibepu, soon attacked him, and after a struggle of nearly a year's duration he was defeated and his kraal destroyed. He then took refuge in the Native Reserve, where he died 8th February 1884. Cetywayo was a typical Zulu, brave and proud, but sunk in superstition and reckless of human life and human suffering.

(G. F. B.)

Ceuta, a Spanish station and seaport on the north coast of Morocco, nearly opposite Gibraltar, in 35° 54' N. lat., 5° 18' W. long. It is situated on a sort of promontory connected with the African mainland by a narrow isthmus. The population has steadily grown in the last forty years, outside the penal settlement and the garrison, which have also been increased. In 1897 there were 12,868 inhabitants, as compared with 10,600 in 1887. The garrison averages 3500 men, and the number of convicts ranges from 2000 to 2500. The garrison is under the command of a general of division, resident in the citadel of El Hacho, with military commandants in charge of the principal defences, exterior lines, forts Isabel II. and Prince Alphonso, and other outworks. The local militia is composed of a squadron of mounted rifles of Africa, a marine company, and sharpshooters of the Riff. There is also in Ceuta one of the three African infantry regiments, and the disciplinary

corps of military convicts styled "Fijo de Ceuta." The Spanish forces in the other stations at Melilla, Islas Chaffarinas, Peñon de la Gomera, Alhucemas on the north coast of Morocco, are under the orders of the commander-in-chief of Ceuta. In the 'nineties the governments of the Regency of Queen Christina were forced by public opinion to increase the garrison, fortifications, land and sea defences of Melilla. Little has been done, however, to improve the shallow harbour, much exposed to winds and gales that have often damaged its very imperfect moles and quays. The bay is commanded by the Mountain of the Marabout, a Moorish sepulchre better known as the Tomb of the Renegadi. Ceuta has only lately been better fortified seawards, and guns have been mounted in works that are intended to be troublesome for the highway of the seas into the Mediterranean. On the land side Ceuta is defended by three lines of fortifications, the first including only the antiquated citadel of El Hacho, between which and the third line stands the town proper, on the site of the ancient Sebta of the Arabs. On the north and west fronts of the peninsula the modern Ceuta rises in some sort in an amphitheatre. Beyond the third line of the fortification lies the neutral ground. The town has no striking public buildings: a modest cathedral of the 15th century, the town hall, barracks, a statue of Charles IV., and the convict prison in the old convent of San Francisco. Ceuta forms one of the judicial districts of the province of Cadiz, and is under the naval jurisdiction of Algeciras.

Ceylon, a large island and British colony, lying E. of the extreme southern point of India, with a greatest length from north to south of 271½ miles, a greatest breadth of 137½ miles, and an area of 25,363 miles, or somewhat less than four-fifths that of Ireland. Topographical, trigonometrical, cadastral, and archæological surveys have been placed upon a sound basis, but no geological survey, of which there is great need, has yet been definitely commenced.

Meteorology.—Notice should be directed to the wonderful immunity of Ceylon from cyclones, earthquakes, or other volcanic disturbances, and from destructive hurricanes. The latest tables of rainfall and temperature are as follows:—

Name of Station.	Altitude of Station. Feet.	Annual Rainfall in Inches.	Barometer (reduc. to 32° F.)		Mean Air Temperature.	Mean Daily Movement of Wind.	Number of Days on which Rain fell.	Greatest Rainfall in 24 Hours.
			Highest recorded.	Lowest recorded.

The above figures give the results of twenty-eight years' unbroken observations.

Flora and Fauna.—A great change has been effected in the appearance of the country by the introduction of the tea plant in place of the coffee plant, after the total failure of the latter owing to disease. Unlike the coffee plant, the hardy tea plant grows from sea-level to 7000 feet altitude; but Crown forest-lands above 5000 feet are no longer sold, so that a very large area on the highest mountain ranges and plateaux is still under forest. Moreover, on the tea plantations arboriculture is attended to in a way unknown in 1875; the Australian eucalypts, acacias, and grevilleas, Indian and Japanese conifers, and other trees of different lands, are now freely planted for ornament, protection

from wind, for firewood, or for timber. A great advance has been made at Hakgalla and Nuwara Eliya, in Upper Uva, and other high districts, in naturalizing English fruits and vegetables. The calamander-tree is nearly extinct, and ebony and other fine cabinet woods are getting scarce; but the conservation of forests after the Indian system has been taken in hand under a director and trained officers, and much good has been done. The cinnamon-tree (wild in the jungles, cultivated as a shrub in plantations) is almost the only one yielding a trade product which is indigenous to the island. The cocoa-nut and nearly all other palms have been introduced.

A Game Preservation Society and the judicious action of Government have done much to prevent the wanton destruction of Ceylon deer, elephants, &c., by establishing a close season. It is estimated that there must be 5000 wild elephants in the Ceylon forests. Since 1864, 2800 elephants have been exported (worth nominally, on the spot, £80,000), chiefly to India. A license to shoot or capture and an export royalty are now levied by Government. Capt. V. Legge includes 371 species of birds in Ceylon, of which only two have been introduced into the island. Insects and reptiles do not trouble European residents so much as in early years—at any rate in the towns, while in the higher planting districts there is almost complete exemption from their unwelcome attentions. Bungalows are more carefully built to resist white ants, drainage and cleanliness prevent mosquitoes and ticks from multiplying, while snakes and leeches avoid cultivated, occupied ground.

Population.—The total population of Ceylon in 1891 and 1901, distributed according to the nine provinces now existing, was as follows:—

	Area in sq. Miles.	Total Pop. 1891.	Total Pop. 1901.	Males, 1901.	Females, 1901.	Estate Pop. 1901.
Western . . .	1,432	764,828	925,212	493,864	431,348	26,815
Central . . .	2,300	474,670	622,832	339,060	283,772	285,096
Northern . . .	3,363	319,686	842,109	172,870	169,239	897
Southern . . .	2,146	490,074	566,690	288,812	277,878	8,508
Eastern . . .	4,037	149,786	174,156	91,122	83,034	592
North-Western . . .	2,997	320,070	353,708	195,777	157,926	9,726
North-Central . . .	4,002	75,383	79,101	48,278	30,823	
Uva . . .	3,155	150,201	191,925	106,081	85,844	51,798
Sabaragamuwa . . .	1,901	258,626	321,262	176,352	144,910	58,096
Total, Ceylon . . .	25,333 ¹	3,012,224	3,576,900 ²	1,907,161	1,669,829	441,523

¹ A more accurate survey now gives the total area as 25,363 square miles. The new provinces of Uva and Sabaragamuwa are almost entirely included in Kandyan territory.

² Including military, 3380; shipping, 4104; Boer prisoners of war, 4913.

³ Almost entirely immigrant coolies from Southern India.

The distribution as to race is as follows (1901):—

Sinhalese, including Kandyans . . .	2,334,817
Tamils . . .	952,237
"Moormen" (Mahommedans, chiefly Arab descendants) . . .	224,719
Malays . . .	11,207
Javanese, Kaffres, Afghans, Parsees, &c. . .	20,115
Veddahs . . .	1,000
Burghers and Eurasians . . .	23,312
Europeans, Americans, &c. . .	9,583

Altogether there are representatives of some seventy races in Ceylon. The Veddahs, who run wild in the woods, are the aborigines of the island. The population of Colombo, the commercial, social, and political capital, is now 158,093, inclusive of a floating population of about 4000.

Administration.—The legislative council now includes, besides the governor as president and the nine official members, eight unofficial members—one for the Kandyan Sinhalese (or Highlanders) and one for the "Moormen" having been added in 1890. The term of office for the unofficial members is limited to five years, though the governor may reappoint if he choose. The king's advocate, the deputy-advocate, and the surveyor-general are now respectively styled attorney-general, solicitor-general, and director of public works. The civil service has been reconstituted into five classes, not including the colonial secretary as a staff appointment, nor ten cadets; these five classes number seventy officers. The jurisdiction of the district and police courts was increased a few years ago. The district judges (numbering 19) can punish up to two years' imprisonment, and impose fines up to Rs.1000. The police magistrates (numbering 26) can pass sentences up to six months' imprisonment, and impose fines of Rs.150. The criminal law has since 1890 been codified on the model of the Indian penal code; criminal and civil procedure have also been the subject of codification. There are twenty-three prisons in the island, mostly small; but convict establishments in and near the capital take all long-sentence prisoners. The average annual number of prisoners is 2271, each costing about £15 per annum. The total outlay on prisons is Rs.4,50,000, or

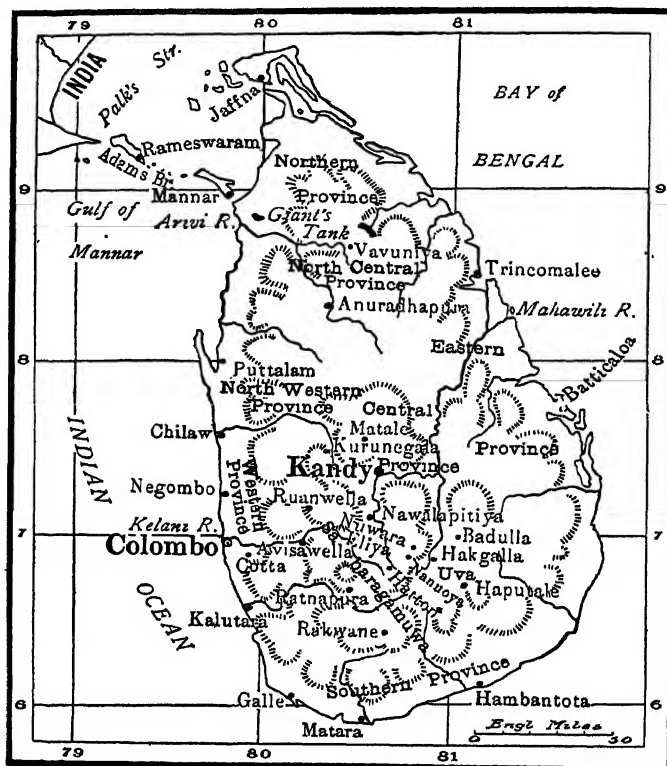

£30,000, a year. The police number 1700 men and officers, costing Rs.6,50,000, or £44,000, a year.

There are 65 hospitals and asylums (including lunatic and leper asylums and the Royal Victoria Home for Incurables), and 242 dispensaries. The Government Medical Department numbers 134 doctors and 227 apothecaries, and the whole establishment and administration cost annually about £80,000 net.

Religion.—The principal religions may be distributed as follows:—

Christians { Roman Catholics 280,000 } . . .	360,000
Protestants 80,000 . . .	
Buddhists	2,075,000
Hindus	900,000
Mahommedans	240,000

The anomaly of an ecclesiastical establishment of Anglican and Presbyterian chaplains with a bishop of Colombo paid out of the general revenues has been abolished in Ceylon, and only the bishop and two or three incumbents remain on the list for life, or till they retire on pension. Government has had to legislate for Buddhist temporalities, owing to the great corruption prevailing among priestly and lay trustees of temples; committees

B.V. Darbishire & O.J.R. Howarth.

SKETCH MAP OF CEYLON.

Oxford, 1901.

for each are now nominally appointed, but it is doubtful if they work satisfactorily. In the Kandyan district, the temples being endowed and the priests independent, the latter have generally neglected their duties of teaching the young boys and keeping up the zeal of the people. In the low country the priests, being dependent on voluntary offerings, have been generally zealous and active. Ignorance is greatest, as regards education, in the districts where Buddhism is strongest. Of late years there has been a revival of Buddhism in the towns and adjacent districts, and schools have been opened after Western models. There are about 10,000 Buddhist priests in Ceylon.

Education.—There has been a great advance in public instruction since 1875, through the multiplication of vernacular, Anglo-vernacular, and English schools by Government, by the different Christian missions, and by the Buddhists and Hindus who have come forward to claim the Government grant. The Government has also started a technical college, and an agricultural school has been reorganized. An agricultural department, recommended by a commission, should profit by the services of the entomologist, mycologist, and chemical analyst added by the governor to the staff of the Royal Botanic Gardens at Peradeniya. There are industrial and reformatory schools, which are partially supported by Government. In spite of the great advance that has been made, however, at the census of 1891 no fewer than 2,600,000 of the total population were entered as un-

able to read or write their own tongue, and the census of 1901 shows nearly two millions, out of a returned population of fully three and a half millions, still unable to read or write. The official returns (for 1898) show:—

500 Government schools	with 48,642 scholars
1328 Aided (chiefly mission) schools	„ 120,751 „
2089 Unaided schools	„ 38,881 „
Total, 3917 schools	„ 208,274 „

The total expenditure was Rs.8,20,184, or about £55,000.

Finance.—With the disease of the coffee plant the general revenue fell from Rs.1,70,00,000 in 1877 to Rs.1,20,00,000 in 1882, when trade was in a very depressed state, and the general prosperity of the island was seriously affected. Since then, however, the revenue has steadily risen with the growing export of tea, cocoa-nut produce, plumbago, &c., and in 1900 it reached the unprecedented amount of Rs.2,73,25,930 against an expenditure of Rs.2,53,21,988, the rupee being fixed at 15 to the £ sterling. The railway and customs make up between them 56 per cent. of the revenue; arrack monopoly yields Rs.25,00,000, there being about 1500 taverns, selling, with the stores, 1,000,000 gallons of arrack. The salt monopoly yields Rs.10,00,000; stamp duties, Rs.15,00,000; land sales, Rs.7,50,000. The one-sided import duty on grain, affecting about five-eighths of the people, is indefensible, since the “paddy” rent (the levy on rice locally grown) was abolished in 1892. In expenditure, public works and railways absorb one-fourth of the revenue; military expenditure, Rs.19,00,000; public debt charges, Rs.30,00,000 (the public debt is about Rs.5,60,00,000, or not much more than two years’ revenue); medical administration and hospitals, Rs.13,00,000; pensions, Rs.10,00,000; and the rest of the expenditure is absorbed by the various other branches of administration.

The Colombo municipality had a revenue for 1899 of Rs.10,88,520 against an expenditure of Rs.9,27,230. Kandy and Galle municipalities are much smaller, with revenues of about Rs.1,40,000 and Rs.80,000 respectively, and local boards established in fourteen minor towns raise about Rs.10,00,000 altogether.

Minerals.—Commercially there are two established industries: (1) that of digging for precious stones; and (2) the much more important industry of digging for plumbago or graphite, the one mineral of commercial importance found. Further developments may result in the shipment of the exceptionally pure iron ore found in different parts of Ceylon, though still no coal has been found to be utilized with it. Several places, too—Ruanwella, Rangalla, Rangbodde, &c.—indicate where gold was found in the time of the Kandyan kings; and geologists might possibly indicate a paying quartz reef, as in Mysore. Owing to the greatly increased demand in Europe and America, plumbago in 1899 more than doubled in price, rising from £40 to £80, and even £100 a ton for the finest. Latterly there has been a considerable fall, but the permanent demand is likely to continue keen in consequence mainly of the Ceylon kind being the best for making crucibles. One consequence of the plumbago boom has been to bring European and American capitalists and Cornish and Italian miners into a field hitherto almost entirely worked by Sinhalese. Though some of the mines were carried to a depth of 1000 feet, the work was generally very primitive in character, and Western methods of working are sure to lead to greater safety and economy. Besides a royalty or customs duty of 5 rupees (about 6s. 8d.) per ton on all plumbago exported, the Government issue licenses at moderate rates for the digging of plumbago on Crown lands, a certain share of the resulting mineral also going to Government. The plumbago industry, in all its departments of mining, carting, preparing, packing, and shipping, gives employment to fully 100,000 men and women, still almost entirely Sinhalese. The wealthiest mine-owners, too, are Sinhalese land-owners or merchants. The export has quadrupled since 1874, the increase latterly being especially rapid—from 24,000 tons in 1898 to nearly 31,000 tons in 1899, when 15,000 tons went to the United States, 9300 tons to the United Kingdom, and nearly 6000 tons to the continent of Europe. The local customs value placed on the total export was about Rs.1,00,00,000 (nearly £700,000), but in the Western markets it was much larger. The export of plumbago in 1900 was under 20,000 tons. In all there must be from 2500 to 3000 plumbago pits or mines in Ceylon; but many of these are abandoned or shut up, and perhaps not more than from one-third to one-half are worked even under the influence of recent high prices. The finest bright silvery lump plumbago still commands prices up to 800 rupees (nearly £54) per ton; while the lower qualities in the form of chips and dust can be got at one-sixth (or less) that rate.

As regards gems, there are perhaps 500 gem pits or quarries worked in the island during the dry season from November to June in the Ratnapura, Rakwane, and Matara districts. Some of these are on a small scale; but altogether several thousands of

Sinhalese find a precarious existence in digging for gems. Rich finds of a valuable ruby, sapphire, cat’s-eye, amethyst, alexandrite or star stone, are comparatively rare; it is only of the commoner gems, such as moonstone, garnet, spinels, that a steady supply is obtained. The cat’s-eye in its finer qualities is peculiar to Ceylon, and is occasionally in great demand, according to the fashion. The obstacle to the investment of European capital in “gemming” has always been the difficulty of preventing the native labourers in the pits—even if practically naked—from concealing and stealing gems. A Chamber of Mines, with a suitable library, was established in Colombo during 1899.

Agriculture.—The area of uncultivated land must exceed 20,000 of the 25,365 square miles in the island. Of course a great deal is waste, besides lagoons, tanks, backwaters, &c. Thick forest land does not cover more than 5000 square miles. Scrub, or chena, and patana grass cover a very great area. The following estimate of the cultivated area is taken from Ferguson’s *Ceylon Handbook and Directory* for 1901:—

	Acres cultivated.
Rice (paddy cultivation)	600,000
Other grain (kurakkan, Indian corn, pulses, and legumes)	120,000
Cocoa-nuts (European and native)	625,000
Areca nuts, Palmyra, and Kitul palms	135,000
Cinnamon	45,000
Cardamoms (European and native)	8,000
Other spices, nutmeg, clove, pepper, vanilla, ginger, &c.	10,000
Other palms and fruit-bearing trees and shrubs, jak, breadfruit, plantains, pines, oranges, mangoes, &c.	243,000
Garden vegetables, roots, yams, cassava, manioc, potatoes, cabbages, onions, chillies, cucumbers, &c.	100,000
Coffee (Arabica) European and native	7,700
Do. (Liberian) do.	2,500
Tea (European and native)	392,000
Chocolate plant (cacao) (European and native)	30,000
Cinchona	2,200
Sugar-cane	18,000
Cotton	1,000
Tobacco	25,000
Citronella grass and other essential oil grasses	40,000
Rhea, aloes, and other fibres	1,000
Rubber trees	2,800
Other new products	5,000
Blue gums and introduced timber trees	8,000
Cultivated grass land	15,000
Patana, natural pasturage, &c.	1,000,000
Total acres	3,434,000

Tea, cacao, cardamoms, cinchona, coffee, and indiarubber are the products cultivated by the European and an increasing number of native planters in the hill country and (for tea) part of the low country of Ceylon. It was owing to the failure of the coffee crops, as previously mentioned, that planters began extensively to grow the tea plant, which had already been known in the island for several years. By 1882 over 20,000 acres had been planted with tea, but the export that year was under 700,000 lb. Five years later the area planted was 170,000 acres, while the export had risen to nearly 14,000,000 lb. By 1892 there were 262,000 acres covered with tea, and 71,000,000 lb were that year exported. In 1897, 350,000 acres were planted, and the export was 116,000,000 lb. And in 1901 the total area cultivated with tea was not under 390,000 acres, while the estimate of shipments was put at 146,000,000 lb. The maximum area ever under coffee was 272,000 acres in 1877, when the total export of that product was equal to 103,000,000 lb. Now only a few thousand (perhaps 9000) acres of coffee are all that are left in Ceylon. From the first Ceylon tea found favour in the United Kingdom, Australia, and Canada, and its use is rapidly spreading throughout Europe and the United States. In 1900 the chief exports were to the United Kingdom, nearly 114,000,000 lb; to Australia, 17,600,000 lb; to Russia, nearly 9,000,000 lb; to America, 4,000,000 lb; and to China for America, 1,260,000 lb. Ceylon plantations of tea number in all about 1400, with as many European managers and assistants, giving employment to fully 400,000 Tamil men, women, and children. Nearly every plantation has its factory, with the machinery necessary to prepare the leaf as brought in from the bushes until it becomes the tea of commerce. The total amount of capital now invested in the tea industry in Ceylon cannot be less than £10,000,000 sterling. The tea-planting industry more than anything else has raised Ceylon from the very depressed state to which it fell in 1882. Before tea was proved a success, however, cinchona cultivation was found a useful bridge from coffee to the Ceylon planter, who, however, grew it so freely that in one year 15,000,000 lb bark was shipped, bringing the price of quinine down from 16s. to 1s. 6d. an ounce. Then the culture became

unprofitable, and in 1900 the export fell to 510,000 lb bark; but with higher prices there is likely to be a revival of the product in Ceylon. More important, however, among new planting products is *cacao* (the "chocolate plant"), the growth and export of which have steadily extended since coffee failed, so that in 1899 the export was 42,745 cwt. Important also is the spice or aromatic product of *cardamoms*, of which the annual export is now about 540,000 lb.

The culture of *indiarubber* has been begun on low-country plantations, and the industry is full of promise. The area of cultivation of the cocoa-nut palm has been greatly extended since 1875 by natives as well as by Europeans. The products of this palm that are exported, apart from those so extensively used in the island itself, exceed in a good year £1,000,000 sterling in value. The native trade in cinnamon has likewise greatly increased. The export of bales and chips increased from 2,335,961 lb in 1890 to 4,541,517 lb in 1900; of oil, from 108,787 oz. in 1890 to 118,778 oz. in 1899, when also over 800,000 lb of wild cinnamon were exported. Of citronella oil, 1,478,756 lb were exported in 1899 as compared with 909,942 lb in 1890, while of coir—rope, yarn, and fibre—the amount rose from just over 120,000 cwt. to close on 215,000 cwt. in 1900, the increase being almost entirely in the export of fibre. It is expected that viticulture, cotton cultivation, and tobacco growing, the last of which is already freely carried on in the north and north-east districts, will be greatly developed along the course of the new northern railway. A scheme for growing sugar in the north-east of the island on a large scale is now under consideration. In January 1892 the immemorial rent or tax on fields of *paddy* (rice in the husk) was removed, but not the customs duty on imported rice. But even with the advantage of "protection" to the extent of 10 per cent. in the local markets, there has been no extension of paddy cultivation; on the contrary, the import of grain from India grows larger year by year. In connexion with the liberal project of railway extension (see below), systematic expenditure on irrigation works, up to Rs.5,00,000 (to be included in the public loan for railways) is to be undertaken, and a separate irrigation department has been formed to secure full attention in prosecuting the selected undertakings. Among these will be the full restoration of the Giant's Tank in the arid Mannar district, around which possibly some of the surplus population of southern India may be settled to cultivate rice, cotton, and perhaps tobacco, besides other vegetables necessary to their subsistence. Through these multiplied irrigation works, also, and the northern railway, rice culture may be sufficiently extended to save some of the large imports (8,000,000 to 9,000,000 bushels annually) now required from India.

Taking the trade in the products mentioned as a whole, no country can compete with the United Kingdom as a customer of Ceylon. But there is a considerable trade in nearly all products with Germany and America; in cardamoms with India; in cinnamon with Spain, Italy, Belgium, Australia, Austria, and France; in some or other of the products of the cocoa-nut palm (cocoa-nuts, cocoa-nut oil, copra, desiccated cocoa-nut, poonac, coir) with Belgium, Russia, France, Austria, Australia, and Holland; and in plumbago with Belgium.

Pearl Fishery.—Since 1874 there have been ten years with more or less successful fisheries at Arippe, on the north-west coast, the latest and most successful being in 1891, when over £86,000 was gained by the Government. Seventeen years were blanks. Capt. Donnan, on his inspection in March 1901, reported a prospect of successful fisheries in 1904. Professor Herdman, F.R.S., was appointed to inquire and report on the conservation and cultivation of the Ceylon pearl-oyster, and visits Ceylon in January 1902.

Manufactures.—Little is done save in the preparation in factories and stores, in Colombo or on the plantations, of the several products exported. The manufacture of jewellery and preparation of precious stones, and, among native women and children, of pillow lace, give employment to several thousands. Iron and engineering works are numerous in Colombo and in the planting districts. The Sinhalese are skilful cabinetmakers and carpenters. The Moormen and Tamils furnish good masons and builders.

Commerce.—There has been rapid development since 1882, and the returns for 1900 showed a total value for imports (including specie) of 122 millions of rupees (say, £8,130,000). The principal items were: articles of food and drink (chiefly rice from India), over 3 millions sterling; manufactured metals (with specie), £1,000,000; coal, 590,000 tons; cotton yarns and piece goods from Manchester, about half a million sterling; machinery and mill-work, £160,000; apparel, &c., £150,000. The Ceylon customs tariff for imports is one of 6½ per cwt. *ad valorem*, save in the case of intoxicating drinks, arms, ammunition, opium, &c. The total value of the exports, including specie, for 1900 was 95 millions of rupees, or £6,400,000; tea was valued at nearly £3,500,000, and products of the cocoa-nut palm at £1,100,000. For 1900 the export trade was as follows:—

Exports to United Kingdom . . .	Rs. 5,62,95,525
„ „ British Colonies . . .	1,80,86,205
„ „ Foreign countries . . .	2,05,80,047

Rs. 9,49,62,277

i.e., goods to the value of nearly 4 millions sterling went to the United Kingdom out of a total export valued at £6,350,000 sterling.

Shipping and Navigation.—The headquarters of the mail steamers have been removed from Galle to Colombo, where a magnificent breakwater has been constructed and other harbour works have been undertaken. There has been a great increase in the number and tonnage of the vessels calling and coaling, as also a great development in the coasting trade. The total tonnage of vessels entered and cleared in 1900 was 8,316,191, of which 5,889,702 tons belonged to the United Kingdom, 207,026 tons to British colonies, and 2,219,463 tons to foreign countries.

Railways and Roads.—The railway system has developed from 100 to 297 miles in length, including one of the finest mountain lines in the world—over 160 miles long, rising to 6200 feet above sea-level, and falling at the present terminus to 4000 feet. The towns of Kandy, Matale, Gampola, Nawalapitiya, Hatton, and Haputale (and practically Nuwara Eliya) in the hills, are thus connected by rail, and in the low country the towns of Kurunegala, Galle, Matara, Kalutara, &c. These 297 miles (all Government) cost about 53 millions of rupees, but most of the debt is paid off, and the traffic receipts now make up nearly one-third of the general revenue. At present 200 miles more of railway are under construction (all on the same wide 5½-foot gauge) to connect Jaffna and the north with the rest of the island. This northern line will run from Kurunegala *via* Anuradhapura, "the buried city" and earliest capital of the Sinhalese, through the centre of the island and across the Jaffna peninsula. Two lines on a narrow (2½-foot) gauge are also under construction—(1) to connect Colombo through Cotta—also an early royal Sinhalese seat—with Avisawella and the Kelani valley tea-growing district, 45 miles; and (2) to connect Nanuoya, on the main line, with the sanatorium (Nuwara Eliya) and on to Udapussilava, over 20 miles. Other hill lines will follow, and also, probably, a prolongation of the Kelani railway through Colombo and northwards to the towns of Negombo, Chilaw, and Puttalam, serving one of the richest and most populous of native districts. The 270 additional miles actually sanctioned and under construction will cost over 15 millions of rupees. An Indo-Ceylon railway to connect the Indian and Ceylon systems has been the subject of separate reports and estimates by engineers serving the Ceylon and Indian Governments, who have pronounced the work across the coral reef between Mannar and Rameswaram quite feasible. Such a line is sure to be made for strategic as well as commercial purposes, and Colombo will then be more than ever the port for Southern India. Ceylon has now about 3800 miles of high roads, mostly macadamized, and the maintenance of these costs annually Rs.15,00,000 (or £100,000). There are besides perhaps 10,000 miles of minor—estate and village—roads.

Banks and Currency.—Ceylon has agencies of the National Bank of India, Bank of Madras, Mercantile Bank of India, Chartered Bank of India, Australia, and China, and of the Hongkong and Shanghai Bank, besides mercantile agencies of other banks. Also a Government Savings Bank at Colombo and Post Office Savings Banks all over the island. In 1884, on the failure of the Oriental Bank, the notes in currency were guaranteed by Government, and a Government note currency was started in supersession of bank notes. This note currency has now reached an average of 12 millions of rupees, giving an annual income to Government exceeding Rs.2,00,000. The banks' clearing-house returns for Colombo show nearly 200 million rupees of cheques per annum. The Savings Bank shows nearly 2 millions of rupees lodged from 13,000 depositors, besides small deposits in post office, and several provident funds. The coin currency of Ceylon is in rupees and decimals of a rupee, the value of the standard following that fixed for the Indian rupee, about 1s. 4d. per rupee. Of specie in 1900 the value imported was Rs.77,95,502; exported, Rs.29,19,796.

Chabrier, Alexis Emmanuel (1841-1894), French composer, was born at Ambert on 18th January 1841. At first he only cultivated music as an amateur, and it was not until 1879 that he threw up an administrative appointment in order to devote himself entirely to the art. He had two years previously written an *opéra bouffe* entitled *L'Étoile*, which was performed at the Bouffes Parisiens. In 1881 he was appointed chorus-master of the concerts then recently established by Lamoureux. Two years later he composed the brilliant orchestral rhapsody entitled *España*, the themes of which he had jotted down when travelling in Spain. His opera *Gwendoline* was brought out at Brussels on 10th April 1886, with considerable success, and was given later at the Paris Grand Opéra. The following year 1887, *Le Roi malgré lui*, an opera of a lighter description, was produced in Paris at the Opéra Comique, its run being interrupted by the terrible fire by which this theatre was destroyed. His last opera, *Briseis*, was left unfinished, and performed in a fragmentary condition at the Paris Opéra, after the composer's death in Paris on the 13th September 1894. Chabrier was also the author of a set of piano pieces entitled *Pièces Pittoresques, Valses Romantiques*, for two pianos, a fantasia for horn and piano, &c. His musical tendencies were very modern, and his great admiration for Wagner asserted itself in *Gwendoline*, a work which, in spite of inequalities due to want of experience, is animated by a high artistic ideal, is poetically conceived, and evinces considerable harmonic originality, besides a thorough mastery over the treatment of the orchestra. The characteristics of *Le Roi malgré lui* have been well summed up by M. Joncières when he alludes to "cette verve inépuisable, ces rythmes endiablés, cette exubérance de gaieté et de vigueur, à laquelle venait se joindre la note mélancolique et émue." Chabrier's premature death prevented him from giving the full measure of his worth. (A. H.E.)

Chaco, a territory in the north of the Argentine Republic, bounded on the N. by the territory of Formosa, from which it is separated by the Río Bermejo, on the S. by Santiago del Estero and Santa Fé, on the E. by Paraguay and Corrientes, and on the W. by Santiago del Estero and Salta. The official area at the census of 1895 comprised 52,741 square miles, with a population of 10,422. It is divided into five departments. The capital, Resistencia, on the Paraná, has a population of 3000. In 1895 the territory had 620 farms—11,214 acres planted in cereals, 83,952 head of cattle, 7671 head of sheep, and 5408 horses.

Chad, a large lake of northern Central Africa, of very variable extent, generally shallow, and containing many islands. It is fed principally by the Shari, coming from the south-east, but in the rains a considerable body of water is brought down by the Waube from the west. The lake has no proper outlet, but at high water the surplus floods the swampy valley of the Bahr-el-Ghazal on the south-east; it does not, if recent accounts are to be trusted, reach the depression to the north-east known as Bodele, as was supposed by Nachtigal. In 1897 the southern part of the lake was for the first time navigated by a steamer, which had been brought from the south and launched on the Shari by the French expedition under Gentil. Lake Chad lies on the borderland between the wooded regions of the Sudan on the south and the arid steppes which merge into the Sahara on the north. Its shores are generally devoid of trees. The native sultanates of Bornu (south and west of the lake) and Wadai and

Kanem (east and north) have by international agreements fallen to the spheres of Great Britain, France, and Germany, the partition taking no account of former boundaries. European influence had, before 1900, scarcely reached the lake, but the power of Rabah, usurping sultan of Bornu, was in that year finally broken by his defeat by the French. One of the long-established trade routes across the Sahara—that from Tripoli to Kuka in Bornu—strikes the lake at its north-west corner, but this has lost much of its former importance. Communication from Algeria to the lake *via* Air was, after repeated failures, opened by M. Foureau in 1899-1900, while Lieut. Joalland, member of the expedition originally entrusted to Capt. Voulet and Chanoine, also reached the lake from the Middle Niger, continuing his journey round the north end to Kanem.

See FOUREAU, in *Geographical Journal*, February 1901; JOALLAND, in *La Géographie*, June 1901.

Chadwick, Sir Edwin (1800-1890), was born at Longsight, near Manchester, in 1800. Called to the bar without any independent means, he sought to support himself by literary work, and his essays in the *Westminster Review* (mainly on different methods of applying scientific knowledge to the business of government) introduced him to the notice of Jeremy Bentham, who engaged him as a literary assistant and left him a handsome legacy. In 1832 he was employed by the Royal Commission appointed to inquire into the operation of the poor laws, and in 1833 he was made a full member of that body. In conjunction with Nassau Senior he drafted the celebrated report of 1834 which procured the reform of the old poor law. His special contribution was the institution of the union as the area of administration. He favoured, however, a much more centralized system of administration than was adopted, and he never ceased to complain that the reform of 1834 was fatally marred by the rejection of his views, which contemplated the management of poor-law relief by salaried officers controlled from a central board, the boards of guardians acting merely as inspectors. In 1834 he was appointed secretary to the Poor Law Commissioners. Finding himself unable to administer in accordance with his own views an Act of which he was largely the author, his relations with his official chiefs became much strained, and the disagreement led, among other causes, to the dissolution of the Poor Law Commission in 1846. Chadwick's chief contribution to political controversy was his constant advocacy of entrusting certain departments of local affairs to trained and selected experts, instead of to representatives elected on the principle of local self-government. While still officially connected with the poor law he had taken up the question of sanitation in conjunction with Dr Southwood Smith, and their joint labours produced a most salutary improvement in the public health. His report on "The Sanitary Condition of the Labouring Population" (1842) is a valuable historical document. He was a commissioner of the Board of Health from its establishment in 1848 to its abolition in 1854, when he retired upon a pension, and occupied the remainder of his life in voluntary contributions to sanitary and economical questions. He died on 6th July 1890. He had been made K.C.B. in 1889. The best account of his opinions is *The Health of Nations* (1887), which is practically a biography dictated by himself to the late Sir B. W. Richardson.

See also a volume on *The Evils of Disunity in Central and Local Administration . . . and the New Centralisation for the People*, by Edwin Chadwick (1885).

Chaffarinas, a Spanish station in a group of islands of the same name, on the north coast of Morocco, near the Algerian frontier, $2\frac{1}{2}$ miles to the north of Cape del Agna. The largest of these isles, Del Congreso, is

rocky and hilly. It has a watch-house on the coast nearest to Morocco. The island of Isabella II. contains several batteries, barracks, and a penal convict settlement. For years the Spanish Government has been preparing works, breakwaters to unite this island with that of El Rey, with a view to enclose a deep and already sheltered anchorage. This roadstead even now can afford a safe refuge for 40 large vessels and many of light draught. The Chaffarinas, which are the *Presinsulæ* of the Romans and the *Zaferin* of the Arabs, were occupied by Spain in 1848. The population was 596 in 1897, including troops.

Chagos, a group of atolls in the Indian Ocean disposed in circular form round the Chagos bank, in 5° 30' to 6° 30' N. and 71° 30' to 72° 30' E., separated from the Maldives by a deep channel 300 miles wide. The atolls on the south and east side of the bank, which has a circumference of about 270 miles, have disappeared through subsidence; a few—Egmont, Danger, Eagle, and Three Brothers—still remain on the east side, but most of the population (700 in 1900) is centred on Diego Garcia, which lies on the south-east side, and is nearly 13 miles long by 6 wide. The lagoon, which is enclosed by two coral barriers and accessible to the largest vessels on the north side, forms one of the finest harbours in the world, and affords every facility for establishing repairing docks, victualling and coaling stations. The group, which has a total land area of 76 square miles, is dependent for administrative purposes on Mauritius, and is regularly visited by vessels from that colony. The only product is cocoa-nut oil, of which about 4800 hectolitres are annually exported. Since 1791 this industry has been in the hands of French Creoles from Mauritius.

Chaidam. See TSAIDAM.

Chalcedon, now KADIKÖY, on the shore of the Bosphorus, south of Scutari. Kadiköy forms the tenth "Cercle" of the municipality of Constantinople, and has a population of about 33,000, of whom 8000 are Moslems. There are a large British colony with a church, Greek and Armenian churches and schools, and a training college for Roman Catholic Armenians.

ChallemeL-Lacour, Paul Amand (1827-1896), French statesman, was born at Avranches on 19th May 1827. After passing through the *École normale supérieure*, he became professor of philosophy successively at Pau and at Limoges. The *coup d'état* of 1851 caused his expulsion from France for his republican opinions. He travelled on the Continent, and in 1856 settled down as professor of French literature at the Polytechnic of Zürich. The amnesty of 1859 enabled him to return to France, but a projected course of lectures was immediately suppressed. He now supported himself by his pen, and became a regular contributor to the reviews. On the fall of the second empire in 1870 the Government of National Defence appointed him prefect of the department of the Rhone, in which capacity he had to suppress the Communist rising at Lyons. Resigning his post in the following year, he was in 1872 elected to the National Assembly, and in 1876 to the Senate. He sat at first on the Extreme Left; but his philosophic and critical temperament was not in harmony with the recklessness of French Radicalism, and his attitude towards political questions underwent a steady modification, till the close of his life saw him the foremost representative of moderate republicanism. During Gambetta's lifetime, however, ChallemeL-Lacour was one of his warmest supporters, and he was for a time editor of Gambetta's organ, the *République Française*. In 1879 he was appointed French ambassador at Berne, and in 1880 was transferred to

London; but he lacked the suppleness and command of temper necessary to a successful diplomatist. He resigned in 1882, and in February 1883 became minister of foreign affairs in the Jules Ferry Cabinet, but retired in November of the same year. In 1890 he was elected vice-president of the Senate, and in 1893 succeeded Jules Ferry as its president. His influence over that body was largely due to his clear and reasoned eloquence, which placed him at the head of contemporary French orators. In 1893 he also became a member of the French Academy. He distinguished himself by the vigour with which he upheld the Senate against the encroachments of the Chamber, but in 1895 failing health forced him to resign, and he died in Paris on 26th October 1896. He published a translation of Ritter's *History of Philosophy* (1861); *La philosophie individualiste: étude sur Guillaume de Humboldt* (1864); and an edition of the works of Madame d'Épinay (1869). In 1897 appeared *Œuvres oratoires de ChallemeL-Lacour* . . . avec une introduction et des notices par Joseph Reinach. (H. S.)

Châlon-sur-Saône, chief town of arrondissement, department of Saône-et-Loire, France, 46 miles N. of Macon, on railway from Paris to Lyon. It has manufactures of machinery, vinegar, oil-refining, and iron and copper founding. In the square opposite the Palais de Justice is a fountain erected in memory of the Thévenin family, to whom the town is indebted for its water-supply. The ancient hospital in the St Laurent suburb has been rebuilt. Population (1881), 19,864; (1901), 29,058.

Châlons-sur-Marne, chief town of department Marne, France, 107 miles E. of Paris by rail. The town has become a great centre for the manufacture of beer, in part replacing that of wine. One of the large breweries occupies a series of galleries in the limestone rock originally excavated for the storage of wine. These galleries, with a total length of 6 miles, are now served by lines of railway which convey the beer directly to the station. The woollen industry has declined. Châlons is the headquarters of the 6th army corps. The port traffic on the Marne canal in 1899 was 47,374 tons. Population (1881), 17,298; (1901), 21,487.

Chamba, a native state of India, within the Punjab, amid the Himalayas. It has an area of 3126 square miles. In 1881 the population was 115,773; in 1891 it was 124,032, giving an average density of 40 persons per square mile; and in 1901 it was 128,005. The estimated gross revenue is Rs.3,50,000; the tribute, Rs.5000; the military force, 400. The sanitarium of Dalhousie, though within the state, is attached to the district of Gurdaspur.

Chamberlain, Joseph, (1836—), British statesman, third son of Joseph Chamberlain, Master of the Cordwainers' Company, was born at Camberwell Grove, London, on 8th July 1836. His father was a well-to-do man of business, a Unitarian in religion and a Liberal in politics. Young Chamberlain was educated at Canonbury from 1845 to 1850, and at University College School, London, from 1850 to 1852. After two years in his father's office in London, he was sent to Birmingham to join his cousin Joseph Nettlefold in a screw business in which his father had an interest; and by degrees, largely owing to his own intelligent management, this business became very successful. "Nettlefold and Chamberlain" employed new methods of attracting customers, and judiciously amalgamated rival firms with their own so as to reduce competition, with the result that in 1874, after twenty-two years of commercial life, Mr Chamberlain was able to retire with an ample fortune. Meanwhile he had in 1861 married his first wife, Miss Harriet Kenrick (she died

in 1863), and had gradually come to take an increasingly important part in the municipal and political life of Birmingham. He was a constant speaker at the Birmingham and Edgbaston Debating Society; and when in 1868 the Birmingham Liberal Association was reorganized, he became one of its leading members. In 1869 he was elected chairman of the executive council of the new National Education League, the outcome of Mr George Dixon's movement for promoting the education of the children of the lower classes by paying their school fees and agitating for more accommodation and a better national system. In the same year he was elected a member of the town council, and married his second wife,—a cousin of his first,—Miss Florence Kenrick (d. 1875).

In 1870 he was elected a member of the first School Board for Birmingham; and for the next six years, and

JOSEPH CHAMBERLAIN.

(From a photograph by Russell and Sons, London.)

especially after 1873, when he became leader of a majority and chairman, he actively championed the Nonconformist opposition to denominationalism. He was then regarded as a Republican—the term signifying rather that he held advanced Radical opinions, which were construed by average men in the light of the current political developments in France, than that he really favoured Republican institutions. His programme was “free Church, free land, free schools, free labour.” At the general election of 1874 he stood as a parliamentary candidate for Sheffield, but without success. Between 1869 and 1873 he was a prominent advocate in the Birmingham town council of the gospel of municipal reform preached by Mr Dawson, Dr Dale, and Mr Bunce (of the *Birmingham Post*); and in 1873 his party obtained a majority, and he was elected mayor, an office he retained until June 1876. As mayor he had to receive the Prince and Princess of Wales on their visit in June 1874, an occasion which excited some curiosity because of his reputation as a Republican; but those who looked for an exhibition of bad taste were disappointed, and the behaviour of the Radical mayor satisfied the requirements alike of the *Times* and of *Punch*.

The period of his mayoralty was one of historic importance for Birmingham. New municipal buildings were erected, Highgate Park was opened as a place of recreation, the Free Library and Art Gallery were developed. But the great work carried through by Mr Chamberlain for Birmingham was the municipalization of the supply of gas and water, and the improvement scheme by which slums were cleared away and forty acres laid out in new streets and open spaces. The prosperity of modern Birmingham dates from 1875 and 1876, when these admirably administered reforms were initiated, and by his share in them Mr Chamberlain became famous. It may be added here that the interest taken by him in Birmingham remained undiminished during his later life, and he was largely instrumental in starting the Birmingham University (1900).

In 1876 Mr Dixon resigned his seat in Parliament, and Mr Chamberlain was returned for Birmingham in his place unopposed, as John Bright's colleague. He made his maiden speech in the House of Commons on 4th August 1876, on Lord Sandon's Education Bill. At this period, too, he paid much attention to the question of licensing reform, and in 1876 he examined the Gothenburg system in Sweden, and advocated a solution of the problem in England on similar lines. During 1877 the new federation of Liberal Associations which became known as the “Caucus,” was started under Mr Chamberlain's influence in Birmingham,—its secretary, Mr Schnadhorst, quickly making himself felt as a wire-puller of exceptional ability; and the new organization had a remarkable effect in putting life into the Liberal party, which since Mr Gladstone's retirement in 1874 had been much in need of a stimulus. When the general election came in 1880 Mr Schnadhorst's powers were demonstrated in the successes won under his auspices. The Liberal party numbered 349, against 243 Conservatives and 60 Irish Nationalists; and the Radical section of the Liberal party, led by Mr Chamberlain and Sir Charles Dilke, was recognized by Mr Gladstone by his inclusion of the former in his Cabinet as President of the Board of Trade, and the appointment of the latter as Under Secretary for War. In his new capacity Mr Chamberlain was responsible for carrying such important measures as the Bankruptcy Act, 1887, and the Patents Act. Another Bill which he had much at heart, on Merchant Shipping, had to be abandoned, and a royal commission substituted, but the subsequent legislation in 1888-94 owed much to his efforts. The Franchise Act of 1884 was also one in which he took a leading part as a champion of the opinions of the labouring class. At this time he took the current advanced Radical views of both Irish and foreign policy, hating coercion, disliking the occupation of Egypt, and prominently defending the Transvaal settlement after Majuba. Both before and after the defeat of Mr Gladstone's Government on the Budget in June 1885, he associated himself with what was known as the “Unauthorized Programme,” i.e., free education, small holdings, graduated taxation, and local government. In June 1885 he made a speech at Birmingham, treating the reforms just mentioned as the “ransom” that property must pay to society for the security it enjoys—for which Lord Iddesleigh called him “Jack Cade”; and he continually urged the Liberal party to take up these Radical measures. At the general election of November 1885 Mr Chamberlain was returned for West Birmingham. The Liberal strength generally was, however, reduced to 335 members, though the Radical section held their own; and the Irish vote became necessary to Mr Gladstone if he was to command a majority. In December it was stated that Mr Gladstone intended to propose a Home Rule Bill, and in January Lord Salisbury's ministry was defeated on the Address, on an amendment moved by Mr Jesse Collings embodying

the "three acres and a cow" of the Radical programme. Unlike Lord Hartington and other Liberals, who declined to join Mr Gladstone in view of the altered attitude he was adopting towards Ireland, Mr Chamberlain entered the Cabinet as President of the Local Government Board, but on 15th March 1886 he resigned, explaining in the House of Commons (8th April) that, while he had always been in favour of the largest possible extension of local government to Ireland consistently with the integrity of the empire and the supremacy of Parliament, and had therefore joined Mr Gladstone when he believed that this was what was intended, he was unable to consider that the scheme communicated by Mr Gladstone to his colleagues maintained those limitations. At the same time he was not irreconcilable, and he invited Mr Gladstone even then to modify his Bill so as to remove the objections made to it. This indecisive attitude did not last long, and the split in the party rapidly widened. At Birmingham Mr Chamberlain was supported by the "Two Thousand," but deserted by the "Caucus" and Mr Schnadhorst. In May the Radicals who followed Mr Bright and Mr Chamberlain, and the Whigs who took their cue from Lord Hartington, decided to vote against the second reading of the Home Rule Bill, instead of allowing it to be taken and then pressing for modifications in committee, and on 7th June the Bill was defeated by 343 to 313, 94 Liberal Unionists—as they were generally called—voting against the Government. Mr Chamberlain was the object of the bitterest attacks from the Gladstonians for his share in this result; he was stigmatized as "Judas," and open war was proclaimed by the Home Rulers against the "dissentient Liberals"—the description used by Mr Gladstone. The general election, however, returned to Parliament 316 Conservatives, 78 Liberal Unionists, and only 276 Gladstonians and Nationalists, Birmingham returning seven Unionist members. When the House met in August, it was decided by the Liberal Unionists, under Lord Hartington's leadership, that their policy henceforth was essentially to combine with the Tories to keep Mr Gladstone out. The old Liberal feeling still prevailing among them was too strong, however, for their leaders to take office in a coalition ministry. It was enough for them to be able to tie down the Conservative Government to such measures as were not offensive to Liberal Unionist principles. It still seemed possible, moreover, that the Gladstonians might be brought to modify their Home Rule proposals, and in January 1887 a Round Table conference (suggested by Mr Chamberlain) was held between Mr Chamberlain, Sir G. Trevelyan, Sir William Harcourt, Mr Morley, and Lord Herschell. But no *rapprochement* was effected, and reconciliation became daily more and more difficult. The influence of Liberal Unionist views upon the domestic legislation of the Government was steadily bringing about a more complete union in the Unionist party, and destroying the old lines of political cleavage. Before 1892 Mr Chamberlain had the satisfaction of seeing Lord Salisbury's ministry pass such important Acts, from a progressive point of view, as those dealing with Coal Mines Regulation, Allotments, County Councils, Housing of the Working Classes, Free Education, and Agricultural Holdings, besides Irish legislation like the Ashbourne Act, the Land Act of 1891, and the Light Railways and Congested Districts Acts. In October 1887 Mr Chamberlain, Sir L. Sackville West, and Sir Charles Tupper were selected by the Government as British plenipotentiaries to discuss with the United States the Canadian fisheries dispute, and a treaty was arranged by them at Washington on 15th February 1888. The Senate refused to ratify it; but a protocol provided for a *modus vivendi* pending ratification, giving American fishing vessels similar advan-

tages to those contemplated in the treaty; and on the whole Mr Chamberlain's mission to America was accepted as a successful one in maintaining satisfactory relations with the United States. He returned to England in March 1888, and was presented with the freedom of the borough of Birmingham. The visit also resulted, in November 1888, in his marriage with his third wife, Miss Endicott, daughter of the United States minister of war in President Cleveland's first administration.

At the general election of 1892 Mr Chamberlain was again returned, with an increased majority, for West Birmingham; but the Unionist party as a whole came back with only 315 members against 355 Home Rulers. In August Lord Salisbury's ministry was defeated; and on 13th February 1893 Mr Gladstone introduced his second Home Rule Bill, which was eventually read a third time on 1st September. During the eighty-two days' discussion in the House of Commons Mr Chamberlain was the life and soul of the opposition, and his criticisms had a vital influence upon the attitude of the country when the House of Lords summarily threw out the Bill. His chief contribution to the discussions during the later stages of the Gladstone and Rosebery ministries was in connexion with Mr Asquith's abortive Employers' Liability Bill, when he foreshadowed the method of dealing with this question afterwards carried out in the Compensation Act of 1897. Outside Parliament he was busy formulating proposals for Old Age Pensions, which had a prominent place in the Unionist programme of 1895. In that year, on the defeat of Lord Rosebery, the union of the Unionists was sealed by the inclusion of the Liberal Unionist leaders in Lord Salisbury's ministry; and Mr Chamberlain became Secretary of State for the Colonies. There had been much speculation as to what his post would be, and his nomination to the Colonial Office, then considered one of secondary rank, excited some surprise; but Mr Chamberlain himself realized how important that department had become. His influence in the Unionist Cabinet was soon visible in the Workmen's Compensation Act and other measures. This Act, though in Sir Matthew White Ridley's charge as Home Secretary, was universally and rightly associated with Mr Chamberlain; and its passage, in the face of much interested opposition from highly-placed old-fashioned Conservatives and capitalists on both sides, was principally due to his determined advocacy. Another "social" measure of less importance, which formed part of the Chamberlain programme, was the Small Houses Acquisition Act of 1899; but the problem of Old Age Pensions was less easily solved, and the subject was handed over first to a royal commission, and then to a departmental committee, both of which threw cold water on the schemes laid before them—a result which, galling enough to one who had made so much play with the question in the country, offered welcome material to his opponents for electioneering recrimination, as year by year went by between 1895 and 1900 and nothing resulted from all the confident talk on the subject in which Mr Chamberlain had indulged when out of office.

From January 1896 (the date of the Jameson Raid) onwards South Africa demanded the chief attention of the Colonial Secretary. It is too soon to estimate precisely the part played by Mr Chamberlain in the affairs which at last led to war with the Transvaal. But never has a statesman's personality been more bitterly associated by his political opponents with the developments they deplored. The report of the House of Commons committee (July 1897) definitely acquitted both Mr Chamberlain and the Colonial Office of any privy in the Raid, but Mr Chamberlain's detractors continued to assert the contrary. Opposition hostility reached such a pitch that in 1899

there was hardly an act of the Cabinet during the negotiations with President Kruger which was not attributed to the personal malignity and unscrupulousness of the Colonial Secretary. The elections of 1900 (when he was again returned, unopposed, for West Birmingham) turned upon the individuality of a single minister more than any since the days of Mr Gladstone's ascendancy, and Mr Chamberlain, never conspicuous for inclination to turn his other cheek to the smiter, was not slow to return the blows with interest.

Apart from South Africa, his most important work was the successful passing of the Australian Commonwealth Act (1900), in which both tact and firmness were needed to settle certain differences between the Imperial Government and the colonial delegates. Mr Chamberlain's tenure of the office of Colonial Secretary between 1895 and 1900 must always be regarded as a turning-point in the history of the relations between the British Colonies and the Mother Country. His accession to office was marked by speeches breathing a new spirit of imperial consolidation, embodied either in suggestions for commercial union, or in more immediately practicable proposals for improving the "imperial estate"; and at the Diamond Jubilee of 1897 the visits of the colonial Premiers to London emphasized and confirmed the new policy, the fruits of which were afterwards seen in the cordial support given by the colonies in the Boer war. Even in what Mr Chamberlain called his "Radical days" he had never supported the "Manchester" view of the value of a colonial empire; and during the Gladstone ministry of 1880-85 Mr Bright had remarked that the junior member for Birmingham was the only Jingo in the Cabinet—meaning, no doubt, that he objected to the policy of *laissez-faire* and the timidity of what was afterwards known as "Little Englandism." While he was still under Mr Gladstone's influence these opinions were kept in subordination, but Mr Chamberlain was always an imperial federationist, and from 1887 onwards he constantly gave expression to his views on the desirability of drawing the different parts of the empire closer together for purposes of defence and commerce. In 1895 the time for the realization of these views had come; and Mr Chamberlain's speeches, previously remarkable chiefly for debating power and directness of argument, were now dominated by a new note of constructive statesmanship, basing itself on the economic necessities of a world-wide empire. Not the least of the anxieties of the Colonial Office during this period was the situation in the West Indies, where the cane-sugar industry was being steadily undermined by the European bounties given to exports of Continental beet; and though the Government restricted themselves to attempts at removing the bounties by negotiation and to measures for palliating the worst effects in the West Indies, Mr Chamberlain made no secret of his repudiation of the Cobden Club view that retaliation would be contrary to the doctrines of free trade, and he did his utmost to educate public opinion at home into understanding that the responsibilities of the Mother Country are not merely to be construed according to the selfish interests of a nation of consumers. As regards foreign affairs, Mr Chamberlain more than once (and particularly at Leicester on 30th November 1899) indicated his leanings towards a closer understanding between the British Empire, the United States, and Germany,—a suggestion which did not save him from an extravagant outburst of German hostility during the Boer war. The unusually outspoken and pointed expression, however, of his disinclination to submit to Muscovite duplicity or to "pin-pricks" or "unmannerliness" from France, was criticized on the score of discretion by a wider circle than that of his political adversaries.

Mr Chamberlain is popularly known as indulging a hobby for orchid-growing at his house, "Highbury," near Birmingham. An orator of a straightforward, unrheterical type, cool, alert in debate, and hard-hitting, his personality has always had a peculiarly irritating effect on his opponents; and his spare figure, incisive features, and single eyeglass have made him a favourite subject for the caricaturist. Among other public honours, he was made Lord Rector of Glasgow University in 1897, and delivered on that occasion an address on "Patriotism." His eldest son, Austen, has also made his mark in politics as a Civil Lord of the Admiralty, 1895-1900, and as financial secretary to the Treasury (1901).

Chamberlain, Sir Neville Bowles (1820-1902), British field-marshal (1900), third son of Sir Henry Chamberlain, first baronet, consul-general and chargé d'affaires in Brazil, was born at Rio on the 10th January 1820. He entered the Indian army in 1837, served as a subaltern in the first Afghan war (1839-42), and was wounded on six occasions (medal and clasps). He was attached to the Governor-General's bodyguard at the battle of Maharajpur, in the Gwalior campaign of 1843 (medal), was appointed military secretary to the governor of Bombay in 1846, and honorary aide-de-camp to the Governor-General of India in 1847. He served on the staff throughout the Punjab campaign of 1848-49 (medal and clasps and brevet majority). In 1850 he was appointed commandant of the Punjab military police, and in 1852 military secretary to the Punjab Government. Promoted lieutenant-colonel in 1854, he was given the command of the Punjab Frontier Force with rank of brigadier-general, and commanded in several expeditions against the frontier tribes. In the Indian Mutiny he succeeded Colonel Chester as adjutant-general of the Indian army, and distinguished himself at the siege of Delhi, where he was severely wounded (medal, brevet-colonelcy, A.D.C. to the Queen, and C.B.). He was reappointed to the command of the Punjab Frontier Force in 1858, and commanded in the (1863) Umbeyla campaign, when he was severely wounded (medal, major-general for distinguished service, and K.C.B.). He was made K.C.S.I. in 1866, lieutenant-general in 1872, G.C.S.I. in 1873, G.C.B. in 1875, and general in 1877. From 1876 to 1881 he was commander-in-chief of the Madras army, and in 1878 was sent on a mission to the Amir of Afghanistan, whose refusal to allow him to enter the country precipitated the second Afghan war. He was for some time acting military member of the Council of the Governor-General of India. He retired in 1886, and died 18th February 1902.

Chambers, William (1800-1883). The story of the brothers Chambers has been so fully told in the *Ency. Brit.* (vol. v.), that it is only necessary to add that William Chambers (born at Peebles, 16th April 1800) was the financial genius of the firm, and that, although possessing neither the literary abilities nor the attractive character of his brother, he laid the city of Edinburgh under the greatest obligations by his public spirit and munificence. As Lord Provost he procured the passing in 1867 of the Improvement Act, which led to the reconstruction of a great part of the Old Town, and at a later date he proposed and carried out, largely at his own expense, the restoration of the noble and then neglected church of St Giles, making it in a sense "the Westminster Abbey of Scotland." This service was fitly acknowledged by the offer of a baronetcy, which he did not live to receive, dying on 20th May 1883, three days before the reopening of the church. He was the author of a history of St Giles's, of a memoir of himself and his brother, and of many other useful publications.

Chambersburg, a borough of Pennsylvania, U.S.A., and capital of Franklin county, situated in the

Cumberland Valley, in the southern part of the state, at an altitude of 613 feet. It has three railways, the Cumberland Valley, the Western Maryland, and the Mont Alto. Population (1880), 6877; (1890), 7863; (1900), 8864, of whom 769 were negroes.

Chambon, Le, or **LE CHAMBON-FEUGEROLLES**, a town of France, department of Loire, in the arrondissement of St Etienne, and $5\frac{1}{2}$ miles S.W. of that town by rail, on a tributary of the Loire. Coal is mined in the neighbourhood, and there are forges, steel works, manufacture of ironmongery, and silk mills. The ancient castle of Feugerolles is noteworthy. Population (1901), 11,528.

Chambord, Henri Charles Ferdinand Marie Dieudonné, COMTE DE (1820-1883), was born in Paris on 29th September 1820. His father was the duc de Berry, the elder son of the comte d'Artois (afterwards Charles X.); his mother was the Princess Marie Caroline of Naples. Born seven months after the assassination of his father, he was hailed as the "enfant du miracle," and was made the subject of one of Lamartine's most famous poems. He was created duc de Bordeaux, and in 1821, as the result of a subscription organized by the Government, received the château of Chambord.¹ He was educated by tutors inspired by detestation of the French Revolution and its principles, and from the duc de Damas in particular imbibed those ideas of divine right and of devotion to the Church to which he always remained true. After the revolution of July, Charles X. vainly endeavoured to save the Bourbon cause by abdicating in his favour and proclaiming him king under the title of Henry V. (2nd August 1830). The comte de Chambord accompanied his grandfather into exile, and resided successively at Holyrood, Prague, and Görz. In 1841, during an extensive tour through Europe, he broke his leg—an accident that resulted in permanent lameness. The death of his grandfather, Charles X., in 1836, and of his uncle, the duc d'Angoulême, in 1844, left him the last male representative of the elder branch of the Bourbon family; but his marriage with the Archduchess Maria Theresa, eldest daughter of the duke of Modena (7th November 1846), remained without issue. The title to the throne thus passed to the comte de Paris, as representative of the Orleans branch of the house of Bourbon, and the history of the comte de Chambord's life is largely an account of the efforts made to unite the Royalist party by effecting a reconciliation between the two princes. Though he continued to hold an informal court, both on his travels and at his castle of Frohsdorf, near Vienna, yet he allowed the revolution of 1848 and the *coup d'état* of 1851 to pass without any decisive assertion of his claims. It was the Italian war of 1859, with its menace to the Pope's independence, that roused him at last to activity. He declared himself ready "to pay with his blood for the triumph of a cause which was that of France, the Church, and God Himself." Making common cause with the Church, the Royalists now began an active campaign against the empire. On 9th December 1866 he addressed a manifesto to General Saint-Priest, in which he declared the cause of the Pope to be that of society and liberty, and held out promises of retrenchment, civil and religious

liberty, "and above all honesty." Again, on 4th September 1870, after the fall of the empire, he invited Frenchmen to accept a government "whose basis was right and whose principle was honesty," and promised to drive the enemy from French soil. These vague phrases, offered as a panacea to a nation fighting for its life, showed conclusively his want of all political genius; they had as little effect on the French as his protest against the bombardment of Paris had on the Germans. Yet fortune favoured him. The elections placed the Republican party in a minority in the National Assembly; the abrogation of the law of exile against the royal family permitted him to return to his castle of Chambord; and it was thence that on 5th July 1871 he issued a proclamation, in which for the first time he publicly posed as king, and declared that he would never abandon the white standard of the Bourbons, "the flag of Henry IV., Francis I., and Joan of Arc," for the tricolour of the Revolution. He again quitted France, and answered the attempts to make him renounce his claims in favour of the comte de Paris by the declaration (25th January 1872) that he would never abdicate. In the following month he held a great gathering of his adherents at Antwerp, which was the cause of serious disturbances. A constitutional programme, signed by some 280 members of the National Assembly, was presented for his acceptance, but without result. The fall of Thiers in May 1873, however, offered an opportunity to the Royalists by which they hastened to profit. The comte de Paris and the prince de Joinville journeyed to Frohsdorf, and were formally reconciled with the head of the family (5th August). The Royalists were united, the premier (the duc de Broglie) an open adherent, the president (MacMahon) a benevolent neutral. MM. Lucien Brun and Chesnelong were sent to interview the comte de Chambord at Salzburg, and obtain the definite assurances that alone were wanting. They returned with the news that he accepted the principles of the French Revolution and the tricolour flag. But a letter to Chesnelong, dated Salzburg, 27th October, declared that he had been misunderstood: he would give no guarantees; he would not inaugurate his reign by an act of weakness, nor become "le roi légitime de la Révolution." "Je suis le pilot nécessaire," he added, "le seul capable de conduire le navire au port, parce que j'ai mission et autorité pour cela." This outspoken adherence to the principle of divine right did credit to his honesty, but it cost him the crown. The duc de Broglie carried the septennate, and the Republic steadily established itself in popular favour. A last effort was made in the National Assembly in June 1874 by the duc de la Rochefoucauld-Bisaccia, who formally moved the restoration of the monarchy. The comte de Chambord on 2nd July issued a fresh manifesto, which added nothing to his former declarations. The motion was rejected by 272 to 79, and on 25th February 1875 the Assembly definitely adopted the Republic as the national form of government. From this time the comte de Chambord, though continuing to publish letters on political affairs, made no further effort to regain the throne. He died at Frohsdorf on 24th August 1883.

See *Manifestes et programmes politiques de M. le comte de Chambord*, 1848-73 (1873), and *Correspondance de la famille royale et principalement de Mgr. le comte de Chambord avec le comte de Bouillé* (1884). Of the enormous literature relating to him, mention may be made of *Henri V. et la monarchie traditionnelle* (1871), *Le Comte de Chambord étudié dans ses voyages et sa correspondance* (1880), and *Henri de France*, by H. DE PÈNE (1885).

(H. SV.)

Champaign, a city of Champaign county, Illinois, U.S.A., situated in the eastern part of the state, on Embarras river, at an altitude of 740 feet. It is the seat of the state university, which had in 1898 a staff of

¹ This château is in the arrondissement of Blois, department of Loir-et-Oher, France, 10 miles E.S.E. of Blois. The park covers an area of 13,000 acres, of which 11,000 are under wood. The work of rebuilding the castle was undertaken by the comte de Chambord, continued till his death in 1883, and subsequently carried on by his successor, Prince John of Parma. Only the northern portion is completed. It comprises two square blocks. The castle has 440 apartments, and the stables are said to have stalls for 1200 horses.

professors and instructors numbering 183, and was attended by 1582 students, including 245 women. Its property was valued at \$1,544,000, and it had an income of \$355,000. The city is on the Illinois Central, the Wabash, and the Cleveland, Cincinnati, Chicago and St Louis railways. Population (1880), 5103; (1890), 6021; (1900), 9098 (973 foreign-born and 404 negroes).

Champaran, or CHUMPARUN, a district of British India, in the Patna division of Bengal, occupies the north-west corner of Behar, lying between the two rivers Gandak and Bagmati and the Nepal hills. It has an area of 3531 square miles. Population (1881), 1,721,608; (1891), 1,859,465, showing an increase of 8 per cent.; average density, 527 persons per square mile. Classified according to religion, Hindus in 1891 numbered 1,590,044; Mahomedans, 267,319; Christians, 2100, of whom 140 were Europeans; "others," 2. In 1901 the population was 1,791,026, showing a decrease of 4 per cent. The land revenue and rates are Rs.8,45,224; the number of police is 385; the number of boys at school (1896-97) is 16,062, being 12.3 per cent. of the male population of school-going age, the lowest rate in the whole province; the registered death-rate (1897) is 34.79 per thousand. The administrative headquarters are at Motihari (population, 13,108); Bettia is the centre of a very large estate; Segowlie, still a small military station, was the scene of a massacre during the Mutiny. Champaran is the chief seat of indigo planting in Behar. There are 18 concerns with 42 outworks, employing 37,000 hands, and producing an out-turn valued at Rs.22,00,000. There are also 44 saltpetre refineries, with an out-turn valued at Rs.3,09,000. The district suffered severely from drought in 1866 and 1874, and again in 1897. In the last year a small Government canal irrigated 11,000 acres, for which no water-rates are charged; and a canal from the Gandak will irrigate 85,000 acres. The district is traversed almost throughout its length to Bettia by the Tirhut state railway. A considerable trade is conducted with Nepal.

Champigny, a town in the arrondissement of Sceaux, department of Seine, France, $7\frac{1}{2}$ miles E.S.E. of Paris by rail, on the river Marne. There is a chapel in the early Renaissance style with fine stained glass. The town has manufactures of embroideries and piano-keys; and market-gardening is carried on in the vicinity. It was the scene, in 1870, of two battles during the Franco-Prussian war. A handsome monument, with crypt containing the remains of those who fell, both French and German, has been erected on the neighbouring height of Cœuilly. Population (1901), 6578.

Chancellorsville, a village of Spottsylvania county, Virginia, U.S.A., situated almost midway between Washington and Richmond, Virginia. It was the central point of one of the greatest battles of the Civil War, 2nd and 3rd May 1863, between the Union "army of the Potomac" under General Hooker, and the Confederate "army of Northern Virginia" under General Lee. The former, numbering about 120,000 men, crossed Rappahannock river and advanced upon the Confederates, who numbered about 60,000. After two days of severe fighting, in which the Union army lost 18,000 men and the Confederates 13,000, Hooker retreated with his army across the Rappahannock, his forward movement having been checked. Among the killed on the Confederate side was General "Stonewall" Jackson.

Chanda, a town and district of British India, in the Nagpur division of the Central Provinces. In 1881 the population of the town was 16,137, and in 1891 it was 16,175. Chanda was the capital of an ancient Gond king-

dom, and is still surrounded by a stone wall $5\frac{1}{2}$ miles in circuit. It has several old temples and tombs. There are manufactures of cotton, silk, brass-ware, and leather slippers, and a considerable local trade.

The district of CHANDA has an area of 10,749 square miles. The population in 1881 was 649,146, and in 1891 was 697,610, showing an increase of 8 per cent. and an average density of 65 per square mile. In 1901 the population was 589,399, showing a decrease of 15 per cent. The land revenue and rates were Rs.3,34,441, the incidence of assessment being Rs.0:2:9 per acre; the cultivated area in 1897-98 was 818,434 acres, of which 157,307 were irrigated almost entirely from tanks or artificial lakes; the number of police was 531; boys at school in 1896-97 numbered 7356, being 13.9 per cent. of the male population of school-going age; the registered death-rate in 1897 was 41.71 per thousand. The principal crops are rice, millet, pulse, wheat, oil-seeds, and cotton. The district contains the coal-field of Warora, which is connected by a branch with the Nagpur line of the Great Indian Peninsula railway. The mine, which is worked by Government, employs about 1400 hands. In 1897-98 the output was 115,682 tons, and the gross receipts were Rs.5,40,759, yielding a return of 7.7 per cent. on the capital. There is a fireclay industry under the same management. The district suffered severely from famine in 1900, when in April the number of persons relieved rose to 90,000.

Chandauli, a town of British India, in the Moradabad district of the North-West Provinces, 28 miles S. of Moradabad. Its population in 1891 was 28,111, and its municipal income in 1897-98 was Rs.21,837. It is an important station on the Oudh and Rohilkhand railway, with a junction for Aligarh. Its chief exports are of cotton, sugar, and stone. There is a factory for pressing cotton.

Changarnier, Nicolas-Anne-Théodule (1793-1877), French general, was born at Autun, Saône-et-Loire, on 26th April 1793. Educated at St Cyr, he served for a short time in one of the privileged companies of the bodyguard of Louis XVIII., and entered the 60th regiment of the line as a lieutenant in January 1815. He achieved distinction in the Spanish campaign of 1823, and became a captain in October 1825. In 1830 he entered the Royal Guard and was sent to Africa, where he took part in the Mascara expedition. Promoted major in 1835, he distinguished himself under Marshal Clausel in the campaign against Achmet Bey, and became a lieutenant-colonel in 1837. The part he took in the expedition of Portes-de-Fer gained him a colonelcy, and his success against the Hadjoutes and Kabyles the cross of the Legion of Honour. Three more years of brilliant service in Africa, during which he assisted in subjugating the tribes near Tenes, and was wounded at Medeah, won for him the rank of lieutenant-general of division in 1843, and the Algiers divisional command in 1847. He visited France early in 1848, assisted the provisional Government to establish order, and returned to Africa in May to succeed General Cavaignac in the government of Algeria. He was speedily recalled on his election to the General Assembly for the department of the Seine, and received the command of the National Guard of Paris, to which was added soon afterwards that of the troops in Paris, altogether nearly 100,000 men. He held a high place and exercised great influence in the complicated politics of the next two years (grand cross of the Legion of Honour, 5th April 1849). An avowed enemy of republican institutions, he held a unique position in upholding the power of the President; but in January 1851 he opposed Louis Napoleon's policy, was in consequence deprived of

his double command, and, at the *coup d'état* in December, was arrested and sent to Mazas, until his banishment from France by the decree of the 9th January 1852. He returned to France after the general amnesty, and resided on his estate in the department of Saône-et-Loire. During the Franco-Prussian war he served with the emperor of the French, and afterwards with Bazaine, until he became a prisoner of war on the capitulation of Metz. At the armistice he returned to Paris, and in 1871 was elected to the National Assembly by four departments, and sat for the Somme. He took an active part in politics, and served on the committee which elaborated the monarchical constitution, and, when the comte de Chambord refused the compromise, moved the resolution to extend the executive power for ten years to Marshal MacMahon. He was elected a life senator in 1875. He died in Paris on 14th February 1877, the funeral rites being celebrated at the church of the Invalides. (R. H. V.)

Changra, or KANKARI (ancient *Gangra*, and *Germanicopolis*), altitude 2500 feet, the chief town of a sanjak of the Kastamûri vilâyet in Asia Minor, situated in a rich, well-watered valley. The ground is impregnated with salt, and the town is unhealthy. Population 13,000, of whom 500 are Christians. Gangra, the capital of the kingdom of Deiotarus, son of Castor, was taken into the Roman province of Galatia in 7 B.C., and was later the metropolitan see of Paphlagonia.

Channel Islands, a group of islands in the English Channel, consisting of Jersey, Guernsey, Alderney, Sark, Herm, and one or two smaller islets which lie in the bay of St Michael, off the coast of Normandy, 15 miles W. from Cotentin and 88 miles S. by E. from Portland Bill. Their total area is about 75 square miles, of which 45 square miles belong to Jersey, 25 to Guernsey, and 3 to Alderney. Officially they are comprised in the English county of Hampshire and the diocese of Winchester. The islands of Alderney, Sark, Herm, and others are administratively counted as part of Guernsey.

JERSEY—Agriculture.—Between 1880 and 1899 the area of land under crops increased from 18,950 acres (65·9 per cent. of total area) to 19,361 acres (67·4 per cent.). The largest area was occupied by pasture and meadow land, namely, 8446 acres, or 29·4 per cent. of the total, in 1880, and 8253, or 28·7 per cent., in 1899; and potatoes, 4671 acres, or 16·9 per cent., in 1880, and 8484 acres, or 29·5 per cent., in 1899. All the cereals together (86·4 per cent. being wheat) only covered 2920 acres, or 10·1 per cent., in 1880; and 1868 acres, or 6·7 per cent., in 1899 (58·6 per cent. being wheat). Turnips, mangold, and other green crops are also grown in small quantities. The area devoted to orchards and market gardens (tomatoes, &c.) was 1569 acres in 1880 and 1209 acres in 1899. The live-stock statistics show a slight increase in the numbers of horses, cattle, and pigs in 1899 as compared with 1880, but a slight decrease in sheep. The figures for the year 1899 were 2447 horses, 12,559 cattle (of which 6964 were cows or heifers in milk or in calf), 298 sheep, and 7991 pigs. The area farmed by tenant occupiers increased from 11,289 acres in 1890 to 12,934 acres in 1899; and the area farmed by owners decreased from 8677 acres in 1890 to 6427 acres in 1899.

Climate.—According to Rev. H. W. Yorke,¹ the annual mean temperature for a period of 20 years was 51·7° Fahr., the mean of January 42·1° and of August 63°. The mean temperature of the sea-water ranges from 40° in December to 60° in August. The annual mean rainfall (25 years) is 34·2 inches. The average amount of sunshine was 1930 hours annually for the 15 years ending

1888, or 5 per cent. more than is recorded at the sunniest spot on the south coast of England; and 1980 hours for the years since 1888.

St Helier possesses good educational facilities in a ladies' college, a high school for girls, and Victoria College, and numerous private schools; also a public library (1736), which contains some Elzevirs, Plantins, &c., and the Beresford library. Since its formation in 1873 the Société Jersaise has excavated and examined most of the remaining megalithic monuments of the island known as *hougues* or *pouquelayes*. The harbour (40 acres) has 30 feet of water at ordinary spring tides, but is dry at low water. Prynne, the Puritan divine, was imprisoned in the (Norman) Orgueil Castle from 1637 to 1640.

The population of Jersey was 52,445 in 1881, 54,518 in 1891 (showing a density of 1211 inhabitants to the square mile), and 52,796 in 1901. In 1891 the birth-rate was 25·1; the death-rate, 20·9. In 1899 the ports of Jersey and Guernsey were cleared by 413 vessels of 52,227 tons; Jersey alone owned 95 vessels of 5532 tons, also 126 fishing boats of 391 tons.

GUERNSEY AND ITS DEPENDENT ISLANDS—Agriculture.

—Between 1880 and 1899 the area under crops increased from 11,123 acres, or 56·7 per cent. of the total area, to 11,663, or 59·5 per cent. The largest area was occupied by pasture and hay—namely, 6055 acres, or 30·8 per cent., in 1880, and 7162 acres, or 36·5 per cent., in 1899, or an increase of 1107 acres. Green crops covered 3256 acres, or 16·6 per cent., in 1880, and 2922, or 14·9 per cent., in 1899. The area under orchards and market gardens decreased from 683 acres in 1880 to 480 acres in 1899. The principal crops are oats, potatoes (741 acres in 1899), wheat, barley, mangold, and tares. Between 1880 and 1899 there was a slight increase in the number of horses, a slight decrease in cattle and pigs, and a large decrease (from 1013 to 328) in sheep; the figures for the latter year being 1645 horses, 7172 cattle (of which 3609 were cows and heifers in milk or in calf), and 4741 pigs. The total area farmed by tenants amounted to 5050 acres in 1899, and the area farmed by the owners to 6613 acres.

Climate.—The mean temperature of February, computed from a period of 40 years, is 43° Fahr., and of July, 60·6°. The rainfall gives an annual mean of 37½ inches. The amount of sunshine annually is about 2 per cent. less than in Jersey, or about 1890 hours in the year.

Population, &c.—Guernsey possesses two libraries, one with a museum attached; also a ladies' college and a lunatic asylum. The harbour of St Peter Port is 14 to 42 feet deep at ordinary spring tides, and 6 to 32 feet at ordinary neap tides, and possesses a floating dock and shipbuilding yards. In 1899 Guernsey owned 60 vessels of 6526 tons and 99 fishing boats of 349 tons. Victor Hugo spent several years of exile in Guernsey, the house which he occupied in St Peter Port being still in possession of his family. The population of Guernsey increased from 32,600 in 1881 to 35,243 in 1891 (showing a density of 1410 inhabitants to the square mile), and 40,477 in 1901. The birth-rate in 1891 was 23·3; the death-rate, 19·7. Population of Alderney, Sark, &c., 2657 in 1881, 2473 in 1891, and 2568 in 1901.

See G. G. CHISHOLM in *Scot. Geog. Mag.* 1886.

Channel Tunnel.—The scheme for uniting England with France by means of a tunnel was first put upon a practical basis in 1856 by an eminent French engineer, M. Thomé de Gamoud. His plans were exhibited at the Universal Exhibition of 1867. At the same time English engineers were also working at the same idea. Mr Low conceived the idea of connecting the railway systems of France and England, and selected on the English shore Fan Hole (see D on plan), a spot about

¹ *Quarterly Journ. of Meteorological Soc.*, No. 111. 1899.

half a mile west of the South Foreland Light, and on the French shore Sangatte, about four miles to the west of Calais, as the ends of the tunnel. Between these two points he considered galleries could be made entirely through the Dover Grey Chalk, which, owing to its comparative freedom from water and the general absence of cracks and fissures, offered exceptional facilities for work. Mr Low laid his plans before the Emperor of the French in 1867. Sir John Hawkshaw had also considered the question of a tunnel, and decided to make two borings at the ends of the line which seemed approximately the best position, and to examine the bottom of the Channel for some distance on each side of that line.

In the year 1866 borings were begun at St Margaret's Bay and near Sangatte (see A on plan); these proved that

PLAN OF PROPOSED CHANNEL TUNNEL.

the same strata of chalk which plunge under the sea in England reappear in the cliffs of France, and their continuity underneath the Channel was shown by samples obtained from the bed of the sea. The next step was the appointment of an international committee, which concluded that there was a reasonable prospect that the work could be done, and saw no reason to assume that its cost would exceed ten millions sterling. The French Government, accepting the scheme, in 1870 made a formal application for the views of the British Government, but the negotiations were broken off by the Franco-German war. They were renewed in 1871, and as a result the British Government intimated that it had "no objection in principle" to the tunnel. After some further communications between the two Governments in 1874, settling the basis on which the enterprise should be allowed to proceed, a joint commission was appointed to arrange details relating to jurisdiction, the right of blocking the tunnel, &c., and this commission's report was accepted by the Treasury as a basis of an agreement between the two Governments. In consequence of these negotiations two companies were formed. The French company received its concession in 1875, and the English Channel Tunnel Company, which had applied to Parliament for leave to construct preliminary works at St Margaret's, obtained its Act in the same year. The French Submarine Railway Company at once undertook costly preliminary operations, obtaining over 3000 samples of the bottom of the sea in the Strait, and taking more than 7000 soundings, which have rendered it possible to map the range of the chalk of the sea bottom with the same accuracy as in the cliffs. The shaft at Sangatte was sunk and the heading begun, in faith in the understanding arrived at between the two Governments. The English company was unable to obtain the necessary capital, owing to commercial depression, and its powers lapsed in 1880. The South-Eastern Railway had obtained powers in 1874 to sink experimental shafts on their property between Dover and Folkestone, and in 1881 to acquire lands, including the beach and foreshore, in that area for experimental works in connexion with the construction of a Channel tunnel. These resulted, in 1882, in the

formation of the Submarine Continental Railway Company, and, since at the same time the Channel Tunnel Company was resuscitated and made an application to Parliament, there were two rival schemes for making a tunnel from the English shore to join the French company in the middle of the Channel. The Submarine Railway Company proposed that its tunnel should start from the west of Dover, close to Shakespeare Cliff, and the Channel Tunnel Company selected Fan Hole for its starting-point instead of St Margaret's, as in its former scheme. The whole question was then widely discussed from various points of view and considered by several committees, the last of which—a joint select committee of the House of Lords and House of Commons—in 1883 expressed the opinion, although not unanimously, that it was "not expedient that Parliamentary

sanction should be given to a submarine communication between England and France." This decision prevented the carrying out of the enterprise by the English companies, and led to the formation of an amalgamated Channel Tunnel Company, which is still in existence and ready to act should opportunity occur. The

operations of the French company were also stopped, and it too awaits a reconsideration of the question by Parliament.

The physical characters of the rocks on both sides of the Strait are singularly well adapted for a tunnel from an engineering point of view.

The rocks exposed in the cliffs between Folkestone and St Margaret's, measured for the purposes of the proposed tunnel, are as follow, in descending order:—

		Thickness, English Feet.
Upper.	VI. St Margaret's Chalk	280
	V. Nodular Chalk with flints	100
	IV. Chalk with few flints	100
Middle.	III. Lower White Chalk with nodular layers, without flints	145
	II. Grey Chalk and Chalk Marl (No. II. of Price)	225
Lower.	I. Glauconitic Marl (No. I. of Price)	3
	Gault	120

The Gault, a stiff blue impervious clay, forms a low line of cliffs on the west side of Eastwear Bay, and disappears beneath low-water mark, opposite the western end of the Abbotscliffe. It occurs in St Margaret's Bay at a depth of 536 feet below O.D. The Glauconitic Marl, No. I., a clayey calcareous deposit, generally impervious, but sometimes so full of grains of glauconite and sand as to be pervious, overlies the Gault and passes into the Chalk Marl underlying the Lower Grey Chalk, No. II. This sets in in the cliff traversed by the Folkestone tunnel at 360 feet above O.D., and descends to Ordnance datum a little to the east of Shakespeare Cliff. It constitutes the base of the cliff from Abbotscliffe as far as that point. From this as far as the west base of Eastcliffe, the cliffs are composed of the Middle Chalk Nodular, and White, No. III., rising on the west to 490 + O.D., and plunging down to the east to a depth of -180 O.D. at St Margaret's. At its base is a hard nodular iron-stained layer, the Grit-bed of Price (the Melbourne Rock of the English Geological Survey), forming a conspicuous band in the English and French cliffs. The three upper members of the section constitute the Upper Chalk, out of which the cliffs between Dover and St Margaret's have been carved. All these strata dip steadily to the east at an inclination of about 1 in 72. On the French side, in the cliffs between St Pot and Sangatte, the Lower and Middle Chalk of the English section emerge from the sea with physical characters the same, and the thickness practically also the same. They dip also to the east, but at an angle of 1 in 46. The French survey of the sea bottom in the Strait for the purposes of the proposed tunnel proves that the Lower and Middle Chalk are perfectly continuous and constitute the sea floor, the

sea in the line of the tunnel being 210 feet in depth at the deepest point. It is obvious that a tunnel can be driven which would descend at an inclination of 1 in 70 or 80 on the English, sweep under the Channel, and rise with the strata on the French side, if it can be made in an impervious stratum which cannot be traversed by the sea-water under high pressure. The only stratum satisfying this condition is the Lower Grey Chalk, and especially the lower and more clayey horizon overlying the Glauconitic Marl.

Of the three English schemes, the first (Scheme A), proposed by Sir John Hawkshaw, starting from St Margaret's Bay, and the modification of it (Scheme D) starting from Fan Hole, present serious engineering difficulties because of the great volumes of water in the Upper and Middle Chalk. The third (Scheme C) provides for a tunnel in the same impervious stratum throughout the whole of its length. The general question as to danger from the influx of water either from the sea or from the land is also satisfactorily answered. The water which percolates in enormous volumes through the chalk from the land into the sea, as may be observed between Dover and St Margaret's, does not descend lower than the top of the Lower Grey Chalk, and an examination of the cliffs on both sides of the Strait proves that even where these lower rocks are traversed by faults, the water does not descend to the bottom of the series. There are no springs at this horizon in either the French or English cliffs. These considerations led to the selection of the sites at the Shakespeare Cliff and at Sangatte for the experimental shafts, and to the placing of the experimental drift-way under the Strait twenty-two miles long in the lowest stratum of the chalk. The selection is amply justified by the experience gained in the course of the work.

The works executed on the English side, under the superintendence of Mr Brady, by the Submarine Continental Railway Company, Sir Frederick Bramwell being the consulting engineer, and Professor Boyd Dawkins scientific adviser, consist of two shafts of small importance, and a third on the west side of the Shakespeare Cliff, sunk into the Chalk Marl down to a depth of 164 feet from the surface. From the bottom of this a drift-way, 7 feet in diameter, has been driven to a distance of about 2300 yards. This passes below low-water mark at a distance of 1350 yards from the shaft, leaving the shore diagonally in the direction of the head of the Admiralty Pier, and, running eastwards under the sea at an inclination of 1 in 72, it maintains the same position in the rocks throughout, being within a few feet of the Gault clay. Had it not been stopped by order of the Government in 1884, there is every reason to suppose that it would have been carried easily and without mishap across to the other side. The length already made proves that no danger need be apprehended from faults. It has cut through all those visible in the Shakespeare Cliff, and although at the time of driving there was a slight weeping of salt water through them to the amount of 3.3 gallons per minute, they gradually became blocked up and water-tight. When it was last examined by the writer of this article, after standing for five years, it was as dry as any similar drift-way could be, and the marks of the boring machine on the polished surface of the chalk were as distinct as on the day when they were made. On the French side the French Submarine Railway Company sank a shaft at Sangatte 18 feet in diameter to a depth of 226 feet. Unfortunately it intersected a fault in the upper strata which was in communication with the sea, and consequently let the water down to the area of work, which was at the same horizon in the rocks as on the English side, a few feet above the Gault. Two drift-ways had therefore to be made, the upper for the excavation and the lower for the drainage of the water descending the shaft towards the

working face. The former, which was cut by Beaumont's English machine, was 7 feet in diameter. It was carried to a distance of about one mile from the bottom of the shaft, underneath the bed of the sea, and traversed in its course several faults, which, like those on the English side, were perfectly water-tight.

Chantabun, the principal town of a province of Siam of the same name, situated on the east side of the Gulf of Siam, in 102° 6' E. long. and 12° 38' N. lat. The town lies about 12 miles from the sea, on the banks of a river which is navigable for small boats. Inside the bar which protects the entrance to the river a wide estuary offers secure and commodious anchorage for coasters. The town has now a population of about 5000. About 900 tons of white pepper is produced per annum, and sent to Bangkok for trans-shipment to Europe. Coffee, which has been grown on a small scale, has given good results. The ruby mines are scattered over an area about 15 miles square in the district of Krat. There are now fewer than 500 men working at these diggings. The sapphires exported from Chantabun come exclusively from Pailin on the east or Battambang side of the Patat, where some 2000 Shâns, mostly British subjects, and about 2000 Lao from the lower Mekong valley are employed at the diggings. Some £350,000 worth of rubies and sapphires is exported annually.

In 1893 the town of Chantabun was occupied by a small French force, about 400 strong, consisting mainly of Annamite tirailleurs. This occupation was effected under Act 6 of the Convention of the 3rd of October in that year, agreed to between the French and Siamese Governments, and was to last until the execution of the stipulations of the Convention, and more especially until the complete evacuation and pacification of the left bank of the Mekong and of the zones in which, by the treaty of the same date, the Siamese Government had to withdraw all armed forces. The occupation, which has in no way affected the trade or administration of the province, still continued in 1901, notwithstanding both the assurances made to the British Government in 1893 that it would only last a month and the repeated representations made on the subject by the Siamese Government.

Chantilly, a French town in the arrondissement of Senlis, department of Oise, 24 miles in direct line S.E. of Beauvais, on railway from Paris to Creil. The manufacture of lace and blonde is a decayed industry. A magnificent castle was erected, 1876-85, in Chantilly Park by the duc d'Aumale, on the foundations of the ancient château and in the style of the châtelet, the only remnant of the ancient pile of the Montmorencys. On the terrace is a bronze statue of Anne de Montmorency, and, opposite to the court of the châtelet, the pleasure ground known as Voltaire's Parterre. The whole is surrounded by fosses supplied with water from the Nonette. The duc d'Aumale installed in the castle a valuable library, specially rich in incunabula and 16th-century editions of classic authors, and a collection of the paintings of the great masters, besides many other objects

of art. By a public act in 1886 the duc gave the park and château with its superb collections to the Institute of France, in trust for the nation, reserving to himself only a life interest. He died in 1897, and the Institute then acquired full possession of the property. Population of town (1881), 3896; (1896), 3787; (comm.), 4093; (1901), 4791.

Chanzy, Antoine Eugène Alfred (1823-1883), French general, was born at Nouart, Ardennes, on 18th March 1823. The son of a cavalry officer, he was educated at the Naval School at Brest, but enlisted in the artillery, and subsequently passing through St Cyr, was commissioned in the Zouaves in 1843. He saw a good deal of fighting in Algeria, and was promoted captain in 1851 (Legion of Honour). As major of the 23rd Foot he served in the Lombardy campaign of 1859, and was present at Magenta and Solferino. He took part in the Syrian campaign of 1860 as a lieutenant-colonel (Officer, Legion of Honour); and as colonel commanded the 48th regiment at Rome in 1864. He returned to Algeria as general of brigade, assisted to quell the Arab insurrection, and commanded the subdivisions of Bel Abbes and Tlemcen in 1868 (Commander, Legion of Honour). Although he had acquired some professional reputation, he was in bad odour at the War Office on account of suspected contributions to the press, and of the publication of some jobbery in the supply of stores which he had discovered. At the outbreak of the Franco-German war he was curtly refused a brigade command; but, after the revolution, the government of national defence made him a general of division and gave him command of the 16th corps of the army of the Loire, with which he took a brilliant part in the battles of Coulmiers and Patay. On 5th December 1870 he was made commander-in-chief of the 2nd army of the Loire. He fought stubbornly against Von der Tann, the grand-duke of Mecklenburg, and the Red Prince, and showed conspicuous ability and military talent in the fighting from Beaugency to the Loire (6th to 11th December), in his retreat to Le Mans, where he re-formed his army in the final struggle in January, and, after the defeat of Le Mans, in the six days' fight in retiring to Laval behind the Mayenne to reconstruct his shattered forces, when the armistice stopped further operations. As Gambetta was the soul, Chanzy was the strong right arm of French resistance to the invader. He was made a Grand Officer of the Legion of Honour for his services. He represented the Ardennes in the National Assembly, and narrowly escaped capture by the Communists. In 1872 he became a member of the Committee of Defence and commander of the 7th army corps, and in 1873 was appointed governor of Algeria, where he remained for six years. In 1875 he was elected a life senator, in 1878 he received the Grand Cross of the Legion of Honour, and in 1879, without his consent, he was nominated for the presidency of the Republic, and received a third of the total votes. For two years he was ambassador at St Petersburg. He died suddenly at Châlons-sur-Marne, on 4th January 1883, only a few days after Gambetta, and his remains received a State funeral. He was the author of *La deuxième armée de la Loire*, published in 1872. (R. H. V.)

Chapra, or CHUPRA, a town of British India, the administrative headquarters of Saran district in the Behar province of Bengal, on the left bank of the river Gogra, just above its confluence with the Ganges; with a railway station on the Bengal and North-Western line towards Oudh. Population (1881), 51,670; (1891), 57,352; (1901), 45,392, showing a decrease of 21 per cent. There are a Government high school, a German

Lutheran mission, three printing-presses, and a public library endowed by the late Maharaja of Hatwa. Chapra is the centre of trade in indigo and saltpetre, and conducts a large business by water as well as by rail.

Charcot, Jean Martin (1825-1893), French physician, was born in Paris on 29th November 1825. In 1853 he graduated as M.D. of Paris University, and three years later was appointed physician of the Central Hospital Bureau. In 1860 he became a professor in the University, and in 1862 began that famous connexion with the Salpêtrière which lasted to the end of his life. He was elected to the Academy of Medicine in 1873, and ten years afterwards became a member of the Institute. His death occurred suddenly on 16th August 1893 at Morvan, where he had gone for a holiday. Charcot, who was a good linguist and well acquainted with the literature of his own as well as of other countries, excelled as a clinical observer and a pathologist. His work at the Salpêtrière exerted a great influence on the development of the science of neurology, and his classical *Leçons sur les maladies du système nerveux*, the first series of which was published in 1873, represents an enormous advance in the knowledge and discrimination of nervous diseases. He also devoted much attention to the study of obscure morbid conditions like hysteria, especially in relation to hypnotism; indeed, it is in connexion with his investigation into the phenomena and results of the latter that his name is popularly known. In addition to his labours on neurological and even physiological problems he made many contributions to other branches of medicine, his published works dealing, among other topics, with liver and kidney diseases, gout, and pulmonary phthisis. As a teacher he was remarkably successful, and always commanded an enthusiastic band of followers.

Chard, a municipal borough (extended 1892) and market town in the Southern parliamentary division of Somersetshire, England, 13 miles S.S.E. of Taunton by rail. It has manufactures of linen collars and lace. Population of borough (70 acres) (1881), 2411; (1891), 2575; (1891) on the extended area (403 acres), 4315; (1901), 4437.

Charente, a department in the west of France, nowhere rising to any remarkable elevation, watered by the Charente.

Area, 2306 square miles, with 29 cantons and 426 communes. The population was 366,408 in 1886, but only 344,376 in 1901. In 1899 the births were 6610, of which 343 were illegitimate; the deaths, 7144; and the marriages, 2753. Angoulême, the capital, had a population of 37,650 in 1901. In 1896 there were 921 schools with 48,000 pupils, the illiterate composing 7 per cent. of the population. The area under cultivation in 1896 comprised 1,307,234 acres, of which 845,130 acres were plough-land and 44,480 acres in vines. In 1899 the wheat crop gave a return of the value of £1,074,000. The green crop and grass lands, in which Charente takes a prominent place among the departments of France, produced nearly £1,000,000 in value. The yield of the vineyards amounted to the value of £438,000. Cognac is the centre of the distillation of brandy, to which the town gives its name, the annual production during the years 1886-1896 averaging 396,168 gallons. The live stock in 1899 included 81,320 horses, 92,960 cattle, 258,100 sheep, and 97,500 pigs. The paper made at Angoulême is much esteemed.

Charente Inférieure, a department in the west of France, bordering on the Atlantic Ocean and watered by the Charente.

Area, 2792 square miles, with 40 cantons and 480 communes. The population had dropped to 462,803 in 1886 and to 446,294 in 1901. Births in 1899, 8227, of which 393 illegitimate; deaths, 9136; marriages, 3273. La Rochelle, the capital, had a population in 1901 of 31,318. The department had in 1896, 1082 schools, with 57,000 pupils, and 3 per cent. of the population was illiterate. The area under cultivation in 1896 comprised 1,492,570 acres, 968,698 acres of which were plough-land and 79,076 acres in vines.

In 1899 the wheat crop yielded the value of £1,462,120, and the produce of the vines exceeded £1,284,000. There is a considerable distillation of alcohol, amounting to 1,320,000 gallons, in 1898. The live stock in 1899 included 38,090 horses, 155,580

cattle, 213,140 sheep, and 78,690 pigs. Among the mineral productions must be noted stone, clay, and sea-salt, the production of which last, however, amounted in 1898 to only 8500 metric tons.

CHARITY AND CHARITIES.

THE word "charity," or love, represents the principle of the good life. It stands for a mood or habit of mind and an endeavour. From it, as a habit of mind, springs the social and personal endeavour which in the widest sense we may call charity. The two correspond. Where the habit of mind has not been gained, the endeavour fluctuates and is relatively purposeless. In so far as it has been gained, the endeavour is founded on an intelligent scrutiny of social conditions and guided by a definite purpose. In the one case it is realized that some social theory must be found by us, if our action is to be right and consistent; in the other case no need of such a theory is felt. This article is based on the assumption that there are principles in charity or charitable work, and that these can be ascertained by a study of the development of social conditions and their relation to prevalent social aims and religious or philosophic conceptions. It is assumed also that the charity of the religious life, if rightly understood, cannot be inconsistent with that of the social life.

Perhaps some closer definition of charity is necessary. The words that signify goodwill towards the community and its members are primarily words expressive of the affections of family life in the relations existing between parents, and between parent and child. As will be seen, the analogies underlying such phrases as "God the Father," "children of God," "brethren," have played a great part in the development of charitable thought in pre-Christian as well as in Christian days. The germ, if we may say so, of the words *philia*, *agape*, *amor*, love; *amicitia*, friendship, is the sexual or the parental relation. With the realization of the larger life in man the meaning of the word expands. *Caritas*, or charity, strikes another note—high price, and thus dearth. It is charity, indeed, expressed in mercantile metaphor; and it would seem that it was associated in thought with the word *charis*, which has also a commercial meaning, but signifies as well favour, gratitude, grace, kindness. Partly thus, perhaps, it assumed and suggested a nobler conception; and sometimes, as, for instance, in English ecclesiastical documents, it was spelt *caritas*. *Agape*, which in the Authorized Version of the Bible is translated charity, was used by St Paul as a translation of the Hebrew word *chesed*, which in the Old Testament is in the same version translated "mercy"—as in Hosea vi. 6, "I desired mercy, and not sacrifice." This word represents the charity of kindness and goodness, as distinguished from almsgiving. Almsgiving, *tzedaka*, is translated by the word *elemosyna* in the Septuagint, and in the Authorized Version by the word "righteousness." It represents the deed or the gift which is due—done or made, not spontaneously, but under a sense of religious obligation. In the earlier Christian period the word almsgiving has this meaning, and was in that sense applied to a wide range of actions and contracts, from a gift to a beggar at a church door to a grant and a tenure of land. It also, in the word almoner, represented the fulfilment of the religious obligation with the aid of an agent or delegate. The words charity or love (*caritas* or *agape*), on the other hand, without losing the tone with which the thought of parental or family love inspires them, assume a higher meaning. In religious thought they imply an ideal life, as represented by such expressions as "love (*agape*) of God." This on the one side; and on the other an ideal social relation, in such words as "love of man." Thus in the word "charity" religious and social associations meet; and thus regarded the word means a disciplined and habitual mood in which the mind is considerate of the welfare of others individually and generally, and devises what is for their real good, and in which the intelligence and the will strive to fulfil the mind's purpose. Charity thus has no necessary relation to relief or alms. To give a lecture, or to nurse a sick man who is not in want or "poor," may be equally a deed of charity; though in fact charity concerns itself largely with the classes usually called "the poor," and with problems of distress and relief. Relief, however, is not an essential part of charity or charitable work. It is one of many means at its disposal. If the world were so poor that no one could make a gift, or so wealthy

that no one needed it, charity—the charity of life and of deeds—would remain.

The history of charity is a history of many social and religious theories, influences, and endeavours, that have left their mark alike upon the popular and the cultivated thought of the present day. The inconsistencies of charitable effort and argument may thus in part be accounted for. To understand the problem of charity we have therefore (1) to consider the stages of charitable thought—the primitive, pagan, Greek and Roman, Jewish and Christian elements, that make up the modern consciousness in regard to charity, and also the growth of the habit of "charity" as representing a gradually educated social instinct. (2) We have also to consider in their relation to charity the results of recent investigations of the conditions of social life. (3) At each stage we have to note the corresponding stage of practical administration in public relief and private effort—for the division between public or "poor-law" relief and charity which now prevails in England is, comparatively speaking, a novelty, and, generally speaking, the work of charity can hardly be appreciated or understood if it be considered without reference to public relief. (4) As to the present day, we have to consider practical suggestions in regard to such subjects as charity and economic thought, charity organization, friendly visiting and almonership, co-operation with the poor-law, charity and thrift, parochial management, hospitals and medical relief, exceptional distress and the "unemployed," the utilization of endowments and their supervision, and their adaptation to new needs and emergencies. (5) We have also throughout to consider charitable help in relation to classes of dependants, who appear early in the history of the question—widows and orphans, the sick and the aged, vagrants and wayfarers.

First in the series come the charities of the family and of hospitality; then the wider charities of religion, the charities of the community, and of individual donors and of mutual help. These gradually assumed importance in communities which consisted originally of self-supporting classes, within which widows and orphans, for instance, would be rather provided for, in accordance with recognized class obligations, than relieved. Then come habitual almsgiving, the charitable endowment, and the modern charitable institution and association. But throughout the test of progress or decadence appears to be the condition of the family. The family is the source, the home, and the hearthstone of charity. It has been created but slowly, and there is naturally a constant tendency to break away from its obligations and to ignore and depreciate its utility. Yet the family, as we now have it, is itself the outcome of infinite thought working through social instinct, and has at each stage of its development indicated a general advance. To it, therefore, constant reference must be made.

PART I.—PRIMITIVE CHARITY.

The study of early communities has brought to light the history of the development of the family. "Marriage in its lowest phases is by no means a matter of affection or companionship"; and only very slowly has the position of both parents been recognized as implying different but correlative responsibilities towards their child. Only very slowly, also, has the morality necessary to the making of

the family been won. Charity is hardly recognized as a virtue, nor infanticide as an evil. Hospitality—the beginning of a larger social life—is non-existent. The self-support of the community is secured by marriage, and when relations fail marriage becomes a provision against poverty. Then by the tribal system is created another safeguard against want. Apart also from these methods of maintenance, at a very early stage there is charitable relief. The festivals of the solstices and equinoxes, and of the seasons, are the occasions for sacrifice and relief; and, as Christmas customs prove, the instinct to give help or alms at such festival periods still remains. Charity is concerned primarily with certain elemental forces of social life; the relation between these primitive instincts and impulses that still influence charity should not, therefore, be overlooked. The basis of social life is also the basis of charitable thought and action.

The savage is the civilized man in the rough. "The lowest races have," Lord Avebury writes, "no institution of marriage." Many have no word for "dear" or "beloved." The child belongs to the tribe rather than to the parent. In these circumstances a problem of charity such as the following may arise:—"Am I to starve, while my sister has children whom she can sell?" a question asked of Burton by a negro. From the point of view of the tribe, an able-bodied man would be more valuable than dependent children, and the relationship of the larger family of brothers and sisters would be a truer claim to help than that of mother and child. Subsequently the child is recognized as related, not to the father, but to the mother, and there is "a kind of bond which lasts for life between mother and child, although the father is a stranger to it." Slowly only is the relative position of both parents, with different but correlative responsibilities, recognized. The first two steps of charity have then been made: the social value of the bond between the mother, and then between the father, and the child has been recognized. Until this point is reached the morality necessary to the making of the family is wanting, and for a long time afterwards it is hardly won. The virtue of chastity—the condition precedent to the higher family life—is unrecognized. Indeed, the set of such religious thought as there may be is against it. Abstract conceptions, even in the nobler races, are lacking. The religion of life is vaguely struggling with its animality, and that which it at last learns to rule it at first worships. In these circumstances there is little charity for the child and little for the stranger. "There is," Dr Schweinfurth wrote in his *Heart of Africa*, "an utter want of wholesome intercourse between race and race. For any member of a tribe that speaks one dialect to cross the borders of a tribe that speaks another is to make a venture at the hazard of his life." The religious obligations that fostered and sanctified family life among the Greeks and Romans and Jews are unknown. Much later in development comes charity for the child, with the abhorrence of infanticide—against which the Jewish-Christian charity of 2000 years ago uttered its most vigorous protests. If the child belonged primarily to the tribe or state, its maintenance or destruction was a common concern. This motive influenced the Greeks, who are historically nearer the earlier forms of social life than ourselves. For the common good they exposed the deformed child; but also "where there were too many, for in our state population has a limit," as Aristotle says, "the babe or unborn child was destroyed." And so, to lighten their own responsibilities, parents were wont to do in the slow years of the degradation of the Roman Empire, though the interest of the state then required a contrary policy. The transition to our present feeling of responsibility for child-life has been very gradual and uncertain, through the Middle Ages and even till the 18th century. Strictly it may be said that all penitentiaries and other similar institutions are concrete protests on behalf of a better family life. The movement for the care of children in the 18th century naturally and instinctively allied itself with the penitentiary movement. The want of regard for child-life, when it becomes a source of economic pressure, suggests how in earlier stages of civilization all that charitable apparatus for the assistance of children becomes unnecessary, even if the need, so far as it does arise, is not adequately met by the recognized obligations of the clan-family or brotherhood.

In the case of barbarous races charity and self-support may be considered from some other points of view. Self-support is secured in two ways—by marriage and by slavery. "For a man or woman to be unmarried after the age of thirty is unheard of" (T. H. Lewin, *Wild Races of South-East India*). On the other hand, if any one is without a father, mother, or other relative,

and destitute of the necessities of life, he may sell himself and become a slave. Thus slavery becomes a provision for poverty when relations fail. The clan-family may serve the same purpose. David Livingstone describes the formation of the clan-family among the Bakuena. "Each man, by virtue of paternity, is chief of his own children. They build huts round his. . . . Near the centre of each circle of huts is a spot called a 'kotla,' with a fireplace; here they work, eat, &c. A poor man attaches himself to the 'kotla' of a rich one, and is considered a child of the latter." Thus the clan-family is also a poor-relief association.

Studies in folk-lore bring to light many relations between the charity of the old world and that of our own day.

In regard to the charity of the early community, we may take the 8th century B.C. as the point of departure. The *Odyssey* (about 800 B.C.) and Hesiod (about 700 B.C.) are roughly parallel with Amos (816-775), and represent two streams of thought *The early community.* that meet in the early Christian period.

The period covered by the *Odyssey* seems to merge into that of Hesiod. We take the former first, dealing with the clan-family and the phratry, which are together the self-maintaining unit of society, with the general relief of the poor, with hospitality, and with vagrancy. In Hesiod we find the customary law of charity in the earlier community definitely stated, and indications of the normal methods of neighbourly help which were in force in country districts. First of the family and brotherhood, or phratry. The family (*Od.* viii. 582) included alike the wife's father and the daughter's husband. It was thus a clanlike family. Out of this was developed the phratry or brotherhood, in which were included alike noble families, peasants, and craftsmen, united by a common worship and responsibilities and a common customary law (*themis*). Zeus, the god of social life, was worshipped by the phratry. He was the father of the law (*themis*). He was god of host and guest. Society was thus based on law, the brotherhood, and the family. The irresponsible man, the man worthy of no respect or consideration, was one who belonged to no brotherhood, was subject to no customary law, and had no hearth or family. The phratry was, and became afterwards still more, "a natural guild." Outside the self-sustaining phratry was the stranger, including the wayfarer and the vagrant; and partly merged in these classes was the beggar, the recognized recipient of the alms of the community. To change one's abode and to travel was assumed to be a cause of reproach (*Il.* ix. 648). The "land-louper" was naturally suspected. On the other hand, a stranger's first thought in a new country was whether the inhabitants were wild or social (*dikaioi*), hospitable and God-fearing (*Od.* xiii. 201). Hospitality thus became the first public charity; Zeus sent all strangers and beggars, and it was against all law (*themis*) to slight them. Out of this feeling—a kind of glorified almsgiving—grew up the system of hospitality in Greek states and also in the Roman world. The host greeted the stranger (or the suppliant). An oath of friendship was taken by the stranger, who was then received with the greeting, Welcome (*Chaire*), and water was provided for ablution, and food and shelter. In the larger house there was a guests' table. In the hut he shared the peasant's meal. The custom bound alike the rich and poor. On parting presents were given, usually food for the onward journey, sometimes costly gifts. The obligation was mutual, that the host should give hospitality and that the guest should not abuse it. From early times tallies were exchanged between them as evidence of this formal relationship, which each could claim again of the other by the production of the token. And further, the relationship on either side became hereditary. Thus individuals and families and tribes remained linked in friendship and in the interchange of hospitalities.

Under the same patronage of Zeus and the same laws of hospitality were the vagrants and beggars. The vagrant

and loafer are sketched in the *Odyssey*—the vagrant who lies glibly that he may get entertainment, and the loafer who prefers begging to work on a farm. These and the winter idlers, whom Hesiod pictures—a group known to modern life—prefer at that season to spend their time in the warmth of the village smithy, or at a house of common resort (*lesche*)—a common lodging-house, we might say—where they would pass the night. Apparently, as in modern times, the vagrants had organized their own system of entertainment, and, supported by the public, were a class for whom it was worth while to cater. The local or public beggars formed a still more definite class. Their begging was recognized as their means of maintenance; it was a part of the method of poor relief. Thus of Penelope it was said that, if Ulysses' tale were true, she would give him better clothes, and then he might beg his bread throughout the country-side. Feasts too and almsgiving were nearly allied, and feasts have always been one resource for the relief of the poor. Thus naturally the beggars frequented feasts, and were apparently a recognized and yet inevitable nuisance. They wore, as part of their dress, scrips or wallets in which they carried away the food they received (as later the Roman clients carried away portions of food in baskets (*sportula*) from their patron's dinner). Ulysses, when he dresses up as a beggar, puts on a wallet as part of his costume. Thus we find a system of voluntary relief in force based on a recognition of the duty of almsgiving as complete and peremptory as that which we shall notice later among the Jews and the early Christians. We are concerned with country districts, and not with towns, and, as social conditions that are similar produce similar methods of administration, so we find here a general plan of relief similar to that which was in vogue in Scotland till the Scottish Poor Law Act of 1845.

In Hesiod the fundamental conceptions of charity are more clearly expressed. He has, if not his ten, at least his four commandments, for disobedience to which Zeus will punish the offender. They are: Thou shalt do no evil to suppliant or guest; thou shalt not dishonour any woman of the family; thou shalt not sin against the orphan; thou shalt not be unkind to aged parents.

The laws of social life are thus duty to one's guest and duty to one's family; and chastity has its true place in that relation, as the later Greeks, who so often quote Hesiod (cf. the so-called *Economics* of Aristotle), fully realized. Also the family charities due to the orphan, whose lot is deplored in the *Iliad* (xxii. 490), and to the aged are now clearly enunciated. But there is also in Hesiod the duty to one's neighbour, not according to the "perfection" of "Cristes lore," but according to a law of honourable reciprocity in act and intent. "Love him who loves thee, and cleave to him who cleaveth to thee: to him who would have given, give; to him who would not have given, give not." The groundwork of Hesiod's charity outside the family is neighbourly help (such as formed no small part of old Scottish charity in the country districts); and he put his argument thus: Competition, which is a kind of strife, "lies in the roots of the world and in men." It is good, and rouses the idle "handless" man to work. On one side are social duty (*dike*) and work, done briskly at the right season of the year, which brings a full barn. On the other side are unthrift and hunger, and relief with the disgrace of begging; and the relief, when the family can do no more, must come from neighbours, to whose house the beggar has to go with his wife and children to ask for victual. Once they may be helped, or twice, and then they will be refused. It is better, Hesiod tells his brother, to work and so pay off his debts and avoid hunger (see *Erga*, 391, &c., and elsewhere). Here indeed is a problem of to-day as it appeared to an early Greek. The alternatives before the idler—so far as his own community is concerned—are labour with neighbourly help to a limited extent, or hunger.

Hesiod was a farmer in Bœotia. Some 530 years afterwards a pupil of Aristotle thus describes the district and its community of farmers. "They are," he says, "well to do, but simple in their way of life. They practise justice, good faith, and hospitality. To needy townsmen and vagabonds they give freely of their sub-

stance; for meanness and covetousness are unknown to them." The charitable method of Homeric and Hesiodic days still continued.

PART II.—CHARITY AMONG THE GREEKS.

Society in a Greek state was divided into two parts, citizens and slaves. The citizens required leisure for education, war, and government. The slaves were their ministers and servants to enable *The Greek state.* them to secure this leisure. We have therefore to consider, on the one hand, the position of the family and the clan-family, and the maintenance of the citizen from public funds and by public and private charities; and on the other hand the condition of the slaves, and the relation between slavery and charity.

The slaves formed the larger part of the population. The census of Attica made between 317 and 307 B.C. gives their numbers at 400,000 out of a population of about 500,000; and even if this be considered excessive, the proportion of slaves to citizens would certainly be very large. The citizens with their wives and children formed some 12 per cent. of the community. Thus, apart from the resident aliens, returned in the census at 10,000, and their wives and children, we have two divisions of society: the citizens, with their own organization of relief and charities; and the slaves, permanently maintained by reason of their dependence on individual members of the civic class. Thus, the only poverty is that of the poor citizens. Poverty is limited to them. The slaves—that is to say, the bulk of the labouring population—are provided for.

From times relatively near to Hesiod's we may trace the growth and influence of the clan-family as the centre of customary charity within the community, the gradual increase of a class of poor either outside the clan-family or eventually independent of it, and the development of a new organization of relief introduced by the state to meet newer demands. We picture the early state as a group of families, each of which tends to form in time a separate group or clan. At each expansion from the family to the clan the members of the clan retain rights and have to fulfil duties which are the same as, or similar to, those which prevailed in the family. Thus, in Attica the clan-families (*genos*) and the brotherhoods (*phratry*) were "the only basis of legal rights and obligations over and above the natural family." The clan-family was "a natural guild," consisting of rich and poor members—the well-born or noble and the craftsman alike. Originally it would seem that the land was divided among the families of the clan by lot and was inalienable. Thus with the family was combined the means of supporting the family. On the other hand, every youth was registered in his phratry, and the phratry remained till the reforms of Cleisthenes (509 B.C.) a political, and even after that time a social, organization of importance.

First, as to the family—the mother and wife, and the father. Already before the age of Plato and Xenophon (450-350 B.C.) we find that the family has suffered a slow decline. The wife, according to later Greek usage, was married as a child, hardly educated, and confined to the house, except at some festival or funeral. But with the decline came criticism and a nobler conception of family life. "First, then, come laws regarding the wife," writes the author of the so-called *Economics* of Aristotle, and the law, "thou shalt do no wrong; for, if we do no wrong, we shall not be wronged." This is the "common law," as the Pythagoreans say, "and it implies that we must not wrong the wife in the least, but treat her with the reverence due to a suppliant, or one taken from the altar." The sanctity of marriage is thus placed among the "com-

mandments" of Hesiod, beside the duty towards the stranger and the orphan. These and other references to the Pythagoreans suggest that they, possibly in common with other mystics, preached the higher religion of marriage and social life, and thus inspired a deeper social feeling, which eventually allied itself with the Christian movement.

Next, as to parents and children: the son was under an obligation to support his father, subject, after Solon's time, to the condition that he had taught him a trade; and after Solon's time the father had no claim for support from an illegitimate son. "The possession of children," it was said (Arist. *Econ.*), "is not by nature for the public good only, but also for private advantage. For what the strong may gain by their toil for the weak, the weak in their old age receive from the strong. . . . Thus is the nature of each, the man and the woman, prearranged by the Divine Being for a life in common." Honour to parents is "the first and greatest and oldest of all debts" (Plato, *Laws*, 717). The child has to care for the parent in his old age. "Nemesis, the minister of justice (*dike*), is appointed to watch over all these things." And "if a man fail to adorn the sepulchre of his dead parents, the magistrates take note of it and inquire" (Xen. *Mem.* ii. 14). The heightened conception of marriage implies a fuller interpretation of the mutual relations of parent and child as well; both become sacred.

Then as to orphans. Before Solon's time (594 B.C.) the property of any member of the clan-family who died without children went to the clan; and after his time, when citizens were permitted to leave their property by will, the property of an intestate fell to the clan. This arrangement carried with it corresponding duties. Through the clan-family provision was made for orphans. Any member of the clan had the legal right to claim an orphan member in marriage; and, if the nearest agnate did not marry her, he had to give her a dowry proportionate to the amount of his own property. Later, there is evidence of a growing sense of responsibility in regard to orphans. Hippodamus (about 443 B.C.), in his scheme of the perfected state (Arist. *Pol.* 1268), suggested that there should be public magistrates to deal with the affairs of orphans (and strangers); and Plato, his contemporary, writes of the duty of the state and of the guardian towards them very fully. Orphans, he proposes (*Laws*, 927), should be placed under the care of public guardians. "Men should have a fear of the loneliness of orphans . . . and of the souls of the departed, who by nature take a special care of their own children. . . . A man should love the unfortunate orphan (boy or girl) of whom he is guardian as if he were his own child; he should be as careful and diligent in the management of the orphan's property as of his own—or even more careful still."

To relieve the poverty of citizens and to preserve the citizenship were objects of public policy and of charity. In Crete and Sparta the citizens were wholly supported out of the public resources. In Attica the system was different. The citizens were aided in various ways, in which, as often happens, legal or official and voluntary or private methods worked on parallel lines. The means were (1) legal enactment for release of debts; (2) emigration; (3) the supply of corn; (4) poor relief for the infirm, and relief for the children of those fallen in war; (5) emoluments; (6) voluntary public service, separate gifts and liberality; (7) loan societies.

(1) In 594 B.C. the labouring class in Attica were overwhelmed with debts and mortgages, and their persons pledged as security. Only by a sharp reform was it possible to preserve them from slavery. This Solon effected. He annulled their obligations, abolished the pledge of the person, and gave the labourers the franchise. And, in addition to this, besides the laws above mentioned, he gave power to the Areopagus to inquire from what

sources each man obtained the necessities of life, and to punish those who did not work. His action and that of his successor, Peisistratus (560 B.C.), suggests that the class of poor (*aporoí*) was increasing, and that by the efforts of these two men the social decline of the people was avoided or at least postponed. Peisistratus lent the poor money that they might maintain themselves in husbandry. He wished, it is said (Arist. *Ath. Pol.* xvi.), to enable them to earn a moderate living, that they might be occupied with their own affairs, instead of spending their time in the city or neglecting their work in order to visit it. As rent for their land they paid a tenth of the produce.

(2) Akin to this policy was that of emigration. Athenians, selected in some instances from the two lowest political classes, emigrated, though still retaining their rights of citizenship. In 570-565 B.C. Salamis was annexed and divided into lots and settled, and later Pericles settled more than 2750 citizens in the Chersonese and elsewhere—practically a considerable section of the whole body of citizens. "By this means," says Plutarch, "he relieved the state of numerous idle agitators and assisted the necessitous." In other states this expedient was frequently adopted.

(3) A third method was the supply of corn at reduced rates—a method similar to that adopted, as we shall see, at Rome, Constantinople, and elsewhere. The maintenance of the mass of the people depended on the corn fleets. There were public granaries, where large stores were laid up at the public expense. A portion of all cargoes of corn was retained at Athens and in other ways importation was promoted. Exportation was forbidden. Public donations and distributions of corn were frequent, and in times of scarcity rich citizens made large contributions with that object. The distributions were made to adult citizens of eighteen years of age and upwards, whose names were on the registers.

(4) In addition to this there was a system of public relief for those who were unable to earn a livelihood on account of bodily defects and infirmities. The qualification was a property test. The property of the applicant had to be shown to be of a value of not more than three minas (say £12). Socrates, it may be noted, adopts the same method of estimating his comparative poverty (Xen. *Econ.* ii. 6), saying that his goods would realize about five minæ (or about twenty guineas). The senate examined the case, and the ecclesia awarded the bounty, which amounted to 1 or 2 obols a day, rather more than 1½d. or 8d.—out-door relief, as we might say, amounting at most to about 1s. 9d. a week. There was also a fund for the maintenance of the children of those who had fallen in war, up to the age of eighteen.

(5) But the main source of support was the receipt of emoluments for various public services. This was not relief, though it produced in the course of time the effect of relief. It was rather the Athenian method of supporting a governing class of citizens.

The inner political history of Athens is the history of the extension of the franchise to the lower classes of citizens, with the privileges of holding office and receiving emoluments. About 650 B.C., at a time when trade was increasing, the citizens were classified on the basis of property. The rich retained the franchise and the right of holding office; the middle classes obtained the franchise; the fourth or labouring class gained neither. By the reforms of Cleisthenes (509 B.C.) the clan-family and the phratry were set aside for the *deme* or parish, a geographical division superseding the social. Finally, about 478 B.C., when all had acquired the franchise, the right to hold office also was obtained by the fourth class. These changes coincided with a period of economic progress. The rate of interest was high, usually 12 per cent.; and in trading and bottomry the returns were much higher. A small capital at this interest soon produced comparative wealth; and simultaneously prices were falling. Then came the reaction. "After the Peloponnesian war" (432 to 404 B.C.), writes Professor Jebb, "the wealth of the country ceased to grow, as population had ceased to grow about 50 years sooner. The rich went on accumulating; the poor, having no means of enriching themselves by enterprise, were for the most part occupied in watching for some chance of snatching a larger share of the stationary total." Thus the poorer classes in a time of prosperity had won the power which they were able to turn to their own account afterwards. A period of economic pressure followed, coupled with a decline in the population; no return to the land was feasible, nor was emigration; the people had become town-folk inadapted to new uses; decreasing vitality and energy were marked by a new temper, the "pauper" temper, unsettled, idle, and grasping, and political power was utilized to obtain relief. The relief was forthcoming, but it was of no avail to stop the general decline. The state, it might almost be said, in giving scope to the assertion of the spirit of dependence, had ruined the self-regarding energy on which both family and state alike depended. The emoluments were diverse. The number of citizens was not large; and the functions in which citizens could take part were numerous; and when payment was forthcoming the poorer citizens pressed in to exercise their rights (cf. Arist. *Pol.* 1293A). All Athenian citizens could attend the public

assembly or *ecclesia*. Probably the attendance at it varied from a few hundred to 5000 persons. In 395 B.C. the payment for attendance was fixed at 3 obols, or little more than 4d. a day—for the system of payment had probably been introduced a few years before (cf. Daremberg, *Dict. des Antig.*). A juror or *dikast* would receive the same sum for attendance, and the courts or juries would often consist of 500 persons. If the estimate (Böckh, *Public Economy of Athens*, Eng. trans., pp. 109, 117) holds good that in the age of Demosthenes (384-323 B.C.) the member of a poor family of four free persons could live (including rent) on about 3d. or between 2 and 3 obols a day, the pay of the citizen attending the assembly or the court would at least cover the expenses of subsistence. On the other hand, it would be less than the pay of a day labourer, which was probably about 4 obols or 6d. a day. In any case many citizens—they numbered in all about 20,000—in return for their participation in political duties would receive considerable pecuniary assistance. Attending a great public festival also, the citizen would receive 2 obols or 3d. a day during the festival days; and there were besides frequent public sacrifices, with the meal or feast which accompanied them. But besides this there were confiscations of private property, which produced a surplus revenue divisible among the poorer citizens. (Some hold that there were confiscations in other Greek states, but not in Athens.) In these circumstances it is not to be wondered that men like Isocrates should regret that the influence of the Areopagus, the old court of morals and justice in Athens, had disappeared, for it “maintained a sort of censorial police over the lives and habits of the citizens; and it professed to enforce a tutelary and paternal discipline, beyond that which the strict letter of the law could mark out, over the indolent, the prodigal, the undutiful, and the deserters of old rite and custom.”

(6) In addition to public emoluments and relief there was much private liberality and charity. Many expensive public services were undertaken honorarily by the citizens under a kind of civic compulsion. Thus in a trial about 425 B.C. (Lysias, *Or.* 19. 57) a citizen submitted evidence that his father expended more than £2000 during his life in paying the expenses of choruses at festivals, fitting out seven triremes for the navy, and meeting levies of income tax to meet emergencies. Besides this he had helped poor citizens by portioning their daughters and sisters, had ransomed some, and paid the funeral expenses of others (cf. for other instances Plutarch's *Cimon*, Theophras. *Eth.*, and Xen. *Econ.*).

(7) There were also mutual help societies (*eranoi*). Those for relief would appear to have been loan societies (cf. Theophr. *Eth.*), one of whose members would beat up contributions to help a friend, who would afterwards repay the advance.

The criticisms of Aristotle (384-322 B.C.) suggest the direction to which he looked for reform. He (*Pol.* 1320A) passes a very unfavourable judgment on the distribution of public money to the poorer citizens. The demagogues (he does not speak of Athens particularly) distributed the surplus revenues to the poor, who received them all at the same time; and then they were in want again. It was only, he argued, like pouring water through a sieve. It were better to see to it that the greater number were not so entirely destitute, for the depravity of a democratic government was due to this. The problem was to contrive how plenty (*euporia*, not poverty, *aporia*) should become permanent. His proposals are adequate aid and voluntary charity. Public relief should, he urges, be given in large amounts so as to help people to acquire small farms or start in business, and the well-to-do (*euporoi*) should in the meantime subscribe to pay the poor for their attendance at the public assemblies. (This proves, indeed, how the payments had become poor relief.) He mentions also how the Carthaginian notables divided the destitute amongst them and gave them the means of setting to work, and the Tarentines (*koina poiountes*) shared their property with the poor. (The Rhodians also might be mentioned (Strabo, xiv. c. 652), amongst whom the well-to-do undertook the relief of the poor voluntarily.) The later word for charitable distribution was a sharing (*koinonia*, Ep. Rom. xv. 26), which would seem to indicate that after Aristotle's time popular thought had turned in that direction. But the chief service rendered by Aristotle—a service which covered indeed the whole ground of social progress—was to show that unless the purpose of civil and social life was carefully considered and clearly realized by those who desired to improve its conditions, no change for the better could result from individual or associated action.

Two forms of charity have still to be mentioned: charity to the stranger and to the sick. It will be convenient to consider both in relation to the whole classical period.

With the growth of towns the administration of hospitality was elaborated.

(1) There was hospitality between members of families bound

by the rites of host and guest. The guest received as a right only shelter and fire. Usually he dined with the host the first day, and if afterwards he was fed, provisions were supplied to him. There were large guest chambers (*xenon*) or small guest houses, completely isolated on the right or left of the principal house; and here the guest was lodged. (2) There were also, e.g., at Hieropolis (Prof. W. M. Ramsay's *Phrygia*, ii. 97), brotherhoods of hospitality (*xenoi tekmoreioi*, bearers of the sign), which made hospitality a duty, and had a common chest and Apollo as their tutelary god. (3) There were inns or resting-places (*katagogion*) for strangers at temples (Thuc. iii. 68; Plato, *Larus*, 953A) and places of resort (*lesche*) at or near the temples for the entertainment of strangers—for instance, at a temple of Asklepios at Epidaurus (Pausanias, ii. 174); and Pausanias argues that they were common throughout the country. Probably also at the temples hospitable provision was made for strangers. The evidence at present is not perhaps sufficiently complete, but, so far as it goes, it tends to the conclusion that in pre-Christian times hospitality was provided to passers-by and strangers in the temple buildings, as later it was furnished in the monasteries and churches. (3) There were also in towns houses for strangers (*xenon*) provided at the public cost. This was so at Megara; and in Crete strangers had a place at the public meals and a dormitory. Xenophon suggested that it would be profitable for the Athenian state to establish inns for traders (*katagogia demosia*) at Athens. Thus, apart from the official hospitality of the proxenus or “consul,” who had charge of the affairs of foreigners, and the hospitality which was shown to persons of distinction by states or private individuals, there was in Greece a large provision for strangers, wayfarers, and vagrants based on the charitable sentiment of hospitality. Among the Romans similar customs of private and public hospitality prevailed; and throughout the empire the older system was altered, probably very slowly. In Christian times (cf. Ramsay above) Pagan temples were (about A.D. 408) utilized for other purposes, including that of hospitality to strangers.

Round the temples, at first probably village temples, the organization of medical relief grew up. Primitive medicine is connected with dreams, worship, and liturgical “pollution,” punishment and penitence, and an experimental practice. Finally, systematic observation and science (with no knowledge of chemistry and little of physiology) assert themselves, and a secular administration is created by the side of the older religious organization.

Sickness among primitive races is conceived to be a material substance to be extracted, or an evil spirit to be driven away by incantation. Religion and medicine are thus at the beginning almost one and the same thing. In Anatolia, in the groups of villages (cf. Ramsay as above, i. 101) under the theocratic government of a central *hieron* or temple, the god, Men Karou, was the physician and saviour (*soter* and *sozon*) of his people. Priests, prophets, and physicians were his ministers. He punished wrongdoing by diseases which he taught the penitent to cure. So elsewhere pollution, physical or moral, was chastened by disease and loss of property or children, and further ills were avoided by sacrifice and expiation and public warning. In the temple and out of this phase of thought grew up schools of medicine, in whose practice dreams and religious ritual retained a place. The newer gods, Asklepios and Apollo, succeeded the older local divinities; and the “sons” of Asklepios became a profession, and the temple with its adjacent buildings a kind of hospital. There were many temples of Asklepios in Greece and elsewhere, placed generally in high and salubrious positions. After ablution the patient offered sacrifices, repeating himself the words of the hymn that was chanted. Then, when night came on, he slept in the temple. In the early dawn he was to dream “the heavenly dream” which would suggest his cure; but if he did not dream, relations and others—officials at the temple—might dream for him. At dawn the priests or sons of Asklepios came into the temple and visited the sick, so that, in a kind of drama, where reality and appearance seemed to meet, the patients believed that they saw the god himself. The next morning the prescription and treatment were settled. At hand in the inn or guest chambers of the temple the patient could remain, sleeping again in the temple, if necessary, and carrying out the required regimen. In the temple were votive tablets of cases, popular and awe-inspiring, and records and prescriptions, which later found their way into the medical works of Galen and others. At the temple of Asklepios at Epidaurus was an inn (*katagogion*) with four courts and colonnades, and in all 160 rooms. (Cf. Pausanias, ii. 171; and Report, *Archæol. in Greece*, R. C. Bosanquet, 1899, 1900.)

At three centres more particularly, Rhodes, Knidos, and Cos, were the medical schools of the Asklepiads. If one may judge from an inscription at Athens, priests of Asklepios attended the poor gratuitously. And years afterwards, in the 11th century, when there was a revival of medicine, we find at Salerno the Christian priest as doctor, a simple and less palatable pharmacy for the poor, and gratuitous medical relief.

Besides the temple schools and hospitals there was a secular organization of medical aid and relief. States appointed trained medical men as physicians, and provided for them medical establishments (*iatreia*, "large houses with large doors full of light") for the reception of the sick, and for operations there were provided beds, instruments, medicines, &c. At these places also pupils were taught. A lower degree of medical establishment was to be found at the barbers' shops. Out-patients were seen at the *iatreia*. They were also visited at home. There were doctors' assistants and slave doctors. The latter, apparently, attended only slaves (Plato, *Leg.* iv. 720); they do "a great service to the master of the house, who in this manner is relieved of the care of his slaves." It was a precept of Hippocrates, that if a physician came to a town where there were sick poor, he should make it his first duty to attend to them; and the state physician attended gratuitously any one, who applied to him. There were also travelling physicians going rounds to heal children and the poor. These methods continued, probably all of them, to Christian times.

In Rome there were consulting-rooms and dispensaries, and houses in which the sick were received. Hospitals are mentioned by Roman writers in the 1st century A.D. There were infirmaries—detached buildings—for sick slaves; and in Rome, as at Athens, there were slaves skilled in medicine. In Rome also for each *regio* there was a chief physician who attended to the poorer people.

Slavery was so large a factor in pre-Christian and early Christian society that a word should be said on its relation to charity. Indirectly it was a cause of poverty and social degradation. Thus in the case of Athens, with the achievement of maritime supremacy the number of slaves increased greatly. Manual arts were despised as unbecoming to a citizen, and the slaves carried on the larger part of the agricultural and industrial work of the community; and for a time—until after the Peloponnesian war (404 B.C.)—slavery was an economic success. But by degrees the slave, it would seem, dispossessed the citizen and rendered him unfit for competition. The position of the free artisan thus became akin to that of the slave (Arist. *Pol.* 1260A, &c.), and slavery became the industrial method of the country. Though Greeks, Romans, Jews, and Christians spent money in ransoming individual slaves and also enfranchised many, no general abolition of slavery was possible. At last through economic changes the new status of *coloni*, who paid as rent part of the produce of the land they tilled, superseded the status of slavery. But this result was only achieved much later, when a new society was being created, when the slaves from the slave prisons (*ergastula*) of Italy joined its invaders, and the slave-owner or master, as one may suppose, unable any longer to work the gangs, let them become *coloni*.

In Greece the feeling towards the slave became constantly more humane. Real slavery, Aristotle said, was a cast of mind, not a condition of life. The slave was not to be ordered about, but to be commanded and persuaded like a child. The master was under the strongest obligation to promote his welfare. In Rome, on the other hand, slavery continued to the end a massive, brutal, industrial force—a standing danger to the state.

But alike in Greece and Rome the influence of slavery on the family was pernicious. The pompous array of domestic slaves, the transfer of motherly duties to slave nurses, the loss of that homely education which for most people comes only from the practical details of life—all this in later Greece and Italy, and far into Christian times, prevented that permanent invigoration and reform of family life which Jewish and Christian influences might otherwise have produced.

PART III.—CHARITY IN ROMAN TIMES.

As from the point of view of charity the well-being of the community depends upon the vigour of the deep-laid elemental life within it, so in passing to Roman times we consider the family first. The Roman family was unique in its completeness, and by some of its conditions the world has long been bound. The father alone had independent authority (*sui juris*), and so long as he lived all who were under his power—his wife, his sons, and their wives and children, and his unmarried daughters—could not acquire any property of their own. Failing father or husband, the unmarried daughters were placed under the guardianship of the nearest male members of the family. Thus the family, in the narrower sense in which we commonly use the word, as meaning descendants of a common father or grandfather, was, as it were, a single point of growth in a larger organism, the *gens*, which consisted of all those who shared a common ancestry.

The wife, though in law the property of her husband, held a position of honour and influence higher than that of the Greek wife, at least in historic times. She seems to come nearer to the ideal of Xenophon: "the goodwife should be the mistress of everything within the house." "A house of his own and the blessing of children appeared to the Roman citizen as the end and essence of life" (Mommsen, *Hist. Rome*). The obligation of the father to the sons was strongly felt. The family, past, present, and future, was conceived as one and indivisible. Each succeeding generation had a right to the care of its predecessor in mind, body, and estate. The training of the sons was distinctively a home and not a school training. Brought up by the father and constantly at his side, they learnt spontaneously the habits and traditions of the family. The home was their school. By their father they were introduced into public life, and though still remaining under his power during his lifetime, they became citizens, and their relation to the state was direct. The nation was a nation of yeomen. Only agriculture and warfare were considered honourable employments. The father and sons worked outdoors on the farm, employing little or no slave labour; the wife and daughters indoors at spinning and weaving. The drudgery of the household was done by domestic slaves. The father was the working head of a toiling household. Their chief gods were the same as those of early Greece—Zeus-Dionys and Hestia-Vesta, the goddess of the hearth and home. Out of this solid, compact family Roman society was built, and so long as the family was strong attachment to the service of the state was intense. The *res publica*, the common weal, the phrase and the thought, meet one at every turn; and never were citizens more patient and tenacious combatants on their country's behalf. The men were soldiers in an unpaid militia and were constantly engaged in wars with the rivals of Rome, leaving home and family for their campaigns and returning to them in the winter. With a hardness and closeness inconsistent with—indeed, opposed to—the charitable spirit, they combined the strength of character and sense of justice without which charity becomes sentimental and unsocial. In the development of the family, and thus, indirectly, of charity, they stand for settled obligation and unrelenting duty.

Under the protection of the head of the family "in dependent freedom" lived the clients. They were in a middle position between the freemen and the slaves. The relation between patron and client lasted for several generations; and there were many clients. Their number increased as state after state was conquered, and they formed the *plebs*, in Rome the *plebs urbana*, the lower orders of the city.

In relation to our subject the important factors are the family, the *plebs*, and slavery.

Two processes were at work from an early date, before the first agrarian law (486 B.C.): the impoverishment of the *plebs*, and the increase of slavery. The former led to the *annona civica*, or the free supply of corn to the citizens, and to the *sportula*, or the organized food-supply for poor clients, and ultimately to the *alimentarii pueri*, the maintenance of children of citizens by voluntary and imperial bounty. The latter (slavery) was the standing witness that, as self-support was undermined, the task of relief became hopeless, and the impoverished citizen, as the generations passed, became in turn dependant, beggar, pauper, and slave.

The great patrician families—"an oligarchy of warriors and slaveholders"—did not themselves engage in trade, but, entering on large speculations, employed as their agents their clients, *libertini* or freedmen, and, later, their slaves. The constant wars, for which the soldiers of a local militia were eventually retained in permanent service, broke up the yeomanry and very greatly reduced their number. Whole families of citizens became impoverished, and their lands were in consequence sold to the large patrician families, members of which had acquired lucrative posts, or prospered in their speculations, and assumed possession of the larger part of the land, the *ager publicus*, acquired by the state through conquest. The city had always been the centre of the patrician families, the patrons of the trading *libertini* and other dependants. To it now flocked as well the *meteci*, the resident aliens from the conquered states, and the poorer citizens, landless and unable for social reasons to turn to trade. There was thus in Rome a growing multitude of aliens, dispossessed yeomen, and dependent clients. Simultaneously slavery increased very largely after the second Punic war (202 B.C.). Every conquest brought slaves into the market, for whom ready purchasers were found. The slaves took the place of the freemen upon the old family estates, and the free country people became extinct. Husbandry gave place to shepherding. The estates were thrown into large domains (*latifundia*), managed by bailiffs and worked by slaves, often fettered or bound by chains, lodged in cells in houses of labour (*ergastula*), and sometimes cared for when ill in infirmaries (*vale-tudinaria*). In Crete and Sparta the slaves toiled that the mass of citizens might have means and leisure. In Rome the slave class was organized for private and not for common ends. In Athens the citizens were paid for their services; at Rome no offices were paid. Thus the citizen at Rome was, one might almost say, forced into a dependence on the public corn, for as the large properties swallowed up the smaller, and the slave dispossessed the citizen, a population grew up unfit for rural toil, disinclined to live by methods that pride considered sordid, unstable and pleasure-loving, and yet a serious political factor, as dependent on the rich for their enjoyments as they were on their patrons or the prefect of the corn in the city for their food.

It is estimated, from extremely difficult and uncertain data, that the population of Rome in the time of Augustus was about 1,200,000 or 1,500,000. At that time the *plebs urbana* numbered 320,000. If this be multiplied by three, to give a low average of dependants, wives, and children, this section of the population would number 960,000. The remainder of the 1,500,000, 540,000, would consist of (a) slaves, and (b) those, the comparatively few, who would be members of the great clan-families (*gentes*). Proportionately to Attica this seems to allow too small a population of slaves. But however this be, we may picture the population of Rome as consisting chiefly of a few patrician families ministered to by a very large number of slaves, and a populace of needy citizens, in whose ranks it was profitable for an outsider to find a place in order that he might participate in the advantages of state maintenance.

In Rome the clan-family became the dominant political

factor. The family, as in England and elsewhere in the Middle Ages, and even in later times, in these circumstances assumes an influence which is out of harmony with the common good. The social advantage of the family lies in its self-maintenance, its home charities, and its moral and educational force, but if its separate interests are made supreme, it becomes uncharitable and unsocial. In Rome this was the line of development. The stronger clan-families crushed the weaker, and became the "oligarchy of warriors and slaveholders." In the same spirit they possessed themselves of the *ager publicus*. The land obtained by the Romans by right of conquest was public. It belonged to the state, and to a yeoman state it was the most valuable acquisition. At first part of it was sold and part was distributed to citizens without property and destitute (cf. Plutarch, *Tib. Gracchus*). At a very early date, however, the patrician families acquired possession of much of it and held it at a low rental, and thus the natural outlet for a conquering farmer race was monopolized by one class, the richer clan-families. This injustice was in part remedied by the establishment of colonies, in which the emigrant citizens received sufficient portions of land. But the colonies were comparatively few, and after each conquest the rich families made large purchases, while the smaller proprietors, whose services as soldiers were constantly required, were unable to attend to their lands or to retain possession of them. To prevent this (367 B.C.) the Licinian law was passed, by which ownership in land was limited to 500 *jugera*, about 312 acres. It was ignored, however, and more than two centuries later the evil, the double evil of the dispossession of the citizen farmer and of slavery, reached a crisis. The slave war broke out (134 B.C.), and (133 B.C.) Tiberius Gracchus made his attempt to re-endow the Roman citizens with the lands which they had acquired by conquest. He undertook what was essentially a charitable or philanthropic movement, which was set on foot too late. He had passed through Tuscany, and seen with resentment and pity the deserted country where the foreign slaves and barbarians were now the only shepherds and cultivators. He had been brought up under the influence of Greek Stoical thought, with which, almost in spite of itself, there was always associated an element of pity. The problem which he desired to solve, though larger in scale, was essentially the same as that with which Solon and Peisistratus had dealt successfully. At bottom the issue lay between private property, considered as the basis of family life for the great bulk of the community, with personal independence, and pauperism, with the *annona* or slavery. In 133 B.C. Tiberius Gracchus became tribune. To expand society on the lines of private property, he proposed the enforcement of "the Licinian Rogations"; the rich were to give up all beyond their rightful 312 acres, and the remainder was to be distributed amongst the poor (*penes*). The measure was carried by the use of arbitrary powers, and followed by the death of Tiberius at the hands of the patricians, the dominant clan-families. In 132 B.C. Caius Gracchus took up his brother's quarrel, and proposed measures for emigration and for relief. The former failed; the latter apparently were acceptable to all parties, and continued in force long after C. Gracchus had been slain (121 B.C.). By the *lex frumentaria* he gave the citizens—those who had the Roman franchise—the right to purchase corn every month from the public stores at rather more than half-price, 6½ *asses*, or about 3½d., the peck. This, the fatal alternative, was accepted, and henceforth there was no possibility of a reversion to better social conditions.

The provisioning of Rome was, like that of Athens, a public service. There were public granaries (267 B.C.),

The
*annona
civica.*

and there was a quæstor to supervise the transit of the corn from Sicily and, later, from Spain and Africa, and an elaborate administration for collecting and conveying it. The *lex frumentaria* of Caius was followed by the *lex Octavia*, restricting the monthly sale to citizens settled in Rome, and to 5 *modii* ($1\frac{1}{2}$ bushels). According to Polybius, the amount required for the maintenance of a slave was 5 *modii* a month, and of a soldier 4. Hence the allowance, if continued at this rate, was practically a maintenance. The *lex Clodia* (58 B.C.) made the corn gratuitous to the *plebs urbana*.

Julius Cæsar (5 B.C.) found the number of recipients to be 320,000, and reduced them to 150,000. In Augustus's time they rose to 200,000. There seems, however, to be some confusion as to the numbers. From the *Ancyranum Monumentum* it appears that the *plebs urbana* who received Augustus's dole of 60 *denarii* (37s. 6d.) in his eighth consulship numbered 320,000. And (Suet. *Cæs.* 41) it seems likely that in Cæsar's time the lists of the recipients were settled by lot; further, probably only those whose property was worth less than 400,000 *sestercies* (£3541) were placed on the lists. It is probable, therefore, that 320,000 represents a maximum, reduced for purposes of administration to a smaller number (a) by a property test, and (b) by some kind of scrutiny. The names of those certified to receive the corn were exposed on bronze tablets. They were then called *cervarii*. They had tickets (*tesserae*) for purposes of identification, and they received the corn or bread in the time of the republic at the temple of Ceres, and afterwards at steps in the several (14) regions or wards of Rome. Hence the bread was called *panis gradilis*. In the middle of the 2nd century there were state bakeries, and wheaten loaves were baked for the people perhaps two or three times a week. In Aurelian's time (A.D. 270) the flour was of the best, and the weight of the loaf (one *uncia*) was doubled. To the gifts of bread were added pork, oil, and possibly wine; clothes also—white tunics with long sleeves—were distributed. In the period after Constantine (cf. Theod. *Code*, xiv. 15) three classes received the bread—the palace people (*palatini*), soldiers (*militares*), and the populace (*populares*). No distribution was permitted except at the steps. Each class had its own steps in the several wards. The bread at one step could not be transferred to another step. Each class had its own supply. There were arrangements for the exchange of stale loaves. Against misappropriation there were (law of Valentinian and Valens) severe penalties. If a public prosecutor (*actor*), a collector of the revenue (*procurator*), or the slave of a senator obtained bread with the cognizance of the clerk, or by bribery, the slave, if his master was not a party to the offence, had to serve in the state bakehouse in chains. If the master were involved, his house was confiscated. If others who had not the right obtained the bread, they and their property were placed at the service of the bakery (*pistrini exercitio subjugari*). If they were poor (*pauperes*) they were enslaved, and the delinquent client was to be put to death.

The right to relief was dependent on the right of citizenship. Hence it became hereditary and passed from father to son. It was thus in the nature of a continuous endowed charity, like the well-known family charity of Smith, for instance, in which a large property was left to the testator's descendants, of whom it was said that as a result no Smith of that family could fail to be poor. But the *annona civica* was an endowed charity, affecting not a single family, but the whole population. Later, when Constantinople was founded, the right to relief was attached to new houses as a premium on building operations. Thus it belonged not to persons only, but also to houses, and became a species of "immovable" property, passing to the purchaser of the house or property, as would the adscript slaves. The bread followed the house (*œdes sequantur annonæ*). If, on the transfer of a house, bread claims were lost owing to the absence of claimants, they were transferred to the treasury (*fisci viribus vindicentur*). But the savage law of Valentinian, referred to above, shows to what lengths such a system was pushed. Early in its history the *annona civica* attracted many to Rome in the hope of living there without working. For the 400 years since the *lex Clodia* was enacted constant injury had been done by it, and now (A.D. 364) people had to be kept off the civic bounty as if they were birds of prey, and

the very poor man (*pauperrimus*), who had no civic title to the food, if he obtained it by fraud, was enslaved. Thus, in spite of the abundant state relief, there had grown up a class of the very poor, the Gentiles of the state, who were outside the sphere of its ministrations. The *annona civica* was introduced not only into Constantinople, but also into Alexandria, with baleful results, and into Antioch. When Constantinople was founded the corn-ships of Africa sailed there instead of to Rome. On charitable relief, as we shall see, the *annona* has had a long-continued and fatal influence.

(1) If the Government considers itself responsible for provisioning the people it must fix the price of necessities, and to meet distress or popular clamour it will lower the price. It becomes thus a large relief society for the supply of corn. In a time of distress, when the corn laws were a matter of moment in England, a similar system was adopted in the well-known Speenhamland scale (1795), by which a larger or lesser allowance was given to a family according to its size and the prevailing price of corn. A maintenance was thus provided for the able-bodied and their families, at least in part, without any equivalent in labour; though in England labour was demanded of the applicant, and work was done more or less perfunctorily. In amount the Roman dole seems to have been equivalent to the allowance provided for a slave, but the citizen received it without having to do any labour task. He received it as a statutory right. There could hardly be a more effective method for degrading his manhood and denaturalizing his family. He was also a voter, and the alms appealed to his weakness and indolence; and the fear of displeasing him and losing his vote kept him, socially, master of the situation, to his own ruin. If in England now relief were given to able-bodied persons who retained their votes, this evil would also attach to it.

(2) The system obliged the hardworking to maintain the idlers, while it continually increased their number. The needy teacher in Juvenal, instead of a fee, is put off with a *tessera*, to which, not being a citizen, he has no right. "The foreign reapers," it was said, "filled Rome's belly and left Rome free for the stage and the circus." The freeman had become a slave—"stupid and drowsy, to whom days of ease had become habitual, the games, the circus, the theatre, dice, eating-houses, and brothels." Here are all the marks of a degraded pauperism.

(3) The system led the way to an ever more extensive slavery. The man who could not live on his dole and other scrapings had the alternative of becoming a slave. "Better have a good master than live so distressfully"; and "If I were free I should live at my own risk; now I live at yours," are expressions suggestive of the natural temptations of slavery in these conditions. The escaped slaves returned to "their manger." The *annona* did not prevent destitution. It was a half-way house to slavery.

(4) The effect on agriculture, and proportionally on commerce generally, was ruinous. The largest corn-market, Rome, was withdrawn from the trade—the market to which all the necessities of life would naturally have gravitated; and the supply of corn was placed in the hands of producers at a few centres where it could be grown most cheaply—Sicily, Spain, and Africa. The Italian farmer had to turn his attention to other produce—the cultivation of the olive and the vine, and cattle and pig rearing. The greater the extension of the system the more impossible was the regeneration of Rome. The Roman citizen might well say that he was out of work, for, so far as the land was concerned, the means of obtaining a living were placed out of his reach. While not yet unfitted for the country by life in the town, he at least could not "return to the land."

(5) The method was the outcome of distress and political hopelessness. Yet the rich also adopted it in distributing their private largess. Cicero (*De Off.* ii. 16) writes as though he recognized its evil; but though he expresses his disapprobation of the popular shows upon which the *ediles* spent large sums, he argues that something must be done, "if the people demand it, and if good men, though they do not wish it, assent to it." Thus in a guarded manner he approves a distribution of food—a free breakfast in the streets of Rome. One bad result of the *annona* was that it encouraged a special and ruinous form of charitable munificence.

The *sportula* was a form of charity corresponding to the *annona civica*. Charity and poor relief run on parallel lines, and when the one is administered without discrimination, little discrimination will usually be exercised in the other. It was the charity of the patron—of the chiefs of the clan-families to their clients.

The
sportula.

Between them it was natural that a relation, partly hospitable, partly charitable, should grow up. The clients who attended the patron at his house were invited to dine at his table. The patron, as Juvenal describes him, dined luxuriously and in solitary grandeur, while the guests put up with what they could get; or, as was usual under the empire, instead of the dinner (*cæna recta*) a present of food was given at the outer vestibule of the house to clients who brought with them baskets (*sportula*) to carry off their food, or even charcoal stoves to keep it warm. There was endless trickery. The patron (or almoner who acted for him) tried to identify the applicant, fearing lest he might get the dole under a false name; and at each mansion was kept a list of persons, male and female, entitled to receive the allowance. "The pilferer grabs the dole" (*sportulam furunculus captat*) was a proverb. The *sportula* was a charity sufficiently important for state regulation. Nero (A.D. 54) reduced it to a payment in money (100 *quadrantes*, about 1s.). Domitian (A.D. 81) restored the custom of giving food. Subsequently both practices—gifts in money and in food—appear to have been continued.

In these conditions the Roman family steadily decayed. Its "old discipline" was neglected; and Tacitus (A.D. 75), in his dialogue on Oratory, wrote (c. xxviii.) what might be called its epitaph. Of the general decline the laws of Cæsar and Augustus to encourage marriage and to reward the parents of large families are sufficient evidence.

The destruction of the working-class family must have been finally achieved by the imperial control of the *collegia*.

In old Rome there were corporations of craftsmen for common worship and for the maintenance of the traditions of the craft.

These corporations were ruined by slave labour, and becoming secret societies, in the time of Augustus were suppressed. Subsequently they were reorganized, and gave scope for much of the kindly charity of mutual help. They often existed in connexion with some great house, whose chief was their patron and whose household gods they worshipped. The guilds of the poor, or rather of the lower orders (*collegia tenuiorum*), consisted of artisans and others, and slaves also, who paid monthly contributions to a common fund to meet the expenses of worship, common meals, and funerals. Under Severus (A.D. 192) the *collegia* were extended, and more closely organized as industrial bodies. They were protected and controlled, as in England in the 15th century the municipalities affected the cause of the craft guilds and ended by controlling them. Industrial disorder was thus prevented; the Government were able to provide the supplies required in Rome and the large cities with less risk and uncertainty; and the workmen employed in trade, especially the carrying trade, became almost slaves. In the 2nd century, and until the invasions, there were three groups of *collegia*: (1) those engaged in various state manufactures; (2) those engaged in the provision trade; and (3) the free trades, which gradually lapsed into a kind of slavery. If the members of these guilds fled they were brought back by force. Parents had to keep to the trade to which they belonged; their children had to succeed them in it. A slave caste indeed had been formed of the once free workmen.

As a charitable protest against the destruction of children, in the midst of a broken family life, and increasing dependence and poverty, a special institution was founded (to use the Scottish word) for the "alimentation" of the children of citizens, at first by voluntary charity, and afterwards by imperial bounty.

Nerva and Trajan adopted the plan. Pliny (*Ep.* vii. 18) refers to it. There was a desire to give more lasting and certain help than an allotment of food to parents. A list of children, whose names were on the relief tables at Rome, was accordingly drawn up, and a special service for their maintenance established. Two instances are recorded in inscriptions—one at Veleia, one at Beneventum. The emperor lent money for the purpose at a low percentage—2½ or 5 per cent., as against the usual 10 or 12. At Veleia his loan amounted to 1,044,000 *sesterces*—about £8156, and 51 of the local landed proprietors mortgaged land, valued at

13 or 14 million *sesterces*, as security for the debt. The interest on the emperor's money at 5 per cent. was paid into the municipal treasury, and out of it the children were relieved. The figures seem small; at Veleia 300 children were assisted, of whom 86 were girls. The annual interest amounted to nearly £204, which divided among 300 gives about 13'6s. a head. The figures suggest that the money served as a charitable supplementation of the citizens' relief in direct aid of the children. Apparently the scheme was widely adopted. Curators of high position were the patrons; procurators acted as inspectors over large areas; and *quæstores alimentarii* undertook the local management. Antoninus Pius (A.D. 138), and Marcus Aurelius (A.D. 160), and subsequently Severus (A.D. 192), established these bursaries for children in the names of their wives. In the 3rd century the system fell into disorder. There were large arrears of payments, and in the military anarchy that ensued it came to an end. It is of special interest, as indicating a new feeling of responsibility towards children akin to the humane Stoicism of the Antonines, and an attempt to found, apart from temples or *collegia*, what was in the nature of a public endowed charity.

PART IV.—JEWISH AND CHRISTIAN CHARITY.

With Christianity two elements come into fusion, the Jewish and the Greco-Roman. To trace this fusion and its results it is necessary to describe the Jewish system of charity, and to compare it with that of the early Christian church, to note the theory of charity in Aristotle as representing Greek, and in St Paul as representing Christian thought, and to mark the Roman influences which moulded the administration of Ambrose and Gregory and Western Christianity generally.

In the early history of the Hebrews we find the family, clan-family, and tribe. With the Exodus (probably about 1390 B.C.) comes the law of Moses (cf. Kittel, *Hist. of the Hebrews*, Eng. trans., i. 244), the *Hebrew charity*. central and permanent element of Jewish thought.

We may compare it to the "commandments" of Hesiod. There is the recognition of the family and its obligations: "Honour thy father and mother"; and honour included help and support. There is also the law essential to family unity: "Thou shalt not commit adultery"; and as to property there is imposed the regulation of desire: "Thou shalt not covet thy neighbour's house." Maimonides (A.D. 1135), true to the old conception of the family (x. 16), calls the support of adult children, "after one is exempt from supporting them," and the support of a father or mother by a child, "great acts of charity; since kindred are entitled to the first consideration." To relief of the stranger the Decalogue makes no reference, but in the law it is constantly pressed; while the Levitical law (xix. 18) first applies a new standard to social life: "Thou shalt love thy neighbour as thyself." This thought is the outcome of a deep ethical fervour—the element which the Jews brought into the work of charity. In Judges and Joshua, the "Homeric" books of the Old Testament, the Hebrews appear as a passionately fierce and cruel people. Subsequently against their oppression of the poor the prophets protested with a vehemence as great as the evil was intense; and their denunciations remained part of the national literature, a standing argument that life without charity is nothing worth. Thus schooled and afterwards tutored into discipline by the tribulation of the exile (587 B.C.), they turned their fierceness into a zeal, which, as their literature shows, was as fervent in ethics as it was in religion and ceremonial. In the services at the synagogues, which supplemented and afterwards took the place of the Temple, the Commandments were constantly repeated and the Law and the Prophets read; and as the Jews of the Dispersion increased in number, and especially after the destruction of Jerusalem, the synagogues became centres of social and charitable co-operation. Thus rightly would a Jewish rabbi say, "On three things the world is stayed: on the Torah, and on worship, and on the bestowal of kindness." Also

there was on the charitable side an indefinite power of expansion. Rigid in its ceremonial, there it was free. Within the nation, as the Prophets, and after the exile, as the Psalms show, there was the hope of a universal religion, and with it of a universally recognized charity. St Paul accentuated the prohibitive side of the law and protested against it; but, even while he was so doing, stimulated by the Jewish discipline, he was moving unfettered towards new conceptions of charity and life—charity as the central word of the Christian life, and life as a participation in a higher existence—the “body of Christ.”

To mark the line of development, we would compare—

1. The family among the Jews and in the early Christian Church; 2. The sources of relief and the tithe, the treatment of the poor and their aid, and the assistance of special classes of poor; 3. The care of strangers; and, lastly, we would consider the theory of almsgiving, friendship or love, and charity.

1. As elsewhere, property is the basis of the family. Wife and children are the property of the father. But the wife is held in high respect. In the post-exilic period the virtuous wife is represented as laborious as a Roman matron, a “lady bountiful” to the poor, and to her husband wife and friend alike. Monogamy without concubinage is now the rule—is taken for granted as right. There is no “exposure of children.” The slaves are kindly treated, as servants rather than slaves—though in Roman times and afterwards the Jews were great slave-traders. The household is not allowed to eat the bread of idleness. “Six days,” it was said, “*must* [not *mayest*] thou work.” “Labour, if poor; but find work, if rich.” “Whoever does not teach his son business or work, teaches him robbery.” In Job xxxi., a chapter which has been called “an inventory of late Old Testament morality,” we find the family life developed side by side with the life of charity. In turn are mentioned the relief of the widow, the fatherless, and the stranger—the classification of dependants in the Christian Church; and the whole chapter is a justification of the homely charities of a good family. “The Jewish religion, more especially in the old and orthodox form, is essentially a family religion” (C. G. Montefiore, *Religion of Ancient Hebrews*).

In the early documents of the Church the fifth commandment is made the basis of family life (cf. Eph. vi. 1; *Apost. Const.* ii. 32, iv. 11)—if we take the first six books of the *Apost. Const.* as a composite production before A.D. 300, representing Judæo-Christian or Eastern Church thought). But two points are prominent. Duties are insisted on as reciprocal (cf. especially St Paul's Epistles), as, e.g., between husband and wife, parent and child, master and servant. Charity is mutual; the family is a circle of reciprocal duties and charities. This implies a principle of the greatest importance in relation to the social utility of charity. Further reference will be made to it later. Next the “thou shalt love thy neighbour” is translated from its position as one amongst many sayings to the chief place as a rule of life. In the *Teaching of the Twelve Apostles* (Jewish-Christian, early 1st cent. A.D.) the first commandment in “the way of life” is adapted from St Matthew's Gospel thus: “First, thou shalt love God who made thee; secondly, thy neighbour as thyself; and all things whatsoever thou wouldst not have done to thee, neither do thou to another.” A principle is thus applied which touches all social relations in which the “self” can be made the standard of judgment. Of this also later. To touch on other points of comparison: the earlier documents seem to ring with a reiterated cry for a purer family life (cf. the second, the negative, group of commandments in the *Teaching*, and the judgment of the apocalyptic writings,

such as the Revelations of Peter, &c.); and sharing the Jewish feeling, the riper conscience of the Christian community formulates and accepts the injunction to preserve infant life at every stage. It advocates, indeed, the Jewish purity of family life with a missionary fervour, and it makes of it a condition of church membership. The Jewish rule of labour is enforced (*Ap. Const.* ii. 63). If a stranger settle (*Teaching*, xii. 3) among the brotherhood, “let him work and eat.” And the father (*Const.* iv. 11) is to teach the children “such trades as are agreeable and suitable to their need.” And the charities to the widow, the fatherless, are organized on Jewish lines.

2. The sources of relief among the Jews were the three gifts of corn: (1) the corners of the field (cf. Lev. xix. &c.), amounting to a sixtieth part of it; (2) the gleanings, a definite minimum dropped in the process of reaping (Maimonides, *Laws of the Hebrews relating to the Poor*, iv. 1); (3) corn overlooked and left behind. So it was with the grapes and with all crops that were harvested, as opposed, e.g., to figs, that were gathered from time to time. These gifts were divisible three times in the day, so as to suit the convenience of the poor (Maim. ii. 17), and the poor had a right to them. They are indeed a poor-rate paid in kind such as in early times would naturally spring up among an agricultural people. Another gift “out of the seed of the earth” is the tithe. In the post-exilic period the septennial was in force. Each year a fiftieth part of the produce (Maim. vi. 2, and Deut. xviii. 4) was given to the priest (the class which in the Jewish state was supported by the community). Of the remainder one-tenth went to the Levite, and one-tenth in three years of the septennium was retained for pilgrimage to Jerusalem, in two given to the poor. In the seventh year “all things were in common.” Supplementing these gifts were alms to all who asked; “and he who gave less than a tenth of his means was a man of evil eye” (Maim. vii. 5). All were to give alms, even the poor themselves who were in receipt of relief. Refusal might be punished with stripes at the hand of the Sanhedrim. At the Temple alms for distribution to the worthy poor were placed by worshippers in the cell of silence; and it is said that in Palestine at meal times the table was open to all comers. As the synagogues extended, and possibly after the fall of Jerusalem (A.D. 70), the collection of alms was further systematized. There were two collections. In each city alms of the box or chest (*kupha*) were collected for the poor of the city on each Sabbath eve (later, monthly or thrice a year), and distributed in money or food for seven days. Two collected, three distributed. Three others gathered and distributed daily alms of the basket (*tamchui*). These were for strangers and wayfarers—casual relief “for the poor of the whole world.” In the Jewish synagogue community from early times the president (*parnass*) and treasurer were elected annually with seven heads of the congregation (see Abraham's *Jewish Life in the Middle Ages*, p. 54), and sometimes special officers for the care of the poor. A staff of almoners was thus forthcoming. In addition to these collections were the *pruta* given to the poor before prayers (Maim. x. 15), and moneys gathered to help particular cases (cf. *Jewish Life*, p. 322) by circular letter. There were also gifts at marriages and funerals; and fines imposed for breach of the communal ordinances were reserved for the poor. The distinctive feature of the Jewish charity was the belief that “the poor would not cease out of the land,” and that therefore on charitable grounds a permanent provision should be made for them—a poor-rate, in fact, subject to stripes and distraint, if necessary (Maim. vii. 10).

If we compare this with the early Church we find the following sources of relief: (1) The Eucharistic offerings, some consumed at the time, some carried home, some reserved for the absent (see Hatch, *Early Church*, p. 40). The ministration, like the Eucharist, was connected with the love feast, and was at first daily (Acts ii. 42, vi. 1, and the *Teaching*). (2) Freewill offerings and first fruits and voluntary tithes (*Ap. Con.* ii. 25) brought to the bishop and used for the poor—orphans, widows, the afflicted and strangers in distress, and for the clergy, deaconesses, &c. (3) Collections in churches on Sundays and week-days, alms-boxes, and gifts to the poor by worshippers as they entered church; also collections for special purposes (cf. for Christians at Jerusalem). Apart from “the corners,” &c., the sources of relief in the Christian and Jewish Churches are the same. The separate Jewish tithe for the poor, which (Maim. vi. 11, 13) might be used in part by the donor as personal charity, disappears. A voluntary tithe remains, in part used for the poor. We do not hear of stripes and distraint, but in both bodies there is a penitential system and excommunication (cf. *Jewish Life*, p. 52), and in both a settlement of disputes within the body (Clem. *Hom.* iii. 67). In both, too, there is the abundant alms provided in the belief of the permanence of

poverty and the duty of giving to all who ask. As to administration in the early Church (Acts vi. 3), we find seven deacons, the number of the local Jewish council; and later there were in Rome seven ecclesiastical relief districts, each in charge of a deacon. The deacon acted as the minister of the bishop (*Ep. Clem. to Jam. xii.*), reporting to him and giving as he dictated (*Ap. Con. ii. 30, 31*). He at first combined disciplinary powers with charitable. The presbyters also (*Polycarp Ad Phil. 6* (A.D. 69-155)), forming (Hatch, p. 69) a kind of bishop's council, visited the sick, &c. The bishop was president and treasurer. The bishop was thus the trustee of the poor. By reason of the churches' care of orphans responsibilities of trusteeship also devolved on him. The temples were in pagan times depositories of money. Probably the churches were also.

3. Great stress is laid by the Jews on the duty of gentleness to the poor (Maim. x. 5). The woman was to have first attention (Maim. vi. 13). If the applicant was hungry he was to be fed, and then examined to learn whether he was a deceiver (Maim. vii. 6). Assistance was to be given according to the want—clothes, household things, a wife, or a husband—and according to the poor man's station in life. For widows and orphans the "gleanings" were left. Both are the recognized objects of charity (Maim. x. 16, 17). "The poor and the orphan were to be employed in domestic affairs in preference to servants." The dower was a constant form of help. The ransoming of slaves took precedence of relief to the poor. The highest degree of alms deed (Maim. x. 7) was "to yield support to him who is cast down, either by means of gifts, or by loan, or by commerce, or by procuring for him traffic with others. Thus his hand becometh strengthened, exempt from the necessity of soliciting succour from any created being."

If we compare the Christian methods we find but slight difference. The absoluteness of "Give to him that asketh" is in the *Teaching* checked by the "Woe to him that receives: for if any receives having need, he shall be guiltless, but he that has no need shall give account, . . . and coming into distress . . . he shall not come out thence till he hath paid the last farthing." It is the duty of the bishop to know who is most worthy of assistance (*Ap. Con. ii. 3, 4*); and "if any one is in want by gluttony, drunkenness, or idleness, he does not deserve assistance, or to be esteemed a member of the church." The widow assumes the position not only of a recipient of alms, but a church worker. Some were a private charge, some were maintained by the church. The recognized "widow" was to be sixty years of age (cf. 1 Tim. v. 9 and *Ap. Con. iii. 1*), a bedeswoman and gossiping pauper often, if one may judge from the texts. Remarriage was not approved, and so that resource, which would have been adopted in an English manor court, was not available for self-support, and charity had to take its place. Orphans were provided for by members of the churches. The virgins formed another class, as, contrary to the earlier feeling, marriage came to be held a state of lesser sanctity. They too seem to have been also, in part at least, church workers. Thus round the churches grew up new groups of recognized dependants; but the older theory of charity was broad and practical—akin to that of Maimonides. "Love all your brethren, performing to orphans the part of parents, to widows that of husbands, affording them sustenance with all kindness, arranging marriages for those who are in their prime, and for those who are without a profession the means of necessary support through employment: giving work to the artificer and alms to the incapable" (*Ep. Clem. to James viii.*).

4. The Jews in pre-Christian and Talmudic times supported the stranger or wayfarer by the distribution of food (*tamchui*), and strangers were lodged in private houses; and there were inns provided at which no money was taken (cf. *Jewish Life*, p. 314). Subsequently, besides these methods, special societies were formed "for the entertainment of the resident poor and of strangers." There were commendatory letters also. These conditions prevailed in

the Christian Church also. The *Xenodocheion* was the first form of Christian hospital both for the stranger and for the sect. In the Christian community the endowment charity comes into existence in the 4th century, among the Jews not till the 13th. The charities of the synagogue without separate societies sufficed.

We may now compare the conceptions of Jews and Christians on charity with those of the Greeks. There are two chief exponents of the diverse views—Aristotle and St Paul; for to simplify the issues we refer to them only. Thoughts such as Aristotle's recast by the Stoic Panætius (185-112 B.C.), and used by Cicero in his *De Officiis*, became in the hands of St Ambrose arguments for the direction of the clergy in the founding of the mediæval Church; and in the 13th century Aristotle reasserts his influence through such leaders of mediæval thought as St Thomas Aquinas. St Paul's chapters on charity, but little appreciated and understood, one is inclined to think, have perhaps, more than any other words, prevented an absolute lapse into the materialism of almsgiving. After him we think of St Francis, the greatest of a group of men who, seeking reality in life, revived charity; but to the theory of charity it might almost be said that since Aristotle and St Paul nothing has been added until we come to the economic and moral issues which Dr Chalmers explained and illustrated.

The problem turns on the conception (1) of purpose, (2) of the self, and (3) of charity, love, or friendship as an active force in social life. To the Greek, or at least to Greek philosophic thought, purpose was the measure of goodness. To have no purpose was, so far as the particular act was concerned, to be simply irrational; and the less definite the purpose the more irrational the act. This conception of purpose was the touchstone of family and social life, and of the civic life also. In no sphere could goodness be irrational. To say that it was without purpose was to say that it was without reality. So far as the actor was concerned, the main purpose of right action was the good of the soul (*psyche*); and by the soul was meant the better self, "the ruling part" acting in harmony with every faculty and function of the man. With faculties constantly trained and developed, a higher life was gradually developed in the soul. We are thus, it might be said, what we become. The gates of the higher life are within us. The issue is whether we will open them and pass in.

Consistent with this is the social purpose. Love or friendship is not conceived by Aristotle except in relation to social life. Society is based on an interchange of services. This interchange in one series of acts we call justice; in another friendship or love. A man cannot be just unless he has acquired a certain character or habit of mind; and hence no just man will act without knowledge, previous deliberation, and definite purpose. So also will a friend fulfil these conditions in his acts of love or friendship. In the love existing between good men there is continuance and equality of service; but in the case of benefactor and benefited, in deeds of charity, in fact, there is no such equality. The satisfaction is on one side, but often not on the other. (The dilemma is one that is pressed, though not satisfactorily, in Cicero and Seneca.) The reason for this will be found, Aristotle suggests, in the feeling of satisfaction which men experience in action. We realize ourselves in our deeds—throw ourselves into them, as people say; and this is happiness. What we make we like: it is part of us. On the other hand, in the person benefited there may be no corresponding action, and in so far as there is not, there is no exchange of service or the contentment that arises from it. The "self" of the recipient is not drawn out. On the contrary, he may be made

*Greek,
Jewish,
and
Christian
thought.*

worse, and feel the uneasiness and discontent that result from this. In truth, to complete Aristotle's argument, the good deed on one side, as it represents the best self of the benefactor, should on the other side draw out the best self of the person benefited. And where there is not ultimately this result, there is not effective friendship or charity, and consequently there is no personal or social satisfaction. The point may be pushed somewhat further. In recent developments of charitable work the term "friendly visitor" is applied to persons who endeavour to help families in distress on the lines of associated charity. It represents the work of charity in one definite light. So far as the relation is mutual, it cannot at the outset be said to exist. The charitable friend wishes to befriend another; but at first there may be no reciprocal feeling of friendship on the other's part—indeed, such a feeling may never be created. The effort to reciprocate kindness by becoming what the friend desires may be too painful to make. Or the two may be on different planes, one not really befriending, but giving without intelligence, the other not really endeavouring to change his nature, but receiving help solely with a view to immediate advantage. The would-be befriender may begin "despairing of no man," expecting nothing in return; but if, in fact, there is never any kind of return, the friendship actually fails of its purpose, and the "friend's" satisfaction is lost, except in that he may "have loved much." In any case, according to this theory friendship, love, and charity represent the mood from which spring social acts, the value of which will depend on the knowledge, deliberation, and purpose with which they are done, and accordingly as they acquire value on this account will they give lasting satisfaction to both parties.

St Paul's position is different. He seems at first sight to ignore the state and social life. He lays stress on motive force rather than on purpose. He speaks as an outsider to the state, though technically a citizen. His mind assumes towards it the external Judaic position, as though he belonged to a society of settlers (*paroikoi*). Also, as he expects the millennium, social life and its needs are not uppermost in his thoughts. He considers charity in relation to a community of fellow-believers—drawn together in congregations. His theory springs from this social base, though it over-arches life itself. He is intent on creating a spiritual association. He conceives of the spirit (*pneuma*) as "an immaterial personality." It transcends the soul (*psyche*), and is the Christ life, the ideal and spiritual life. Christians participate in it, and they thus become part of "the body of Christ," which exists by virtue of love—love akin to the ideal life, *agape*. The word represents the love that is instinct with reverence, and not love (*philia*) which may have in it some quality of passion. This love is the life of "the body of Christ." Therefore no act done without it is a living act—but, on the contrary, must be dead—an act in which no part of the ideal life is blended. On the individual act or the purpose no stress is laid. It is assumed that love, because it is of this intense and exalted type, will find the true purpose in the particular act. And, when the expectation of the millennium passed away, the theory of this ideal charity remained as a motive force available for whatever new conditions, spiritual or social, might arise. Nevertheless, no sooner does this charity touch social conditions, than the necessity asserts itself of submitting to the limitations which knowledge, deliberation, and purpose impose. This view has been depreciated or ignored by Christians, who have been content to rely upon the strength of their motives, or perhaps have not realized what the Greeks understood, that society was a natural organism (Arist. *Pol.* 1253A), which develops,

fails, or prospers in accordance with definite laws. Hence endless failure in spite of some success. For love, whether we idealize it as *agape* or consider it a social instinct as *philia*, cannot be love at all unless it quickens the intelligence as much as it animates the will. It cannot, except by some confusion of thought, be held to justify the indulgence of emotion irrespective of moral and social results. Yet, though this fatal error may have dominated thought for a long time, it is hardly possible to attribute it to St Paul's theory of charity when the very practical nature of Judaism and early Christianity is considered. In his view the misunderstanding could not arise. And to create a world or "body" of men and women linked together by love, even though it be outside the normal life of the community, was to create a new form of religious organization, and to achieve for it (so far as it was achieved) what, *mutatis mutandis*, Aristotle held to be the indispensable condition of social life, friendship (*philia*), "the greatest good of states," for "Socrates and all the world declare," he wrote, that "the unity of the state" is "created by friendship" (Arist. *Pol.* ii. 1262B).

It should, however, be considered to what extent charity in the Christian Church was devoid of social purpose. (1) The Jewish conceptions of charity passed, one might almost say, in their completeness into the Christian Church. Prayer, the petition and the purging of the mind, fasting, the humiliation of the body, and alms, as part of the same discipline, the submissive renunciation of possessions—all these formed part of the discipline that was to create the religious mood. Alms henceforth become a definite part of the religious discipline and service. Humility and poverty hereafter appear as yoked virtues, and many problems of charity are raised in regard to them. The non-Christian no less than the Christian world appreciated more and more the need of self-discipline (*askesis*); and it seems as though in the first two centuries A.D., if any thought of reinvigorating society, they searched for the remedy rather in the preaching and practice of temperance than in the application of ideas that were the outcome of the observation of social or economic conditions. Having no object of this kind as its mark, almsgiving took the place of charity, and, as Christianity triumphed, the family life, instead of reviving, continued to decay, while the virtues of the discipline of the body, considered apart from social life, became an end in themselves, and it was desired rather to annihilate instinct than to control it. Possibly this was a necessary phase in a movement of progress, but however that be, charity, as St Paul understood it, had in it no part. (2) But the evil went farther. Jewish religious philosophy is not elaborated as a consistent whole by any one writer. It is rather a miscellany of maxims; and again and again, as in much religious thought, side issues assume the principal place. The direct effect of the charitable act, or almsgiving, is ignored. Many thoughts and motives are blended. The Jews spoke of the poor as the means of the rich man's salvation. St Chrysostom emphasizes this: "If there were no poor, the greater part of your sins would not be removed: they are the healers of your wounds" (*Hom.* xiv., Timothy, &c.). Alms are the medicine of sin. And the same thought is worked into the penitential system. Augustine speaks of "penance such as fasting, almsgiving, and prayer for breaches of the Decalogue" (Reichel, *Manual of Canon Law*, p. 23); and many other references might be cited. "Pecuniary penances" (*Ib.* 154), in so far as they were relaxations of or substitutes for bodily penances, were permitted because of the greater good thereby accruing to others" (and in this case they were—A.D. 1284—legally enforceable under English statute law). The penitential system takes for granted that the almsgiving is good for

others and puts a premium on it, even though in fact it were done, not with any definite object, but really for the good of the penitent. Thus almsgiving becomes detached from charity on the one side and from social good on the other. Still further is it vulgarized by another confusion of thought. It is considered that the alms are paid to the credit of the giver, and are realized as such by him in the after-world; or even that by alms present prosperity may be obtained, or at least evil accident avoided. Thus motives were blended, as indeed they now are, with the result that the gift assumed a greater importance than the charity, by which alone the gift should have been sanctified, and its actual effect was habitually overlooked or treated as only partially relevant.

(3) The Christian maxim of "loving (*agape*) one's neighbour as one's self" sets a standard of charity. Its relations are idealized according as the "self" is understood; and thus the good self becomes the measure of charity. In this sense, the nobler the self the completer the charity; and the charity of the best men, men who love (and understand) their neighbours best, having regard to their chief good, is the best, the most effectual charity. Further, if in what we consider "best" we give but a lesser place to social purpose, or even allow it no place at all, our "self" will have no sufficient social aim and our charity little or no social result. For this "self," however, religion has substituted not St Paul's conception of the spirit (*pneuma*), but a soul, conceived as endowed with a substantial nature, able to enjoy and suffer quasi-material rewards and punishments in the after-life; and in so far as the safeguard of this soul by good deeds or almsgiving has become a paramount object, the purpose of charitable action has been translated from the actual world to another sphere. Thus, as we have seen, the aid of the poor has been considered not an object in itself, but as a means by which the almsgiver effects his own ulterior purpose and "makes God his debtor." The problem thus handled raises the question of reward and also of punishment. Properly, from the point of view of charity, both are excluded. We may indeed act from a complexity of motives and expect a complexity of rewards, and undoubtedly a good act does refresh the "self," and may as a result, though not as a reward, win approval. But in reality reward, if the word be used at all, is according to purpose; and the only reward of a deed lies in the fulfilment of its purpose. In the theory of almsgiving which we are discussing, however, act and reward are on different planes. The reward is on that of a future life; the act relates to a distressed person here and now. The interest in the act on the doer's part lies in its post-mortal consequences to himself, and not either wholly or chiefly in the act itself. Nor, as the interest ends with the act—the giving—can the intelligence be quickened by it. The questions "How? by whom? with what object? on what plan? with what result?" receive no detailed consideration at all. Two general results follow. In so far as it is thus practised, almsgiving is out of sympathy with social progress. It is indeed alien to it. Next also the self-contained, self-sustained poverty that will have no relief and does without it, is outside the range of its thought and understanding. On the other hand, this almsgiving is equally incapable of influencing the weak and the vicious; and those who are suffering from illness or trouble it has not the width of vision to understand nor the moral energy to support so that they shall not fall out of the ranks of the self-supporting. It believes that "the poor" will not cease out of the land. And indeed, however great might be the economic progress of the people, it is not likely that the poor will cease, if the alms given in this spirit be large enough in amount to

affect social conditions seriously one way or the other. When we measure the effects of charity, this inheritance of divided thought and inconsistent counsels must be given its full weight.

The sub-apostolic church was a congregation, like a synagogue, the centre of a system of voluntary and personal relief, connected with the congregational meals (or *agapai*) and the Eucharist, and under the supervision of no single officer or bishop. *The organization of the parish and endowed charities.* Out of this was developed a system of relief controlled by a bishop, who was assisted chiefly by deacons or presbyters, while the *agapai*, consisting of offerings laid before the altar, still remained. Subsequently the meal was separated from the sacrament, and became a dole of food, or poor people's meal—e.g., in St Augustine's time in Western Africa—and it was not allowed to be served in churches (A.D. 391). As religious asceticism became dominant, the sacrament was taken fasting; it appeared unseemly that men and women should meet together for such purposes, and the *agapai* fell out of repute. Simultaneously it would seem that the parish (*paroichia*) became from a congregational settlement a geographical area.

The organization of relief at Rome illustrates both a type of administration and a transition. St Gregory's reforms (A.D. 590) largely developed it. The parochial system had been adopted probably about the middle of the 3rd century, but the diaconate probably remained centralized. At the end of the 4th century Pope Anastasius had founded deaconries in Rome, and endowed them largely "to meet the frequent demands of the diaconate." Gregory two hundred years later reorganized the system. He divided the fourteen old "regions" into seven ecclesiastical districts and thirty "titles" (or parishes). The parishes were under the charge of sixty-six priests; the districts were eleemosynary divisions. Each was placed under the charge of a deacon, not (Greg. *Ep.* xi. and xxviii.) under the priests (*presbyteri titularii*). Over the deacons was an archdeacon. It was the duty of the deacons to care for the poor, widows, orphans, wards, and old people of their several districts. They inquired in regard to those who were relieved, and drew up under the guidance of the bishop the register of poor (*matricula*). Only these received regular relief. In each district was an hospital or office for alms, of which the deacon had charge, assisted by a steward (or *oconomus*). Here food was given and meals were taken, the sick and poor were maintained, and orphan or foundling children lodged. The churches of Rome and of other large towns possessed considerable estates, "the patrimony of the patron saints," and to Rome belonged estates in Sicily which had not been ravaged by the invaders, and they continued to pay to it their tenth of corn, as they had done since Sicily was conquered. Four times a year (Milman, *Lat. Christ.* ii. 117) the shares of the (1) clergy and papal officers, (2) churches and monasteries, and (3) "hospitals, deaconries, and ecclesiastical wards for the poor," were calculated in money and distributed; and the first day in every month St Gregory distributed to the poor in kind corn, wine, cheese, vegetables, bacon, meal, fish, and oil. The sick and infirm were superintended by persons appointed to inspect every street. Before the pope sat down to his own meal a portion was separated and sent out to the hungry at his door. The Roman *plebs* had thus become the poor of Christ (*pauperes Christi*), and under that title were being fed by *civica annona* and *sportula* as their ancestors had been; and the deaconries had superseded the "regions" and the "steps" from which the corn had been distributed. The *hospitium* was now part of a common organization of relief, and the sick were visited according to Jewish and early

Christian precedent. How far kindly Romans visited the sick of their day we do not know. Alms and the *annona* were now, it would seem, administered concurrently; and there was a system of poor relief independently of the churches and their alms (unless these, organized, as in Scottish towns, on the ancient ecclesiastical lines, were paid wholly or in part to a central diaconate fund). Much had changed, but in much Roman thought still prevailed. On this model (see below) the organization of poor relief in the Middle Ages was framed. On the one hand the officers of the Church (Charlemagne's *Capit.* 779)—bishops, abbots, and abbesses—were expected to give according to their means a definite sum for the relief of the poor, or to maintain a certain number of families during the winter; and, on the other hand, the citizens of the cathedral city and its neighbouring parishes were to support their own poor.

The change in sentiment and method could hardly be more strongly marked than by a comparison of "the *Teaching*" with St Ambrose's (334-397) "Duties of the Clergy" (*De Officiis Ministrorum*). For the old instinctive obedience to a command there is now an endeavour to find a reasoned basis for charitable action. Pauperism is recognized. "Never was the greed of beggars greater than it is now. . . . They want to empty the purses of the poor, to deprive them of the means of support. Not content with a little, they ask for more. . . . With lies about their lives they ask for further sums of money." "A method in giving is necessary." But in the suggestions made there is little consistency. Liberality is urged as a means of gaining the love of the people; a new and a false issue is thus raised. The relief is neither to be "too freely given to those who are unsuitable, nor too sparingly bestowed upon the needy." Everywhere there is a doctrine of the mean reflected through Cicero's *De Officiis*, the doctrine falsely stated, as though it were a mean of quantity, and not that rightly tempered mean which is the harmony of opposing moods. The poor are not to be sent away empty. Those rejected by the Church are not to be left to the "outer darkness" of an earlier Christianity. They must be supplied if they are in want. The methodic giver is "hard towards none, but is free towards all." Consequently none are refused, and no account is taken of the regeneration that may spring up in a man from the effort towards self-help which refusal may originate. Thus after all it appears that method means no more than this—to give sometimes more, sometimes less, to all needy people. In the small congregational church of early Christianity, each member of which was admitted on the conditions of strictest discipline, the common alms of the faithful could hardly have done much harm within the body, even though outside they created and kept alive a horde of vagrant alms-seekers and pretenders. Now in this department at least the Church had become the state, and discipline and a close knowledge of one's fellow-Christians no longer safeguarded the alms. From Cicero is borrowed the thought of "active help," which "is often grander and more noble," but the thought is not worked out. From the social side the problem is not understood or even stated, and hence no principle of charity or of charitable administration is brought to light in the investigation. Still there are rudiments of the economics of charity in the praise of Joseph, who made the people *buy* the corn, for otherwise "they would have given up cultivating the soil; for he who has the use of what is another's often neglects his own." Perhaps, as St Augustine inspired the theology of the Middle Ages, we may say that St Ambrose, in the mingled motives, indefiniteness, and kindness of this book, stands for the charity of the Middle Ages, except in so far as the movement which culminated in the brotherhood of St Francis awakened the intelligence of the world to wider issues.

In Constantinople the pauperism seems to have been extreme. The corn supplies of Africa were diverted there in great part when it became the capital of the empire. This must have left to Rome a larger scope for the development of the civic-religious administration of relief. St Chrysostom's sermons give no impression of the rise of any new administrative force, alike sagacious and dominant. The appeal to give alms is constant, but the positive counsel on charitable work is *nil*. The people had the *annona civica*, and imperial gifts, corn, allowances (*salaria*) from the treasury granted for the poor and needy, and an annual gift of 50 gold pounds (rather more than £1400) for funerals. Besides these there were many institutions, and the begging and the

almsgiving at the church doors. "The land could not support the lazy and valiant beggars." There were public works provided for them; if they refused to work on them they were to be driven away. The sick might visit the capital, but must be registered and sent back (A.D. 382); the sturdy beggar was condemned to slavery. So little did alms effect. And in the East monasticism seems to have produced no firmness of purpose such as led to the organization of the Church and of charitable relief under St Gregory.

Another movement of the Byzantine period was the establishment of the endowed charity. The Jewish synagogue long served as a place for the reception of strangers—a religious *xenodochion*. Probably the strangers referred to in "the *Teaching*" were so entertained. The table of the bishop and a room in his house served as the guest chamber, for which afterwards a separate building was instituted. In the East the Jewish charitable inn first appears, and there took place the earliest extension of institutions. There was probably a demand for an elaboration of institutions as social changes made themselves felt in the churches. We have seen this in the case of the *agape*. Similar changes would affect other branches of charitable work. The hospital (*hospitalium*, *xenodochion*) is defined as a "house of God in which strangers who lack hospitality are received" (*Suicer: Thesaur.*), a home separated from the church; and round the church, from the primitive *xenodochion* of early Christian times and the entertainment of strangers at the houses of members of the community, would grow up other similar charities. In A.D. 321 license was given by Constantine to leave property to the Church. The churches were thus placed in the same position as pagan temples, and though subsequently Valentinian (A.D. 379) withdrew the permission on account of the shameless legacy-hunting of the clergy, in that period much must have been done to endow Church and charitable institutions. In the same period grew to its height the passion for monasticism. This affected the parish and the endowed charity alike. Under its influence the deacon as an almoner tends to disappear, except where, as in Rome, there is an elaborate system of relief. Nor does it seem that deaconesses, widows, and virgins continued to occupy their old position as church workers and alms-receivers. Naturally when marriage was considered "in itself an evil, perhaps to be tolerated, but still degrading to human nature," and (A.D. 385) the marriage of the clergy was prohibited, men, except those in charge of parishes, and women would join regular monastic bodies; the deacon, as almoner, would disappear, and the "widows" and virgins would become nuns. Thus there would grow up a large body of men and women living segregated in institutions, and forming a leisured class able to superintend institutional charities. And now two new officers appear, the *eleemosynarius* or almoner and the *oeconomus* or steward (already an assistant treasurer to the bishop), who superintend and distribute the alms and manage the property of the institution. (In the first six books of the *Apost. Constit.* A.D. 300 these officers are not mentioned.) In these circumstances the *hospitium* or hospital (*xenon*, *katagogion*) assumes a new character. It becomes in St Basil's hands (A.D. 330-379) a resort not only for those who "visit it from time to time as they pass by, but also for those who need some treatment in illness." And round St Basil at Cæsarea there springs up a colony of institutions. Four kinds principally are mentioned in the Theodosian code: (1) the guest houses (*xenodocheia*); (2) the poor-houses (*ptocheia*), where the poor (*mendici*) were housed and maintained (the *ptocheion* was a general term also applied to all houses for the poor, the aged, orphans, and sick); (3) there were orphanages (*orphanotropheia*) for

orphans and wards; and (4) there were houses for infant children (*brephotrophia*). Thus a large number of endowed charities had grown up. This new movement it is necessary to consider in connexion with the law relating to religious property and bequests, in its bearing on the rule of the monasteries, and in its effect on the family.

The sacred property (*res sacra*) of Roman law consisted of things dedicated to the gods by the pontiff with the authority of the civil authority, in turn, the people, the senate, and the emperor. Things so consecrated were inalienable. Apart from this in the empire, the municipalities as they grew up were considered "juristic persons" who were entitled to receive and hold property. In a similar position were authorized *collegia*, amongst which were the mutual aid societies referred to above. Christians associated in these societies would leave legacies to them. Thus (W. M. Ramsay, *Cities and Bishoprics of Phrygia*, I. i. 119), an inscription mentions a bequest (possibly by a Christian) to the council (*synedrion*) of the presidents of the dyers in purple for a ceremonial, on the condition that, if the ceremony be neglected, the legacy shall become the property of the guild for the care of nurslings; and in the same way a bequest is left in Rome (*Orelli*, 4420) for a memorial sacrifice, on the condition that, if it be not performed, double the cost be paid to the treasury of the corn-supply (*fisco stationis annonae*). No unauthorized *collegia* could receive a legacy. "The law recognized no freedom of association." Nor could any private individual create a foundation with separate property of its own. Property could only be left to an authorized juristic person, being a municipality or a *collegium*. But as the problem of poverty was considered from a broader standpoint, there was a desire to deal with it in a more permanent manner than by the *annona civica*. The *pueri alimentarii* (see above) were considered to hold their property as part of the *fiscus* or property of the state. Pliny (*Ep.* vii. 18), seeking a method of endowment, transferred property in land to the steward of public property, and then took it back again subject to a permanent charge for the aid of children of freemen. By the law of Constantine and subsequent laws no such devices were necessary. Widows or deaconesses, or virgins dedicated to God, or nuns (A.D. 455), could leave bequests to a church or memorial church (*martyrium*), or to a priest or a monk, or to the poor in any shape or form, in writing or without it. Later (A.D. 475) donations of every kind, "to the person of any martyr, or apostle, or prophet, or the holy angels," for building an oratory were made valid, even if the building were promised only and not begun; and the same rule applied to infirmaries (*noscomia*) and poor-houses (*ptocheia*)—the bishop or steward being competent to appear as plaintiff in such cases. Later, again, (A.D. 528) contributions of 50 solidi (say about £19.10s.) to a church, hostel (*xenodocheion*), &c., were made legal, though not registered; while larger sums, if registered, were also legalized. So (A.D. 529) property might be given for "churches, hostels, poor-houses, infant and orphan homes, and homes for the aged, or any such community" (*consortium*), even though not registered, and such property was free from taxation. The next year (530) it was enacted that prescription even for 100 years did not alienate Church and charitable property. The broadest interpretation was allowed. If by will a share of an estate was left "to Christ our Lord," the church of the city or other locality might receive it as heir; "let these, the law says, belong to the holy churches, so that they may become the alimony of the poor." It was sufficient to leave property to the poor (*Corpus Juris Civilis*, ed. Krueger, 1877, ii. 25). The bequest was legal. It went to the legal representative of the poor—the Church. Charitable property was thus Church property. The word "alms" covered both. It was given to pious uses, and as a kind of public institution "shared that corporate capacity which belonged to all ecclesiastical institutions by virtue of a general rule of law." On a *pia causa* it was not necessary to confer a juristic personality. Other laws preserved or regulated alienation (A.D. 477, A.D. 530), and checked negligence or fraud in management. The clergy had thus become the owners of large properties, with the *coloni* and slaves upon the estates and the allowances of civic corn (*annona civica*); and (A.D. 357) it was stipulated that whatever they acquired by thrift or trading should be used for the service of the poor and needy, though what they acquired from the labour of their slaves in the labour houses (*ergastula*) or inns (*tabernae*) might be considered a profit of religion (*religionis lucrum*).

Thus grew up the system of endowed charities, which with certain modifications continued throughout the Middle Ages, and, though it assumed different forms in connexion with guilds and municipalities, in England it still retains, partially at least, its relation to the Church. It remained

the system of institutional relief parallel to the more personal almsgiving of the parish.

Monasticism, in acting on men of strong character, endowed them with a double strength of will, and to men like St Gregory it seemed to give back with administrative power the relentless firmness of the Roman. In the East it produced the turbulent soldiery of the Church, in the West its missionaries; and each mission-monastery was a centre of relief.

In Benedictine monasteries, on the east side (see Smith's *Dict. Christian Antiq.*) of the quadrangle, separated from the rest of the house (cf. the guest arrangements) were the dormitory and kitchen of the strangers. A *hospitarius* attended to their needs and novices waited on them. Guests who were laymen might stay on, either taking the vow, or working in return for board and lodging. Usually the almonry was at the gate. (Cf. Dugdale, ii. 43, &c.) Also the monasteries were centres of local relief: thus, for instance (cf. Rule; St Dunst. *Cant. Archiep.* p. xlii. Dugdale), every day three of those who were continuously fed in the monastery were selected to share the food of the brothers.

But whatever the services monasticism rendered, it can hardly be said to have furthered true charity from the social standpoint, even if we include its institutional work.

The movement was necessarily anti-parochial, and thus out of sympathy with the charities of the parish, where personal relations with the poor at their homes count for most. In later times, not unfrequently, property and tithe which belonged to a parish and supported its church and priest were diverted to a monastery; and the clergy of the church first becoming *canonici*, or bound by rule, and then assuming the collegiate or monastic character, introduced the hybrid system of parochial management by monastic bodies. How far this was beneficial to the parish and the life and charities of the family is very doubtful. The good and evil may be weighed. Monasticism working through St Augustine helped the world to realize the mood of love as the real or eternal life. Of the natural life of the world and its responsibilities, through which that mood would have borne its completest fruit, it took but little heed, except in so far as, by creating a class possessed of leisure, it created able scholars, lawyers, and administrators, and disciplined the will of strong men. It had no power to stay the social evils of the day. Unlike the friars, at their best the monks were a class apart, not a class mixed up with the people. So were their charities. The belief in poverty as a fixed condition—irretrievable and ever to be alleviated without any regard to science or observation, subjected charity to a perpetual stagnation. Charity requires belief in growth, in the sharing of life, in the utility and nobility of what is done here and now for the hereafter of this present world. Monasticism had no thought of this. It was based on a belief in the evil of matter; and from that root could spring no social charity. Economic difficulties also fostered monasticism. Gold was appreciated in value, and necessities were expensive, and the cost of maintaining a family was great. It was an economy to force a son or a brother into the Church. The population was decreasing; and in spite of Church feeling Marjorian (A.D. 461) had to forbid women from taking the veil before forty, and to require the remarriage of widows, subject to a large forfeit of property (Hodgkin, *Italy and her Invaders*, ii. 420). Monasticism was inconsistent with the social good. As to the family—like the moderns who depreciate thrift and are careless of the life of the family, the monks, believing that marriage was a lower form of morality, if not indeed, as would at times appear, hardly moral at all, could feel hardly any enthusiasm for what is socially the very source of the health of the community and the well-spring of all charitable feeling. By the sacerdotal-monastic movement the moralizing force of Christianity was denaturalized. The falsity of its position revealed itself in unrecognized and degrading relations between men and women. But, worse than all, it pushed charity from its pivot. For this no monasteries or institutions, no domination of religious belief, could atone. The Church that had fostered chastity and marriage was betraying its trust. It was out of touch with the primal unit of social life, the child-school of dawning habits and the loving economy of the home. It produced no treatise on economy in the older Greek sense of the word. The home was nothing to it; and the popular worship of the family, the Holy Family, marks the reaction, expressing itself in the only way through which it could find an effective and untrammelled outlet, in a popular cult, which was, strictly speaking, inconsistent with the later tenets of the religion with which it could not but remain associated.

We may ask, then, What were the results of charity at the close of the period which ends with St Gregory and the

founding of the mediæval Church?—for if the charity is reflected in the social good, the results should be manifest. Economic and social conditions were adverse. With lessened trade the middle class was decaying (Dill, *Roman Society in the Last Century of the Western Empire*, p. 204) and a selfish aristocracy rising up. Municipal responsibility had been taxed to extinction. The public service was corrupt. The rich evaded taxation, the poor were oppressed by it. There were laws upon laws, endeavours to underpin the framework of a decaying society. Society was bankrupt of skill—and the skill of a generation has a close bearing on its charitable administration. While hospitals increased medicine was unprogressive. There were miserable years of famine and pestilence, and constant wars. The care of the poorer classes, and ultimately of the people, was the charge of the Church. The Church strengthened the feeling of kindness for those in want, widows, orphans, and the sick. It lessened the degradation of the “actresses,” and, co-operating with Stoic opinion, abolished the slaughter of the gladiatorial shows. It created a popular “dogmatic system and moral discipline,” which paganism failed to do; but it was unable to draw a new strength out of the patriotism of the Roman. It produced no prophet of charity, such as enlarged the moral imagination of the Jews. It ransomed slaves, as did paganism also, but it did not abolish slavery. Large economic causes produced one great reform. The serf attached to the soil took the place of the slave. The almsgiving of the Church by degrees took the place of *annona* and *sportula*, and it may have created pauperism. But dependence on almsgiving was at least an advance on dependence founded on a civic and hereditary right to relief. As the *colonus* stood higher than the slave, so did the pauper, socially at any rate, free to support himself, exceed the *colonus*. Bad economic conditions and traditions, and a bad system of almsgiving, might enthrall him. But the way, at least, was open; and thus it became possible that charity, working in alliance with good economic traditions, should in the end accomplish the self-support of society, the independence of the whole people.

PART V.—MEDIÆVAL CHARITY AND ITS DEVELOPMENT.

It remains to trace the history of thought and administration in relation to (1) the development of charitable responsibility in the parish, and the use of tithe and Church property for poor relief; and (2) the revision of the theory of charity, with which are associated the names of St Augustine (354-430), St Benedict (480-542), St Bernard (1091-1153), St Francis (1182-1226), and St Thomas Aquinas (1225-1274). (3) There follows, in reference chiefly to England, a sketch of the dependence of the poor under feudalism, the charities of the parish, the monastery, and the hospital—the mediæval system of endowed charity; the rise of guild and municipal charities; the decadence at the close of the 15th century, and the statutory endeavours to cope with economic difficulties which, in the 16th century, led to the establishment of statutory serfdom and the poor-laws. New elements affect the problem of charity in the 17th and 18th centuries; but it is not too much to say that almost all these headings represent phases of thought or institutions which in later forms are interwoven with the charitable thought and endeavours of the present day.

Naturally, two methods of relief have usually been prominent: relief administered locally, chiefly to residents in their own homes, and relief administered in an institution. At the time of Charlemagne (742-814) the system of relief was parochial, consisting principally of assistance at the home. After that time, except probably in England, the institu-

tional method appears to have predominated, and the monastery or hospital in one form or another gradually encroached on the parish.

The system of parochial charity was the outcome, apparently, of three conditions: the position and influence of the bishop, the eleemosynary nature of the church funds, and the need of some responsible organization of relief. It resulted in what might almost be called an ecclesiastical poor-law. The affairs of a local church or congregation were superintended by a bishop. To deal with outlying districts he detached priests for religious work and, as in Rome and (774) Strasburg, deacons also for the administration of relief. Originally all the income of the church or congregation was paid into one fund only, of which the bishop had charge, and this fund was available primarily for charitable purposes. Church property was the patrimony of the poor. In the 4th century (IV. Council of Carthage, 398) the names of the clergy were entered on a list (*matricula* or *canon*), as were also the names of the poor, and both received from the church their daily portion (cf. Ratzinger, *Geschichte der Kirchlichen Armenpflege*, p. 117). There were no expenses for building. Before the reign of Constantine (306) very few churches were built (Ratzinger, p. 120). Thus the early Church, as has been said, was chiefly a charitable society. By degrees the property of the Church was very largely increased by gifts and bequests, and in the West before St Gregory's time the division of it for four separate purposes—the support of the bishop, of the clergy, and of the poor, and for church buildings—still further promoted decentralization. Apart from any special gifts, there was thus created a separate fund for almsgiving, supervised by the bishop, consisting of a fourth of the church property, the oblations (mostly used for the poor), and the tithe, which at first was used for the poor solely. The cathedral city, or *civitas*, became the parish of the mother church—the bishop's parish; and there he attended to the poor personally. Around grew up neighbour parishes, of which the bishop had the supervision, and which were at first, or in some measure, supported from his funds, but which acquired by degrees tithe and property of their own. These parishes were endowed by Charlemagne. The priests were required to relieve the poor; and their “manses” were, as the word shows, halting-places where they had to provide food and lodging for strangers. The method was indeed elaborated and became, like the Jewish, that contradiction in terms—a compulsory system of charitable relief. The payment of tithe was enforced by Charlemagne, and it became a legal due (Counc. Francfort, 794; Arelat, 794). On the other hand, on the cathedral city (*civitas*) and the neighbouring priests (*vicani presbyteri*) was placed the obligation of relieving their own poor, so that they should not stray into other cities (II. Counc. Tours, 567). At the same time two other conditions were enforced. Each person (*unusquisque fidelium nostrorum* or *omnes cives*) was to keep his own family, i.e., all dependent on him—all, that is, upon his freehold estate (*allodium*); and all beggars were to be set to work. No one was to presume to give them relief (Charlem. *Capit.* v. 10). Thus we find here the germ of a poor-law system. As in the times of the *annona civica*, slavery, feudalism, or statutory serfdom, the burthen of the maintenance of the poor fell only in part on charity. Only those who could not be maintained as members of some “family” were properly entitled to relief—and in these circumstances the officially recognized clients of the Church consisted of the gradually decreasing number of free poor and those who were tenants of Church lands.

Since 817 there has been no universally binding decision of the Church respecting the care of the poor (Ratzinger, p. 236). So long ago did laicization commence in charity. In the wars and confusion of the 9th and 10th centuries the poorer freemen lapsed still further into slavery, or became *coloni* or bond servants; and later they passed under the feudal rule. Thus the Church's duty to relieve them became the masters' obligation to maintain them. Simultaneously the activity of the clergy, regular and secular alike, dwindled. They were exhorted to increase their alms. The revenues and property of “the poor” were largely turned to private or partly ecclesiastical purposes, or secularized. Legacies went wholly to the clergy, but only the tithe of the produce of their own lands was used for relief; and of the general tithe, only a third or fourth part was so applied. Eventually to a large extent, but more elsewhere than in England (Ratzinger, pp. 246, 269) the tithe itself was appropriated by nobles or even by the monasteries; and thus during and after the 10th century a new organization of charity was created on non-parochial methods of relief. Alms, with prayer and fasting, had always been connected with penance. But the character of the penitential system had altered. By the 7th century private penance had superseded the public and congregational penance of the earlier Church (*Dict. Christian Antiquities*, art. Penitence). To the penalties of exclusion from the sacraments or from the services of the Church or from its communion was coupled, with other penitential discipline, an elaborate

penitential system, in which about the 7th century the redemption of sin by the "sacrifice" of property, payments of money fines, &c., was introduced. (Cf. for instance Conc. Elberti:—Labbeus, i. 969 (A.D. 805), with Conc. Berghamstedense, Wilkins, Conc. p. 80 (A.D. 696), and the Penitential (p. 115) and Canons (A.D. 960), p. 236.) The same sin committed by an overseer (*præpositus paganus*) was compensated by a fine of 100 *solidi*; in the case of a *colonus* by a fine of 50. So amongst the ways of penitence were entered in the above-mentioned Canons, to erect a church, and if means allowed, add to it land . . . to repair the public roads . . . "to distribute," to help poor widows, orphans, and strangers, redeem slaves, fast, &c.—a combination of "good deeds" which suggests a line of thought such as ultimately found expression in the definition of charities in the Charities Act of Queen Elizabeth. The confessor, too, was "spiritualis medicus," and much that from the point of view of counsel would now be the work of charity would in his hands be dealt with in that capacity. For lesser sins (cf. Bede (673-735), *Hom.* 34, quoted by Ratzinger) the penalty was prayer, fasting, and alms; for the greater sins—murder, adultery, and idolatry—to give up all. Thus while half-converted barbarians may have been kept in moral subjection by material penances, the Church was enriched by their gifts; and these tended to support the monastic and institutional methods which were in favour, and to which, on the revival of religious earnestness in the 11th century, the world looked for the reform of social life.

To understand mediæval charity it is necessary to return to, St Augustine. According to him, the motive of man in his legitimate effort to assert himself in life was love or desire (*amor* or *cupido*). "All impulses were only evolutions of this typical characteristic" (Harnack, *History of Dogma* (trans.), v. iii.); and this was so alike in the spiritual and the sensuous life. Happiness thus depended on desire; and desire in turn depended on the regulation of the will; but the will was regulated only by grace. God was the *spiritualis substantia*; and freedom was the identity of the will with the omnipotent unchanging nature. This highest Being was "holiness working on the will in the form of omnipotent love." This love was grace—"grace imparting itself in love." Love (*caritas*—charity) is identified with justice; and the will, the good-will, is love. The identity of the will with the will of God was attained by communion with Him. The after-life consummated by sight this communion, which was here reached only by faith. Such a method of thought was entirely introspective, and it turned the mind "wholly to hope, asceticism, and the contemplation of God in worship." "Where St Augustine indulges in the exposition of practical piety he has no theory at all of Christ's work." To charity on that side he added nothing. In the 11th century there was a revival of piety, which had amongst its objects the restoration of discipline in the monasteries and a monastic training for the secular clergy. To this Augustinian thought led the way. "Christianity was asceticism and the city of God" (Harnack vi. 6). A new religious feeling took possession of the general mind, a regard and adoration of the actual, the historic Christ. Of this St Bernard was the expositor. "Beside the sacramental Christ the image of the historical took its place,—majesty in humility, innocence in penal suffering, life in death." The spiritual and the sensuous were intermingled. Dogmatic formulæ fell into the background. The picture of the historic Christ led to the realization of the Christ according to the spirit (*kata pneuma*). Thus St Bernard carried forward Augustinian thought; and the historic Christ became the "sinless man, approved by suffering, to whom the divine grace, by which He lives, has lent such power that His image takes shape in other men and incites them to corresponding humility and love."

Humility and poverty represented the conditions under which alone this spirit could be realized; and the poverty must be spiritual, and therefore self-imposed ("wifful," as it was afterwards called). This led to practical results.

Poverty was not a social state, but a spiritual; and consequently the poor generally were not the *pauperes Christi*, but those who, like the monks, had taken vows of poverty. From these premisses followed later the doctrine that gifts to the Church were not gifts to the poor, as once they had been, but to the religious bodies. The Church was not the Church of the poor, but of the poor in spirit. But the immediate effect was the belief for a time, apparently almost universal, that the salvation of society would come from the monastic orders. By their aid, backed by the general opinion, the secular clergy were brought back to celibacy and the monasteries newly disciplined. But charity could not thus regain its touch of life and be a means of raising the standard of social duty.

Next, one amongst many stirred by a kindred inspiration, St Francis turned back to actual life and gave a new reality to religious idealism. For him the poor were once again the *pauperes Christi*. To follow Christ was to adopt the life of "evangelical poverty," and this was to live among the poor the life of a poor man. The follower was to work with his hands (as the poor clergy of the early Church had done and the clergy of the early English Church were exhorted to do); he was to receive no money; he was to earn the actual necessities of life, though what he could not earn he might beg. To ask for this was a right, so long as he was bringing a better life into the world. All in excess of this he gave to the poor. He would possess no property, buildings, or endowments, nor was his order to do so. The fulness of his life was in the complete realization of it now, without the cares of property and without any fear of the future. Having a definite aim and mission, he was ready to accept the want that might come upon him, and his life was a discipline to enable him to suffer it if it came. To him humility was the soul making itself fit to love; and poverty was humility expanded from a mood to a life, a life not guarded by seclusion, but spent amongst those who were actually poor. The object of life was to console the poor—those outside all monasteries and institutions—the poor as they lived and worked. The movement was practically a lay movement, and its force consisted in its simplicity and directness. Book learning was disparaged: life was to be the teacher. The brothers thus became observant and practical, and afterwards indeed learned, and their learning had the same characteristics. Their power lay in their practical sagacity, in their treatment of life, outside the cloister and the hospital, at first hand. They knew the people because they settled amongst them, living just as they did. This was their method of charity.

The inspiration that drew St Francis to this method was the contemplation of the life of Christ. But it was more than this. The Christ was to him, as to St Bernard, an ideal, whose nature passed into that of the contemplating and adoring beholder, so that, as he said, "having lost its individuality, of itself the creature could no longer act." He had no impulse but the Christ impulse. He was changed. His identity was merged in that of Christ. And with this came the conception of a gracious and finely ordered charity, moving like the natural world in a constant harmonious development towards a definite end. The mysticism was intense, but it was practical because it was intense. In that lay the strength of the movement of the true Franciscans, and in those orders that, whether called heretical or not, followed them—Lollards and others. Religion thus became a personal and original possession. It became individual. It was inspired by a social endeavour, and for the world at large it made of charity a new thing.

St Thomas Aquinas took up St Bernard's position. Renunciation of property, voluntary poverty, was in his view

also a necessary means of reaching the perfect life; and the feeling that was akin to this renunciation and prompted it was charity. "All perfection of the Christian life was to be attained according to charity," and charity united us to God.

In the system elaborated by St Thomas Aquinas two lines of thought are wrought into a kind of harmony. The one stands for Aristotle and nature, the other for Christian tradition and theology. We have thus a duplicate theory of thought and action throughout both rational and theologic virtues, and a duplicate beatitude or state of happiness correspondent to each. On the one hand it is argued that the good act is an act which, in relation to its object, wholly serves its purpose; and thus the measure of goodness (*Prima Secundæ Summæ Theolog. Q. xviii. 2*) is the proportion between action and effect. On the other hand, the act has to satisfy the twofold law, human reason and eternal reason. From the point of view of the former the cardinal factor is desire, which, made proportionate to an end, is love (*amor*); and, seeking the good of others, it loses its quality of concupiscence and becomes friendly love (*amor amicitie*). But this rational love (*amor*) and charity (*caritas*), the theologic virtue, may meet. All virtue or goodness is a degree of love (*amor*), if by virtue we mean the cardinal virtues and refer to the rule of reason only. But there are also theologic virtues, which are on one side "essential," on the other side participative. As wood ignited participates in the natural fire, so does the individual in these virtues (*II. II. lxii. 1*). Charity is a kind of friendship towards God. It is received *per infusionem spiritus sancti*, and is the chief and root of the theologic virtues of faith and hope, and on it the rational virtues depend. They are not degrees of charity as they are of (*amor*) love, but charity gives purpose, order, and quality to them all. In this sense the word is applied to the rational virtues—as, for instance, beneficence. The counterpart of charity in social life is pity (*miser cordia*), the compassion that moves us to supply another's want (*summa religionis Christianæ in misericordia consistit quantum ad exteriora opera*). It is, however, an emotion, not a virtue, and must be regulated like any other emotion (*... passio est et non virtus. Hic autem motus potest esse secundum rationem regulatus, II. II. xxx. 3*). Thus we pass to alms, which are the instrument of pity—an act of charity done through the intervention of pity. The act is not done in order to purchase spiritual good by a corporal means, but to merit a spiritual good (*per effectum caritatis*) through being in a state of charity; and from that point of view its effect is tested by the recipient being moved to pray for his benefactor. The claim of others on our beneficence is relative, according to consanguinity and other bonds (*II. II. xxxi. 3*), subject to the condition that the common good of many is a holier obligation (*divinius*) than that of one. Obedience and obligation to parents may be crossed by other obligations, as, for instance, duty to the Church. To give alms is a command. Alms should consist of the superfluous—that is, of all that the individual possesses after he has reserved what is necessary. What is necessary the donor should fix in due relation to the claims of his family and dependants, his position in life (*dignitas*), and the sustenance of his body. On the other hand, his gift should meet the actual necessities of the recipient and no more. More than this will lead to excess on the recipient's part (*ut inde luatur*) or to want of spirit and apathy (*ut alius remissio et refrigerium sit*), though allowance must be made for different requirements in different conditions of life. It were better to distribute alms to many persons than to give more than is necessary to one. In individual cases there remains the further question of correction—the removing of some evil or sin from another; and this, too, is an act of charity.

It will be seen that though St Thomas bases his argument on a duplicate theory of thought, action, and happiness, part natural, part theologic, and states fully the conditions of good action, he does not bring the two into unison. Logically the argument should follow that alms that fail in social benefit (produce *remissionem et refrigerium*, for instance) fail also in spiritual good, for the two cannot be inconsistent. But in regard to the former he does not press the importance of purpose, and, in spite of his Aristotle, he misses the point on which Aristotle, as a close observer of social conditions, insists, that gifts without purpose and reciprocity foster the dependence they are designed to meet. The proverb of the "pierced cask" is as applicable to ecclesiastical as to political almsgiving, as has often been proved by the event. The distribution of all "superfluous" income in the form of alms would have the effect of a huge endowment, and would stereotype "the poor" as a permanent and unprogressive class. The proposal suggests that St Thomas contemplated the adoption of a method of relief which would be like a voluntary poor-law; and it is noteworthy that his phrase "necessary relief" forms the defining words of the Elizabethan poor-law, while he also lays stress on the importance of "correction," which, on the decline

and disappearance of the penitential system, assumed at the Reformation a prominent position in administration in relation not only to "sin," but also to offences against society, such as idleness, &c.

On this foundation was built up a classification of acts of charity, which St Thomas quotes—the seven spiritual acts (*consule, carpe, doce, solare, remitte, fer, ora*), counsel, sustain, teach, console, save, pardon, pray; and the seven corporal (*vestio, poto, cibo, redimo, tego, colligo, condo*), I clothe, I give drink to, I feed, I free from prison, I shelter, I assist in sickness, I bury (*II. II. xxxii. 2*). These in subsequent thought became "good works," and availed for the after-life, bringing with them definite boons. Thus charity was linked to the system of indulgences. The bias of the act of charity is made to favour the actor. Primarily the benefit reverts to him. He becomes conscious of an ultimate reward accruing to himself. The simplicity of the deed, the spontaneity from which, as in a well-practised art, its freshness springs and its good effects result, is falsified at the outset. The thought that should be wholly concerned in the fulfilment of a definite purpose is diverted from it. The deed itself, apart from the outcome of the deed, is highly considered. An extreme inducement is placed on giving, counselling, and the like, but none on the personal or social utility of the gift or counsel. Yet the value of these lies in their end. No policy or science of charity can grow out of such a system. It can produce innumerable isolated acts, which may or may not be beneficent, but it cannot enkindle the "ordered charity." This charity is, strictly speaking, by its very nature alike intellectual and emotional. Otherwise it would inevitably fail of its purpose, for though emotion might stimulate it, intelligence would not guide it.

There are, then, these three lines of thought. That of St Bernard, who invigorated the monastic movement, and helped to make the monastery or hospital the centre of charitable relief. That of St Francis, who, passing by regular and secular clergy alike, revived and reinvigorated the conception of charity and gave it once more the reality of a social force, knowing that it would find a freer scope and larger usefulness in the life of the people than in the religious aristocracy of monasteries. And that of St Thomas Aquinas, who, analysing the problem of charity and almsgiving, and associating it with definite groups of works, led to its taking, in the common thought, certain stereotyped forms, so that its social aim and purpose were ignored and its power for good was neutralized.

We have now to turn to the conditions of social life in which these thoughts fermented and took practical shape. The population of England from the Conquest to the 14th century is estimated at between 1½ and 2½ millions. London, it is believed, had a population of about 40,000. Other towns were small. Two or three of the larger had 4000 or 5000 inhabitants. The only substantial building in a village, apart perhaps from the manor-house, was the church, used for many secular as well as religious purposes. In the towns the mud or wood-paved huts sheltered a people who, accepting a common poverty, traded in little more than the necessities of life (Green, *Town Life in the 15th Century*, i. 13). The population was stationary. Famine and pestilence were of frequent occurrence (Creighton, *Epidemics in Britain*, p. 19), and for the careless there was waste at harvest time and want in winter. Hunger was the drill-sergeant of society. Owing to the hardship and penury of life infant mortality was probably very great. The 15th century was, however, "the golden age of the labourer." Our problem is to ascertain what was the service of charity to this people

Charity and social conditions in England.

till the end of that century. In order to estimate this we have to apply tests similar to those we applied before to Greece and Rome and the pre-mediæval Church.

The Family.—Largely Germanic in its origin, we may perhaps set down as elemental in the English race what Tacitus said of the Germans. They had the home virtues. They had a high regard for chastity, and respected and enforced the family tie. The wife was honoured. The men were poor, but when the actual pressure of their work—fighting—was removed, idle. They were born gamblers. Much toil fell upon the wife; but slavery was rather a form of tenure than a Roman bondage. As elsewhere, there was in England “the joint family or household” (Pollock and Maitland, *English Law before Edward I.* i. 31). Each member of the community was, or should be, under some lord; for the lordless man was, like the wanderer in Homer, who belonged to no phratry, suspected and dangerous, and his kinsfolk might be required to find a lord for him. There was personal servitude, but it was not of one complexion; there were grades amongst the unfree, and the general advance to freedom was continuous. By the 9th century the larger amount of the slavery was bondage by tenure. In the reign of Edward I., though “the larger half of the rural population was unfree,” yet the serf, notwithstanding the fact that he was his lord’s chattel, was free against all save his lord. A century later (1381) villanage—that is payment for tenancy by service, instead of by quit-rent—was practically extinguished. So steady was the progress towards the freedom and self-maintenance of the individual and his family.

The Manor.—In social importance, next to the family, comes the manor, the organization of which affected charity greatly on one side. It was “an economic unit,” the estate of a lord, on which there were associated the lord with his demesne, tenants free of service, and villans and others, tenants by service. All had the use of land, even the serf. The estate was regulated by a manor court, consisting of the lord of the manor or his representative, and the free tenants, and entrusted with wide quasi-domestic jurisdiction. The value of the estate depended on the labour available for its cultivation, and the cultivators were the unfree tenants. Hence the lord, through the manor-court, required an indemnity or fine if a child, for instance, left the manor; and similarly, if a villan died, his widow might have to remarry or pay a fine. Thus the lord reacquired a servant and the widow and her family were maintained. The courts, too, fixed prices, and thus in local and limited conditions of supply and demand were able to equalize them in a measure and neutralize some of the effects of scarcity. In this way, till the reign of Edward I., and, where the manor courts remained active, till much later, a self-supporting social organization made any systematic public or charitable relief unnecessary.

The Parish and the Tithe.—The conversion of England in the 7th century was effected by bishops, accompanied by itinerant priests, who made use of conventual houses as the centres of their work. The parochial system was not firmly established till the 10th century (970). Then, by a law of Edgar, a man who had a church on his own land was allowed to pay a third of his tithe to his own church, instead of giving the whole of it to the minister or conventual church. Theodore, archbishop of Canterbury (667), had introduced the Carlovingian system into England; and, accordingly, the parish priest was required to provide for strangers and to keep a room in his house for them. Of the tithe, a third and not a fourth was to go to the poor with any surplus; and in order to have larger means of helping them, the priests were urged to work themselves, according to the ancient canons of the Church (cf. Labbeus, IV. Conc. Carthag. A.D. 393). The importance of the tithe to the poor is shown by Acts of Richard II. and Henry IV., by which it was enacted that, if parochial tithes were appropriated to a monastery, a portion of them should be assigned to the poor of the parish. At a very early date (1287) the parish became the area for a quasi-compulsory rate (Pollock and Maitland, p. 614), though in the 14th and 15th centuries a church rate was seldom made. Collections were made by paid collectors, especially for Hoke money—money gathered for church purposes (Brand’s *Antiquities*, p. 112). There were also from endowments parish doles, very many of which must have disappeared in the break-up of the 16th century. All the greater festivals were days of feasting and the distribution of food; at funerals also there were often large distributions, and also at marriages. The faithful generally, subject to penance, were required to relieve the poor and the stranger. In the larger part of England the parish and the vill were usually coterminous. In the north a parish contained several vills. There were thus side by side the charitable relief system of the parish, which at an early date became a rating area, and the self-supporting system of the manor.

The Monasteries.—As Christianity spread monasteries spread,

and each monastery was a centre of relief. Sometimes they were established, like St Albans (796), for a hundred Benedictine monks and for the entertainment of strangers; or sometimes without any such special purpose, like the abbey of Croyland (re-organized 946), which, becoming exceedingly rich from its *diversorium pauperum*, or almonry, “relieved the whole country round so that prodigious numbers resorted to it.” But documents seem to prove (Denton, *England in Fifteenth Century*, p. 245) that the relief generally given by monasteries was much less than is usually supposed. Often they distributed relief at the homes of the poor, provided accommodation for the sick, and established hospitals, which served also as schools for the gentry and for the poor; and they were pioneers of agriculture. In the 12th century, in which many monastic orders were constituted, there were many lavish endowments. In the 14th century their usefulness had begun to wane. At the end of that century the larger estates were generally held in entail, with the result that younger sons were put into religious houses. This worldliness had its natural consequences. In the 15th century, owing to mismanagement, waste, and subsequently to the decline of rural prosperity, their resources were greatly crippled. In their relation to charity one or two points may be noted: (1) Of the small population of England the professed monks and nuns with the parish priests (Rogers, *Hist. Agric. and Prices*, i. 58) numbered at least 30,000 or 40,000. This number of celibates was a standing protest against the moral sufficiency of the family life. On the other hand, amongst them were the brothers and sisters who visited the poor and nursed the sick in hospitals; and many who now succumb physically or mentally to the pressure of life, and are cared for in institutions, may then have found maintenance and a retreat in the monasteries. (2) Bound together by no common controlling organization, the monasteries were but so many miscellaneous centres of relief, chiefly casual relief. They were mostly “magnificent hostelries.” (3) They stood outside the parish, and they weakened its organization and hampered its development.

The Hospitals.—The revival of piety in the 11th century led to a large increase in the number of hospitals and hospital orders. To show how far they covered the field in England two instances may be quoted. At Canterbury (Creighton, p. 87) there were four for different purposes, two endowed by Lanfranc (1084), one for poor, infirm, lame, and blind men and women, and one outside the town for lepers. These hospitals were put under the charge of a priory, and endowed out of tithes payable to the secular clergy. Later (Henry II.) a hospital for leprosy sisters was established, and afterwards a hospital for leprosy monks and poor relations of the monks of St Augustine’s. In a less populous parish, Luton (Cobbe, *Luton Church*), there were a hospital for the poor, an almshouse, and two hospitals, one for the sick and one for the leprosy. The word “leper,” it is evident, was used very loosely, and was applied to many diseases other than leprosy. There were hospitals for the infirm and the leprosy; the disease was not considered contagious. The hospital in its modern sense was but slowly created. Thus St Bartholomew’s in London was founded (1123) for a master, brethren, and sisters, and for the entertainment of poor diseased persons till they got well; of distressed women big with child till they were able to go abroad; and for the maintenance, until the age of seven, of all such children whose mothers died in the house. St Thomas’s (rebuilt 1228) had a master and brethren, and three lay sisters, and 40 beds for poor, infirm, and impotent people, who had also victual and firing. There were hospitals for many special purposes—as for the blind, for instance. There were also many hospital orders in England and on the Continent. They sprang up beside the monastic orders, and for a time were very popular: brothers and sisters of the Holy Ghost (1198), sisters of St Elizabeth (1207-1231), Beguins and Beghards (about 1175), knights of St John, and others.

The Mendicant Orders.—The Franciscans tended the sick and poor in the slums of the towns with great devotion—indeed, the whole movement tells of a splendid self-abandonment and an intensity of effort in the early spring of its enthusiasm—and with the aid of reform councils and reformations it lengthened out its usefulness for two centuries.

As in the pre-mediæval Church, the system of relief is that of charitable endowments—a marked contrast to the modern method of voluntary associations or rate-supported institutions.

*Mediæval
endowed
charities.*

(1) *The Church as Legatee.*—The church building among the Teutonic races was not held by the bishop as part of what was originally the charitable property of the Church. It was assigned to the patron saint of the church by the donor, who retained the right of administration, of which his own patronage or right of presentation is a relic. Subsequently, with the study of Roman law, the conception of the Church as a *persona ficta* prevailed; and till the larger growth of the guilds and corporations

it was the only general legatee for charitable gifts. As these arise a large number of charitable trusts are created and held by lay corporations; and "alms" include gifts for social as well as religious or eleemosynary purposes. (2) *Freedom from Taxation and Service*.—Gifts to the Church for charitable or other purposes were made in free, pure, and perpetual alms ("ad tenendum in puram et perpetuam eleemosynam sine omni temporali servicio et consuetudine"). Land held under this *frankalmoigne* was given "in perpetual alms," therefore the donor could not retract it; in free alms, therefore he could exact no services in regard to it; and in pure alms as being free from secular jurisdiction (cf. Pollock and Maitland). (3) *Alienation and Mortmain*.—To prevent alienation of property to religious houses, with the consequent loss of service to the superior or chief lords, a license from the chief lord was required to legalize the alienation (*Magna Carta*, and Edw. I., *De viris religiosis*). Other statutes (Edw. I. and Rich. II.) enacted that this license should be issued out of Chancery after investigation; and the principle was applied to civil corporations. The necessity of this license was one lay check on injurious alienation. (4) *Irresponsible Administration*.—Until after the 18th century, when the lay courts had asserted their right to settle disputes as to lands held in alms, the administration of charity was from the lay point of view entirely irresponsible. It was outside the secular jurisdiction; and civilly the professed clergy, who were the administrators, were "dead." They could not sue or be sued except through their sovereign—their chief, the abbot. They formed a large body of non-civic inhabitants free from the pressure and the responsibilities of civil life. (5) *Control*.—Apart from the control of the abbot, friar, master, or other head, the bishop was visitor, or, as we should say, inspector; and abuses might be remedied by the visit of the bishop or his ordinary. The bishop's ordinary (2 Henry V. i. 1) was the recognized visitor of all hospitals apart from the founder. The founder and his family retained a right of intervention. Sometimes thus an institution was reorganized, or even dissolved, the property reverting to the founder (Dugdale, *Monasticon Anglicanum*, vi. 2. 715). (6) *Cy-près*.—Charities were, especially after Henry V.'s reign, appropriated to other uses, either because their original purpose failed or because some new object had become important. Thus, for instance, a college or hospital for lepers (1363) is re-established by the founder's family with a master and priest, *quod nulli leprosi reperiebantur*; and a similar hospital founded in Henry I.'s time near Oxford has decayed, and is given by Edward III. to Oriel College, Oxford, to maintain a chaplain and poor brethren. Thus, apart from alienation pure and simple, the principle of adaptation to new uses was put in force at an early date, and supplied many precedents to Wolsey, Edward VI., and the post-Reformation bishops. The system of endowments was indeed far more adaptable than it would at first sight seem to have been. (7) *The Sources of Income*.—The hospitals were chiefly supported by rents or the produce of land; or, if attached to monasteries, out of the tithe of their monastic lands or other sources of revenue, or out of the appropriated tithes of the secular clergy; or they might be in part maintained by collections made, for instance, by a commissioner duly authorized by a formal attested document, in which were recounted the indulgences by popes, archbishops, and bishops to those who become its benefactors (Cobbe, p. 75); or, in the case of leper hospitals, by a leper with a "clapdish," who begged in the markets; or by a proctor, in the case of more important institutions in towns, who "came with his box one day in every month to the churches and other religious houses, at times of service, and there received the voluntary gifts of the congregation"; or they might receive inmates on payment, and thus apparently a frequent abuse, decayed servants of the court and others, were "farmed out." (8) *Mode of Admission*.—The admission was usually, no doubt, regulated by the prior or master. At York, at the hospital of St Nicholas for the leprous, the conditions of admission were: promise or vow of continence, participation in prayer, the abandonment of all business, the inmate's property at death to go to the house. This may serve as an example. The master was usually one of the regular clergy. (9) *Decline of the Hospitals*.—It is said that, in addition to 645 monasteries and 90 "colleges" and many chantries, Henry VIII. suppressed 110 hospitals (Speed's *Chronicle*, p. 778). The numbers seem small. In the economic decline at the end of the 15th and beginning of the 16th centuries many hospitals may have lapsed.

In the 15th century the towns grew in importance. First the wool trade and then the cloth trade flourished, and the English developed a large shipping trade. The towns grew up like "little principalities"; and for the advancement of trade, guilds, consisting alike of masters and workmen, were formed, which endeavoured to regulate and then to monopolize the market. By degrees the corporations of the towns were worked in their interests, and the whole commercial system became restrictive and inadapted. Meanwhile the towns attracted newcomers; freedom from feudal obligations was gained with com-

parative ease; and a new *plebs* was congregating, a population of inhabitants not qualified as burghers or guild members, women, sons living with their fathers, menial servants, and apprentices. There was thus an increasing restriction imposed on trade, coupled with a growing *plebs*. Naturally, then, lay charities sprang up for members of guilds, and for burghers and for the commonalty. Men left estates to their guilds to maintain decayed members, to educate their children, portion their daughters, and assist their widows. The middle-class trader was thus in great measure insured against the risks of life; and so large a stake did these guilds hold in the country that it has been argued (Rogers, iv. 5) that if they had been preserved instead of abolished in Edward VI.'s reign the enactment of Queen Elizabeth's poor-law might have been unnecessary. They were one sign of the new temper and wants of burghers freed from feudalism. Another sign was a new standard of manners. Rules and saws, Hesiodic in their tone, became popular,—in regard, for instance, to such a question as "how to enable a man to live on his means, and to keep himself and those belonging to him." The boroughs established other charities also, hospitals and almshouses for the people, a movement which, like the guilds, began very early—in Italy as early as the 9th century. They sometimes gave outdoor relief also to registered poor (Green, i. 41), and they had in large towns courts of orphans presided over by the mayor and aldermen, thus taking over a duty that previously had been one of conspicuous importance in the Church. As early as 1257 in Westphalian towns there was a rough-and-ready system of Easter relief of the poor; and in Frankfurt in 1437 there was a town council of almoners with a systematic programme of relief (Ratzinger, p. 352). Thus at the close of the Middle Ages the towns were gradually assuming what had been charitable functions of the Church.

While a new freedom was being attained by the labourer in the country and the burgher in the town, the difficulty of obtaining a sufficient supply of labour for agriculture must have been constant, especially **Statutory serfdom.** at every visitation of plague and famine. The state accordingly stepped in as arbiter and organizer. By Statutes of Labourers beginning in 1351 it aimed at enforcing a settled wage and restraining migration. From 1388 it endeavoured to suppress mendicity, and in part to systematize it in the interest of infirm and aged mendicants. Each series of enactments is the natural complement of the other. In the main their signification, from the point of view of charity, lies in the fact that they represent a persistent endeavour to prevent social unsettlement, and in part the distress which unsettlement causes, and which vagrancy in some measure indicates, by keeping the people within the ranks of recognized dependence, or forcing them back into it by fear of the gaol or the stocks. The extreme point of this policy was reached when by the laws of Edward VI. and Elizabeth, possibly founded on Byzantine edicts, the despairing legislator offered to give the mendicant as a slave or bondman for a period to any one who would take him. On the other hand, it was desired that relief should be a means of preventing migration. In any time of general pressure there is a desire to organize mendicity, to prevent the wandering of beggars, to create a kind of settled poor, distinguished from the rest as infirm and not able-bodied, and to keep these at least at home sufficiently supported by local and parochial relief; and this, in its simpler form all the world over, has in the past been by response to public begging. The argument may be summed up thus: We cannot have begging, which implies that the beggar is cared for by no one, belongs to no one, and therefore throws himself on the world at large. Therefore, if he is able-bodied he must be punished as unsocial, for it is his fault that he belongs to no one; or we must make him some one's dependant, and so keep him; or if he is infirm, and therefore of no service to any one—if no one will keep him—we must organize his mendicity, for such mendicity is justified. If he cannot dig for the man to whom he does or should belong, he must beg. Then out of the failure to organize mendicity—for relief of itself is no remedy, least of all casual relief—a poor-law springs up, which, after-

wards associated with the provision of employment, will, it is hoped, make relief in some measure remedial by increasing its quantity by means of compulsory levies. This argument, which combined statutory serfdom and statutory poor relief, seems to have been firmly bedded in the English legislative mind for more than two centuries, from 1381 till after 1600; and until 1834 these two series of laws effectually reduced the English labourer to a new serfdom. To people imbued with ideas of feudalism the way of escape from villanage seemed to be not independence, but a new reversion to it.

Many elements produced the social and economic catastrophe of the 16th century, for the condition into which the country fell can hardly be considered less than a catastrophe. With the growing independence of the people there was created after the 13th century an unsettled "masterless" class, a residue of failure resulting from social changes, which was large and important enough to call for legislation. In the 15th century, "the golden age of the English labourer," the towns increased and flourished. Both town and country did well. At the end of the century came the decadence. The measure of the strain, when perhaps it had reached its lowest level, is indicated by the following comparison: "The cost of a peasant's family of four in the early part of the 14th century was £3, 4s. 9d.; after 1540 it was £8" (Rogers, iv. 756).

The cause of this has now been fairly investigated. The value of land in the 13th century generally depended chiefly on "the head of labour" retained upon it. Its fertility depended on manure (manure). To keep labour upon it was therefore the aim of the lord or owner. The enclosing of lands for sheep began early, and in the time of Edward III., in the great days of the wool staple, must have been extensive. So long as the demand for the exportation of wool, and then for its consumption at home in the cloth trade, continued, the towns prospered, and the enclosures did not become a grievance. Even before the reign of Henry VII., with the decay of trade, the towns decayed, and their population in some cases diminished extraordinarily. This reacted on the country, where the great families had already become impoverished and were hardly able to support their retainers. In Henry VIII.'s time the lands of the religious houses were confiscated. Worked on old lines, the custom of tillage remained in force on them. Accordingly, when these estates fell into private hands they were transferred subject to the condition that they should be tilled as heretofore. The condition was evaded by the new owners, and the disbandment of farm labourers went on apace. In England and Wales these changes, it is said, affected a third of the country, more than 12,000,000 acres, if the estimates be correct, or rather a third of the best land in the kingdom. With towns decaying the effect of this must have been terrible. What were really "latifundia" were created, "great landes," "enclosures of a mile or two or thereabouts . . . destroying thereby not only the farms and cottages within the same circuits, but also the towns and villages adjoining." A herdsman and his wife took the place of eighteen to twenty-four farm hands. The people thus set wandering could only join the wanderers from the decaying towns. At the same time the economic difficulty was aggravated by a new patrician or commercial greed; and once more the land question—the absorption of property into a few hands instead of its free exchange—led to lasting social demoralization. A few years after the alienation of the monasteries the coinage (1543) was debased. By this means prices were arbitrarily raised, and wages were increased nominally; but nevertheless the price of necessities was "so enhanced" that neither "the poor labourers can live with their wages that is limited by your grace's laws, nor the artificers can make, much less sell, their wares at any reasonable price" (Lamond, *The Commonwealth of this Realm of England*, p. xlvii.). No social reformation, such as the charitable instincts of More, Hales, Latimer, and other men suggested, was attempted, or at least persistently carried out. In towns the organization of labour had become restrictive, exclusive, and inadaptably, or, judged from the moral standpoint, uncharitable. There had been a time of plenty and extravagance, of which in high quarters the famous "field of the cloth of gold" was typical; and probably, in accordance with the frequently observed law of social economics, as the advance in wages and their purchasing power in the earlier part of the 15th century had not been accompanied by a simultaneous advance in self-discipline and intelligent expenditure, it resulted in part in

lessened competence and industrial ability on the part of the workmen, and thus in the end produced pauperism.

The poverty of the country was very great in the reigns of Edward VI. and Elizabeth. Adversity then taught the people new manners, and households became more simple and thrifty. In the reign of James I., with enforced economy and thrift, a "slow but substantial improvement in agriculture" took place, and a new growth of commercial enterprise. The vigour of the municipalities had abated, so that in Henry VIII.'s time they had become the very humble servants of the Government; and the Government, on the other hand, had become strongly centralized—in itself a sign of the general withdrawal of self-sustaining activity in all administration, in the administration of charitable relief no less than in other departments. A system of endowed charities had been built up, supported chiefly by rents from landed property. These now had disappeared, and thus the means of relief, which Edward VI. and Queen Elizabeth might have utilized at a time of general distress, had been dissipated by the acts of their predecessors. The civil independence of the monasteries and religious houses might have been justified, possibly, when they were engaged in missionary work and were instilling into the people the precepts of a higher moral law than that which was in force around them. But afterwards, as the ability and intelligence of the community increased, their privileges became more and more antagonistic to charity, and tended to create a non-social, and even anti-social, ecclesiastical democracy actuated by aims and interests in which the general good of the people had little or no place. There was a growing alienation between religious tradition and secular opinion, as Lollardism slowly permeated the thought of the people and led the way to the Reformation. While this alienation existed no national system of charity, civic and yet religious, could be created. But worse than all, the ideal of charity had been degraded. A self-regarding system of relief had superseded charity, and it was productive of nothing but alms, large or small, isolated and unmethodic, given with a wrong bias, and thus almost inevitably with evil results. Out of this could spring no vigorous co-operative charity. Charity—not relief—indeed seemed to have left the world. The larger issues were overlooked. Then the property of the hospitals and the guilds was wantonly confiscated, though the poor had already lost that share in the revenues of the Church to which at one time they were admitted to have a just claim. A new beginning had to be made. The obligations of charity had to be revived. A new organization of charitable relief had to be created, and that with an empty exchequer and after a vast waste of charitable resources. There were signs of a new congregational and parochial energy, yet the task could not be entrusted to the religious bodies, divided and disunited as they were. In their stead it could only be imposed on some authority which represented the general community, such as municipalities; and in spite of the centralization of the Government there seemed some hope of creating a system of relief in connexion with them. They were tried, and, very naturally, failed. In the poverty of the time it seemed that the poor could be relieved only by a compulsory rate, and the administration of statutory relief naturally devolved on the central Government—the only vigorous administrative body left in the country. The Government might indeed have adopted the alternative of letting the industrial difficulties of the country work themselves out, but they had inherited a policy of minute legislative control, and they continued it. Revising previous statutes, they enacted the Poor Law, which still remains on our statute book. It could be no remedy for social offences

against charity and the community. But in part at least it was successful. It helped to conceal the failure to find a remedy.

PART VI.—AFTER THE REFORMATION.

During the Reformation, which extended, it should be understood, from the middle of the 14th century to the reign of James I., the groundwork of the theory of charity was being recast. The old system and the narrow theory on which it had come to depend were discredited. The recoil is startling. To a very large extent charitable administration had been in the hands of men and women who, as an indispensable condition to their participation in it, took the vows of obedience, chastity, and "wilful" poverty. Now this was all entirely set aside. It was felt (see *Homilies on Faith and Good Works*, &c., A.D. 1547) that socially and morally the method had been a failure. The vow of obedience, it was argued, led to a general disregard of the duties of civic and family life. Those who bound themselves by it were outside the state and did not serve it. In regard to chastity the *Homily* states the common opinion: "How the profession of chastity was kept, it is more honesty to pass over in silence and let the world judge of what is well known." As to wilful poverty, the regulars, it is urged, were not poor, but rich, for they were in possession of much wealth. Their property, it is true, was held *in communi*, and not personally, but nevertheless it was practically theirs, and they used it for their personal enjoyment; and "for all their riches they might never help father nor mother, nor others that were indeed very needy and poor, without the license of their father abbot" or other head. This was the negative position. The positive was found in the doctrine of justification—the central point in the discussions of the time, a plant from the garden of St Augustine. Justification was the personal conviction of a lively (or living) faith, and was defined as "a true trust and confidence of the mercy of God through our Lord Jesus Christ, and a stedfast hope of all good things to be received at His hands." Without this justification there could be no good works. They were the signs of a lively faith and grew out of it. Apart from it, what seemed to be "good works" were of the nature of sin, phantom acts productive of nothing, "birds that were lost, unreal." So were the works of pagans and heretics. The relation of almsgiving to religion was thus entirely altered. The personal reward here or hereafter to the actor was eliminated. The deed was good only in the same sense in which the doer was good; it had in itself no merit. This was a great gain, quite apart from any question as to the sufficiency or insufficiency of the Protestant scheme of salvation. The deed, it was realized, was only the outcome of the doer, the expression of himself, what he was as a whole, neither better nor worse. Logically this led to the discipline of the intelligence and the emotions, and undoubtedly "justification" to very many was only consistent with such discipline and implied it. Thus under a new guise the old position of charity reasserted itself. But there were other differences.

The relation of charity to prayer, fasting, almsgiving, and penance was altered. The prayerful contemplation of the Christ is preserved in the mysticism of Protestantism; but it is dissociated from the "historic Christ," from the fervent idealization of whom St Francis drew his inspiration and his active charitable impulse. The tradition did not die out, however. It remained with many, notably with George Herbert, of whom it made, not unlike St Francis, a poet as well as a practical parish priest; but the absence of it indicated in much post-Reformation endeavour a want, if not of devotion, yet of intensity of feeling which may in part account for the fact that sectarianism in relief has since proved itself stronger than charity, instead of yielding to charity

as its superior and its organizer. Fasting was parted from prayer and almsgiving. It was "a thing not of its own proper nature good as the love of father or mother or neighbour, but according to its end." Almsgiving also as a "work" disappears, and with it a whole series of inducements that from the standpoint of the pecuniary and material supply of relief had long been active. It was no wonder that the preachers advocated it in vain, and reproached their hearers with their diminished bounty to the poor; the old personal incentive had gone, and could only gradually be superseded by the spontaneous activity of personal religion very slowly wedding itself to true views of social duty and purpose. Penance, once so closely related to almsgiving, passes out of sight. Charity, the love of God and our neighbour, had two offices, it was said, "to cherish good and harmless men," and "to correct and punish vice without regard to persons." Correction as a means of discipline takes the place of penance, and it becomes judicial, regulating and controlling church membership by the authority of the church, a congregation, minister, or elder; or dealing with laziness or ill-doing through the municipality or state, in connexion with what now first appear, not prisons, but houses of correction.

The religious life was to be democratic—not in religious bodies, but in the whole people; and in a new sense—in relation to family and social life—it was to be moral. That was the significance of the Reformation for charity.

Consistently with this movement of religious activity towards a complete fulfilment of the duties of civic life, the older classical social theory, fostered by the Renaissance, assumed a new influence—the great conception of the state as a community bound together by charity and friendship. "We be not born to ourselves," it was said, "but partly to the use of our country, of our parents, of our kinsfolk, and partly of our friends and neighbours; and therefore all good virtues are grafted on us naturally, whose effects be to do good to others, when it showeth forth the image of God in man, whose property is ever to do good to others" (Lamond, p. 14). Economic theory also changed. Instead of the mediæval opinion of the "theologian or social preacher," that "trade could only be defended on the ground that honestly conducted it made no profit" (Green, ii. 71), we have a recognition of the advantages resulting from exchange, and individual interests, it is argued, are not necessarily inconsistent with those of the state, but are, on the contrary, a source of solid good to the whole community.

Municipal laws for the suppression of the mendicancy of the able-bodied and the organization of relief on behalf of the infirm were common in England and on the Continent (Colmar, 1362; Nuremberg, 1478; Strasburg, 1523; London, 1514). Vives (*Ehrle, Beiträge zur Geschichte und Reform der Armenpflege*, p. 26), a Spaniard, who had been at the court of Henry VIII., in a book translated into several languages and widely read, seems to have summed up the thought of the time in regard to the management of the poor. He divided them into three classes: those in hospitals and poor-houses, the public homeless beggars, and the poor at home. He would have a census taken of the number of each class in the town, and information obtained as to the causes of their distress. Then he would establish a central organization of relief under the magistrates. Work was to be supplied for all, while begging was strictly forbidden. Non-settled poor who were able-bodied were to be sent to their homes. Able-bodied settled poor who knew no craft were to be put on some public work—the underserving being set to hard labour. For others work was to be found, or they were to be assisted to become self-supporting. The hospitals provided with medical advice and necessities were to be classified to meet the needs of the sick, the blind, and lunatics. The poor living at home were to work with a view to their self-support. What they earned, if insufficient, might be supplemented. If a citizen found a case of distress he was not to help it, but to send it for inquiry to the magistrata. Children were to be taught. Private relief was to be obtained from the rich. The funds of endowed charities were to be the chief source of income; if more was wanted, bequests and church collections would suffice. The scheme was put in force in Ypres in 1524. The Sorbonne approved it, and similar plans were adopted in Paris and elsewhere. It is in outline the scheme of London municipal charity promoted by Edward VI., by which the poor were classified, St Bartholomew's and St Thomas's hospitals appropriated for the sick, Christ's hospital for the children

The organization of municipal relief.

of the poor, and Bridewell for the correction of the able-bodied. Less the institutional arrangements and plus the compulsory rate, the methods are those of the Poor Relief Act of Queen Elizabeth of 1601. At first the attempt had been made to introduce state relief in reliance on voluntary alms (1 Mary 13, 5 Eliz. 3, 1562-63), subject to the right of assessment if alms were refused. But the position was anomalous. Charity is voluntary, and spontaneously meets the demands of distress. Such demands have always a tendency to increase with the supply. Hence the very limitations of charitable finance are in the nature of a safeguard. At most economic trouble can only be assuaged by relief, and it can only be met or prevented by economic and social reforms. If a compulsory rate be not enforced, as in Scotland and formerly in some parishes in England, a voluntary rate may be made in supplementation of the local charities. In Scotland, where the compulsory clauses of the Poor Relief Act of James I. were not put in force, the country weathered the storm without them, and the compulsory rate, which was extended throughout the country by the Poor Act of 1844, came in very slowly in the 18th and 19th centuries. In France (1566) a similar Act was passed and set aside. If a compulsory rate be enforced, it is inevitable that the resources of charity, unless kept apart from the poor-law and administered on different lines from it, will diminish, and at the same time, as has happened often in the case of endowed charities, the interest in charitable administration will lapse, while the charges for poor-law relief, drawn without much scruple from the taxation of the community, will mount to millions either to meet increasing demands or to provide more elaborate institutional accommodation. The principle once adopted, it was enacted (1572-73), that the aged and infirm should be cared for by the overseers of the poor, a new authority; and in 1601 the duplicate Acts were passed, that for the relief of the poor (43 Eliz. 2), and that for the furtherance and protection of endowed charities. Thus the poor were brought into the dependence of a legally recognized class, endowed with a claim for relief, on the fulfilment of which, after a time, they could without difficulty insist if they were so minded. The civic authority had indeed taken over the alms of the parish, and an *elemosyna civica* had taken the place of the *annona civica*. It was a similar system under a different name.

A phrase of Cecil's indicates the minute domestic character of the Elizabethan legislation (D'Ewes, 674).

Poor Relief Acts and statutory serfdom. The question (1601) was the repeal of a statute of tillage. Cecil says: "If in Edward I.'s time a law was made for the maintenance of the fry and fish, and in Henry VII.'s for the preservation of the eggs of wild fowl, shall we now throw away a law of more consequence and import? If we debar tillage, we give scope to the depopulating. And then, if the poor being thrust out of their houses go to dwell with others, straight we catch them with the statute of inmates; if they wander abroad, they are within the danger of the statute of the poor to be whipt. So by this undo this statute, and you endanger many thousands." A strong central Government and a network of legislation controlled the whole movement of economic life. On this reliance was placed to meet economic difficulties. Since 23 Edw. III. there had been labour statutes; and in 1562 a new statute was passed—not repealed till 1775—empowering the magistrates in quarter sessions to fix the rate of wages for husbandmen and artificers, and enforce it by fine and imprisonment (Rogers, v. 611); requiring yearly service in many employments; compelling persons between 15 and 60, not otherwise employed or apprenticed, to serve in husbandry; preventing migration from city or parish without a testimonial, and compelling single women to work by the year, week, or day; controlling apprenticeship, and ordaining that persons refusing to be apprenticed should be imprisoned. By this, in conjunction with other measures, the labouring classes were finally committed to a new bondage, when they had freed themselves from the serfdom of feudalism, and when the control exercised over them by the guild and municipality was relaxed. The statute was so enforced that to earn a year's livelihood would have taken a labourer not 52 weeks, but sometimes two years, or 58 weeks, or 80 weeks, or 72 weeks; sometimes, however, less—48 or 35. The rate fixed during the Commonwealth remained practically

unchanged till the last quarter of the 18th century. It followed that on such a system the country could only with the utmost good fortune free itself from the economic difficulties of the century, and that the need of a poor-law was felt the more as these difficulties persisted. A voluntary or a municipal system could not suffice, even as a palliative, while such statutes as these were in force to render labour immobile and unprogressive. Also, while wages were fixed by statute or order, whether chiefly in the interest of the employers or not, obviously any shortage on the wages had to be made good by the community. The community, by fixing the wages to be earned in a livelihood, made itself responsible for their sufficiency. And accordingly we find that in the year in which the Statute of Labourers (1562) was passed, that for the enforcement of assessments of poor-rate was also enacted. The Law of Settlement passed in the reign of Charles II. was due, it is said, to a migration of labourers southward from counties where less favourable statutory wages prevailed; but it was, in fact, only a corollary of the Statute of Labourers and the Poor Relief Acts of 1562 and 1601. These laws, it may be said, were the means of making the English labourer, until the poor-law reform of 1834, a settled but landless serf, supported by a fixed wage and a state bounty. By the poor-law it was possible to continue this state of things till, in consequence of an absolute economic breakdown, there was no alternative but reform.

The philanthropic nature of the poor-law is indicated by its antecedents: once enacted, its bounties became a right; its philanthropy disappeared in a quasi-legal claim. Its object was to relieve the poor by home industries, apprentice children, and provide necessary relief to the poor unable to work. The Act was commonly interpreted so as to include the whole of that indefinite class, the "poor"; by a better and more rigid interpretation it was, at least in the 19th century, held to apply only to the "destitute." The economic fallacy of home industries founded on rate-supplied capital early declared itself, and the method could only have continued as long as it did because it formed part of a general system of industrial suppression. When in the 18th century workhouses were established, the same industrial fallacy, as records show, repeated itself under new conditions. Within the parish it resulted in the farmer paying the labourer as small a wage as possible, and leaving the parish to provide whatever he might require in addition during his working life and in his old age. Thus, indeed, a gigantic experiment in civic employment was made for centuries on a vast scale throughout the country—and failed. As was natural, the lack of economic independence reacted on the morals of the people. With pauperism came want of energy, idleness, and a disregard for chastity and the obligations of marriage. The law, it is true, recognized the mutual obligations of parents and grandparents, children and grandchildren; but in the general poverty which it was itself a means of perpetuating such obligations became practically obsolete, while at all times they were difficult to enforce. Still, the fact that they were recognized implies a great advance in charitable thought. The Act, passed at first from year to year, was very slowly put in force. Even before it was passed the poor-rate assessed under the Act of 1562 was felt to be "a greater tax than some subsidies," and in the time of Charles II. it amounted to a third of the revenue of England and Wales (Rogers, v. 81).

The service of villan and cottar was, as we have now seen, in part superseded by what we have called a statutory serfdom founded on a basis of wage supplemented by relief; to such a system a poor-law was a necessary

adjunct. But it follows that with the decay of this serfdom the poor-law itself should have disappeared, or should take some new and very limited form. Unfortunately, as in Roman times, state relief proved to be a popular and vigorous parasite that outlived the tree on which it was rooted: the labour statutes were repealed in 1775, and a century later the Act against illegal combinations of working men; but the serfdom of the poor-law, the *elemosyna civica*, remained, to work for half a century the gravest evil to the labouring classes, and after that period to impede and hamper greatly the recovery of their independence. Nevertheless, by a new law of state alms for the aged, or by increased outdoor relief, it is now proposed to bring them once again under a thralldom similar to that from which they have so slowly emancipated themselves.

The policy adopted by Queen Elizabeth for the relief of the poor (1601) included a scheme for the reorganization of voluntary charity as well as plans for the extension of rate-aided relief. During the century, as we have seen, endeavours had been made to create a system of voluntary charity.

This it was proposed to safeguard and promote concurrently with the extension of the poor-rate. Accordingly, in the poor-law it was arranged that the overseers, the new civic authority, and the churchwardens, the old parochial and charitable authority, should act in conjunction, and, subject to magisterial approval, together "raise weekly or otherwise" the necessary means "by taxation of every inhabitant." The old charitable organization was based on endowment, and the churchwarden was responsible for the administration of many such endowments. What was not available from these and other sources was to be raised "by taxation." The object of the new Act was to encourage charitable gifts.

Towards the end of the 18th century, when the administration of poor relief fell into confusion, many charities were lost, or were in danger of being lost, and many were mismanaged. In 1786 and 1788 a committee of the House of Commons reported on the subject. In 1818, chiefly through the instrumentality of Lord Brougham, a commission of inquiry on educational charities was appointed, and in 1819 another commission to investigate (with some exceptions) all the charities for the poor in England and Wales. These and subsequent commissions continued their inquiries till 1835, when a select committee of the House of Commons made a strong report, advocating the establishment of a permanent and independent board, to inquire, to compel the production of accounts, to secure the safe custody of charity property, to adapt it to new uses on *cy-près* lines, &c. A commission followed in 1849, and eventually in 1853 the first Charitable Trusts Act was passed, under which "The Charity Commissioners of England and Wales" were appointed.

The following are details of importance:—(1) *Definition*.—The definition of the Act of 1601 (Charitable Uses, 43 Eliz. 4) still holds good. It enumerates as charitable objects all that was once called "alms": (a) "The relief of aged, impotent, and poor people"—the normal poor; "the maintenance of sick and maimed soldiers and mariners"—the poor chiefly by reason of war, sometime a class of privileged mendicants; (b) education, "schools of learning, free schools, and scholars in universities"; and then (c) a group of objects which include general civic and religious purposes, and the charities of guilds and corporations; "the repair of bridges, ports, havens, causeways, churches, sea-banks, and highways; the education and preferment of orphans; the relief, stock, or maintenance for houses of correction; marriages of poor maids, supportation, aid, and help of young tradesmen, handicraftsmen, and persons decayed"; and there follows (d) "the relief or redemption of prisoners or captives"; and, lastly, (e) "the aid and ease of any poor inhabitants concerning payment of fifteens" (the property-tax of Tudor times),

setting out of soldiers, and other taxes. The definition might be illustrated by the charitable bequests of the next 60, or indeed 225, years. It is a fair summary of them. (2) *Charitable Gifts*.—A public trust and a charitable trust are, as this definition shows, synonymous. It is a trust which relates to public charities, and is not held for the benefit of private persons, *e.g.*, relations, but for the common good, and, subject to the instructions of the founder, by trustees responsible to the community. Gifts for charitable purposes, other than those affected by the law of mortmain, have always been viewed with favour. "Where a charitable bequest is capable of two constructions, one of which would make it void and the other would make it effectual, the latter will be adopted by the court" (Tudor's *Charitable Trusts*, ed. 1889, by L. S. Bristowe and W. I. Cook, p. 28). Gifts to the poor, or widows, or orphans, indefinitely, or in a particular parish, were valid under the Act, or for any purpose or institution for the aid of the "poor." Thus practically the Act covered the same field as the poor-law, though afterwards it was decided that, "as a rule, persons receiving parochial relief were not entitled to the benefit of a charity intended for the poor" (Tudor, p. 104). (3) *Religious Differences*.—In the administration of charities which are for the poor the broadest view is taken of religious differences. (4) *Superstitious Uses*.—The superstitious use is one that has for its object the propagation of the rites of a religion not tolerated by the law (Tudor, p. 18). Consequently, so far as charities were held or left subject to such rites, they were illegal, or became legal only as toleration was extended. Thus by degrees, since the Toleration Act of 1688, all charities to dissenters have become legal—that is, trusts for schools, places for religious instruction, education, and charitable purposes generally. But bequests for masses for the soul of the donor, or for monastic orders, are still void. (5) *Administration*.—The duty of administering charitable trusts falls upon trustees or corporations, and under the term "eleemosynary corporations" are included endowed hospitals and colleges. Under schemes of the Charity Commissioners, where charities have been remodelled, besides trustees elected by corporations, there are now usually appointed *ex officio* trustees who represent some office or institution of importance in connexion with the charity. (6) *Jurisdiction by Chancery and Charity Commission*.—The Court of Chancery has jurisdiction over charities, under the old principle that "charities are trusts of a public nature, in regard to which no one is entitled by an immediate and peculiar interest to prefer a complaint for compelling the performance by the trustees of their obligations." The court, accordingly, represents the Crown as *parens patrie*. Now, by the Charitable Trusts Act, 1853, and subsequent Acts, a charity commission has been formed which is entrusted with large powers, formerly enforced only by the Court of Chancery. (7) *Jurisdiction by Visitor*.—A further jurisdiction is by the "visitor," a right inherent in the founder of any eleemosynary corporation, and his heirs, or those whom he appoints, or in their default, the king. The object of the visitor is "to prevent all perverting of the charity, or to compose differences among members of the corporation." Formerly the bishop's ordinary was the recognized visitor (2 Henry V. i. 1) of hospitals, apart from the founder. Subsequently his power was limited (14 Eliz. c. 5) to hospitals for which the founders had appointed no visitors. Then (1601) by the Charitable Uses Act commissions were issued for inquiry by county juries. Now, apart from the duty of visitors, inquiry is conducted by the charity commissioners and the assistant commissioners. By subsequent Acts (see below) ecclesiastical and eleemosynary charities have been still further separated and defined. (8) *Advice*.—Trustees, or other persons concerned in the management of a charity, may apply to the charity commissioners for their opinion, advice, or direction; and any person acting under such advice is indemnified, unless he has been guilty of misrepresentation in obtaining it. (9) *Limitation of Charity Commissioners' Powers*.—The commissioners cannot, however, make any order with respect to any charity of which the gross annual income amounts to £50 or upwards, except on the application of the trustees or a majority of them. Their powers are thus very limited, except when put in motion by the trustees. If a parish is divided they can apportion the charities if the gross income does not exceed £20. (10) *General Powers of the Charity Commission*.—Subject to the limitation of £50, &c., the charity commissioners have power (Charitable Trusts Act, 1860) to make orders for the appointment or removal of trustees, or of any officer, and for the transfer, payment, and vesting of any real or personal estate, or "for the establishment of any scheme for the administration" of the charity. (11) *Schemes and Remodelling of Charities*.—Under this power charities are remodelled, and small and miscellaneous charities put into one fund and applied to new purposes. The *cy-près* doctrine is applied, by which if a testator leaves directions that are only indefinite, or if the objects for which a charity was founded are obsolete, the charity is applied to some purpose, as far as possible, in accordance with the charitable intention of the founder. This

doctrine probably received its widest application in the City of London Parochial Charities Act of 1883. Under other Acts doles have been applied to education and to allotments. About 380 schemes are issued in the course of a year. (12) *Objects adopted in remodelling Charities.*—In the remodelling of charities for the general benefit of the poor some one or more of thirteen objects are usually included in the scheme. These are subscriptions to a medical charity, to a provident club or coal or clothing society, to a friendly society; for nurses, for annuities, for outfit for service, &c.; for emigration; for recreation grounds, clubs, reading-rooms, museums, lectures; for temporary relief to a limited amount in each year; for clothes, fuel, tools, medical aid, food, &c., or in money "in cases of unexpected loss or sudden destitution"; for pensions. (13) *Parochial Charities.*—By the Local Government Act of 1892, local ecclesiastical charities, *i.e.*, endowments for "any spiritual purpose that is a legal purpose" (for spiritual persons, church and other buildings, for spiritual uses, &c.) are separated from parochial charities, "the benefits of which are, or the separate distribution of the benefits of which is, confined to inhabitants of a single parish, or of a single ancient ecclesiastical parish, or not more than five neighbouring parishes." These charities are now brought under the supervision of the recently established parish councils, who appoint trustees for their management in lieu of the former overseer or vestry trustees, or,

under certain conditions, "additional trustees." The accounts have to be submitted to the parish meeting, and the names of the beneficiaries of dole charities published. (14) *Official Trustees.*—There is also "an official trustee of charity lands," who as "bare trustee" may hold the land or stock of the charity managed by the trustees or administrators. At present the stock transferred to the official trustees amounts to £20,178,654. (15) *Audit.*—The charity commissioners have no power of audit, but the trustees of every charity have to prepare a statement of accounts annually, and transmit it to the commission. The accounts have to be "certified under the hand of one or more of the trustees and by the auditor of the charity." (16) *Taxation.*—In the case of rents and profits of lands, &c., belonging to hospitals or almshouses, or vested in trustees for charitable purposes, allowances are made in diminution of income-tax (56 Vict. 35, § 61). From the inhabited house duty any hospital charity school, or house provided for the reception or relief of poor persons, is exempted (48 Geo. III. c. 55). Also there is an exemption from the land-tax in regard to land rents, &c., in possession of hospitals before 1693. (17) *The Digest.*—A digest of endowed charities in England and Wales was compiled in the years 1861 to 1876. A new digest of reports and financial particulars is now in progress. The following table gives the income of endowed charities at that time and its chief uses:—

According to Inquiry, 1861-76.	Income from		Total.	Total former Income. 1819-37.	Apprenticing and Advancement.	Almshouses and Pensioners.	Distribution in Kind.	Distribution in Money.	General Uses of Poor.	Medical Charities.
	Real Estate.	Personal Estate.								
Counties, including Cities of London and Westminster	£ 1,148,955	£ 394,726	£ 1,543,681	£ 966,573	£ 61,476	£ 408,426	£ 123,298	£ 143,587	£ 34,707	£ 19,085
Diocesan charities	1,315	9,486	10,801	...	77	2,248	...	7,747		
Society of Friends' charities	17,185	10,240	27,425	...	1,978	1,100	9	8,990	2,279	
General charities	390,795	225,761	616,556	232,654	24,334	140,346	804	16,566	27,332	180,055
	1,558,250	640,213	2,198,463	1,199,227	87,865	552,120	124,111	176,890	64,818	199,140

The income of endowed charities is now, no doubt, considerably larger than it was in 1876. Partial returns show that at least a million a year is now available in England and Wales for the assistance of the aged poor and for doles. Between the poor-law, which, as it is at present administered, is a permanent endowment provided from the rates for the support of a class of permanent "poor," and endowed charities, which are funds available for the poor of successive generations, there is no great difference. But in their resources and administration the difference is marked. Local endowed charities were constantly founded after Queen Elizabeth's time till about 1830, and the poor-rate was at first supplementary of the local charities. When corn and fuel were dear and clothes very expensive, what now seem trivial endowments for food, fuel, coal, and clothes were important assets in the thrifty management of a parish. But when the poor were recognized as a class of dependants entitled by law to relief from the community, the rate increased out of all proportion to the charities. A distinction then made itself felt between the "parish" poor and the "second" poor, or the poor who were not relieved from the rates, and relief from the rates altogether overshadowed the charitable aid. Charitable endowments were ignored, ill-administered, and often were lost. After 1834 the poor-law was brought under the control of the central Government. Poor relief was placed in the hands of boards of guardians in unions of parishes. The method of co-operation between poor-law and charity suggested by the Acts of Queen Elizabeth was set aside, and, as a responsible partner in the public work of charity relief, was disestablished. In the parishes the endowed charities remained in general a disorganized medley of separate trusts, jealously guarded by incompetent administrators. To give unity to this mass of units, so long as the principles of charity are misunderstood or ignored, has proved an almost impossible and certainly an unpopular task. So far as it has been achieved, it has been accomplished by the piecemeal legislation of schemes cautiously elaborated to meet local prejudices. Active reform has been resented, and politicians have often accentuated this resentment. Recently several inquiries have been made by Parliamentary committees into the action of the charity commissioners, but no serious grievances were substantiated. The committees' reports are of interest, however, as an indication of the initial difficulties of all charitable work, the general ignorance that prevails in regard to the elementary conditions that govern it, the common disregard of these principles, and the absence of any accepted theory or constructive policy that should regulate its development and its administration.

After the Poor-Law Act of 1601 the history of the voluntary

parochial charities in a town parish is marked by their decreasing amount and utility, as poor-law relief and pauperism increase. The Act, it would seem, was not adopted with much alacrity by the local authorities. From 1625 to 1646 there were many years of plague and sickness, but in St Giles's, London, as late as 1649, the amount raised by the "collectors" (or overseers) was only £176. They disbursed this to "the visited poor" as "pensions." In 1665 an extra levy of £600 is mentioned. In the accounts of St Martin's-in-the-Fields, where, as in St Giles's, gifts were received, the change wrought by another half-century (1714) is apparent. The sources of charitable relief are similar to those in all the Protestant churches—English, Scottish, or Continental: church collections and offerings; correctional fines, such as composition for bastards and conviction money for swearers; and besides these, income from annuities and legacies, the parish estate, the royal bounty, and "petitions to persons of quality." In all £2041 was collected, but, so far as relief was concerned the parish relied not on it, but on the poor-rate, which produced £3765. All this was collected and disbursed on their own authority by collectors, to orphans, "pensioners" or the "known or standing" poor, or to casual poor (£1818), including nurse children and bastards. The begging poor were numerous and the infant death-rate enormous, and each year three-fourths of those christened were "inhumanly suffered to die by the barbarity of nurses." The whole administration was uncharitable, injurious to the community and the family, and inhuman to the child. If one may judge from later accounts of other parishes even up to 1834, usually it remained the same, purposeless and unintelligent; and it can hardly be denied that, generally speaking, only in the last fifty years has any serious attention been paid to the charitable side of parochial work. Parallel to the parochial movement of the poor-law in England, in France (about 1617) were established the *bureaux de bienfaisance*, at first entirely voluntary institutions, then recognized by the state, and during the Revolution made the central administration for relief in the communes.

In the 17th century in England, as in France, opinion favoured the establishment of large hospitals or *maisons Dieu* for the reception of the poor of different *Charitable* classes. In France throughout the century there *movements* was a continuous struggle with mendicancy, *after 1601.* and the hospitals were used as places into which offenders were summarily driven. A new humanity was, however, beginning its protest. The pitiful condition of abandoned

children attracted sympathy in both countries. St Vincent de Paul established homes for the *enfants trouvés*, followed in England by the establishment of the Foundling Hospital (1739). In both countries the method was applied inconsiderately and pushed to excess, and it affected family life most injuriously. Grants from Parliament supported the foundling movement in England, and homes were opened in many parts of the country. The demand soon became overwhelming; the mortality was enormous, and the cost so large that it outstripped all financial expedients. The lesson of the experiment is the same as that of the poor-law catastrophe before 1834; only, instead of the able-bodied poor of another age, infants were made the object of a compassionate but undiscerning philanthropy. With widespread relief there came widespread abandonment of duty and economic bankruptcy. Had the poor-rates instead of charitable relief been used in the same way, the moral injury would have been as great, but the annual draft from the rates would have concealed the moral and postponed the economic disaster. To amend the evil changes were made by which the relation between child and mother was kept alive, and a personal application on her part was required; the character of the mother and her circumstances were investigated, and assistance was only given when it would be "the means of replacing the mother in the course of virtue and the way of an honest livelihood." General reforms were also made, especially through the instrumentality of Jonas Hanway, to check infant mortality, and metropolitan parishes were required to provide for their children outside London. A kindred movement led to the establishment of penitentiaries (1758), of lock hospitals and lying-in hospitals (1749-1752).

In Queen Anne's reign there was a new educational movement—"the charity school"—"to teach poor children the alphabet and the principles of religion," followed by the Sunday-school movement (1780), and about the same time (1788) by "the school of industry"—to employ children and teach them to be industrious. In 1844 the Ragged School Union was established, and until the Education Act of 1870 continued its voluntary educational work. As an outcome of these movements, through the efforts of Miss Mary Carpenter and many others, in 1854-55 industrial and reformatory schools were established, to prevent crime and reform child criminals. The orphanage movement, beginning in 1758, when the Orphan Working Home was established, has been continued to the present day on a vastly extended scale. In 1772 a society for the discharge of persons imprisoned for small debts was established, and in 1773 Howard began his prison reforms. This raised the standard of work in institutional charities generally. After the civil wars the old hospital foundations of St Bartholomew and St Thomas, municipalized by Edward VI., became endowed charities partly supported by voluntary contributions. The same fate befell Christ's Hospital, in connexion with which the voting system, the admission of candidates by the vote of the whole body of subscribers—that peculiarly English invention—first makes its appearance. A new interest in hospitals sprang up at the end of the 17th century. St. Thomas's was rebuilt (1693) and St. Bartholomew's (1739); Guy's was founded in 1724, and on the system of free "letters" obtainable in exchange for donations, voluntary hospitals and infirmaries were established in London (1733 and later) and in most of the large towns. Towards the end of the century the dispensary movement was developed,—a system of local dispensaries with fairly definite districts and home visiting, a substitute for attendance at a hospital, where "hos-

pital fever" was dreaded, and an alternative to what was then a very ill-administered system of poor-law medical relief. After 1840 the provident dispensary was introduced, in order that the patients by small contributions in the time of health might provide for illness without having to meet large doctors' bills, and the doctor might receive some sufficient remuneration for his attendance on poor patients. This movement was largely extended after 1860. Three Hospital Funds for collecting contributions for hospitals and making them grants, a movement that originated in Birmingham in 1859, were established in London in 1873 and 1897. Since 1868 the poor-law medical system of Great Britain has been immensely improved and extended, while at the same time the number of persons in receipt of free medical relief in most of the large towns has greatly increased. The following figures refer to London: in-patients at hospitals (1900) during the year, 103,765; out-patients and casualty cases, 1,584,987; patients at free, part-pay, or provident dispensaries, about 280,000; in poor-law infirmaries (1897), 36,294; orders issued for attendance at poor-law dispensaries and at home, 109,653. There are in London 12 general hospitals with, 13 without, medical schools, and 86 special hospitals. Thus the population in receipt of public and voluntary medical relief is very large, indeed altogether excessive.

Each religious movement has brought with it its several charities. The Society of Friends, the Wesleyans, the Baptists have large charities. With the extension of the High Church movement there have been established many sisterhoods which support penitentiaries, convalescent homes and hospitals, schools, missions, &c.

The magnitude of this accumulating provision of charitable relief is evident, though it cannot be summed up in any single total.

At the beginning of the 19th century anti-mendicity societies were established; and later, about 1869, in England and Scotland a movement began for the organization of charitable relief, in connexion with which there are now societies and committees in most of the larger towns in Great Britain, in the Colonies, and in the United States of America. More recently the movement for the establishment of settlements in poor districts, initiated by Canon Barnett at Toynbee Hall—"to educate citizens in the knowledge of one another, and to provide them with teaching and recreation"—has spread to many towns in England and America.

These notes of charitable movements suggest an altogether new development of thought. On behalf of the charity school of Queen Anne's time were preached very formal sermons, which showed but little sympathy with child life. After the first half of the century a new humanism, with which we connect the name of Rousseau, slowly superseded this formal beneficence. Rousseau made the world open its eyes and see nature in the child, the family, and the community. He analysed social life, intent on explaining it and discovering on what its well-being depended; and he stimulated that desire to meet definite social needs which is apparent in the charities of the century. Little as it may appear to be so at first sight, it was a period of charitable reformation. Law revised the religious conception of charity, though he was himself so strangely devoid of social instinct that, like some of his successors, he linked the utmost earnestness in belief to that form of almsgiving which most effectually fosters beggary. Howard introduced the era of inspection, the ardent apostle of a new social sagacity; and Bentham, no less sagacious, propounded opinions, plans, and suggestions which, perhaps it may be said, in due course moulded the prin-

Progress of thought in 18th and 19th centuries.

ciples and methods of the poor-law of 1834. In the broader sense the turn of thought is religious, for while usually stress is laid on the religious scepticism of the century, the deeper, fervent, conscientious, and evangelical charity in which Nonconformists, and especially "the Friends," took so large a part, is often forgotten. Sometimes, indeed, as often happens now, the feeling of charity passed into the merest sentimentality. This is evident, for instance, from so ill-considered a measure as Pitt's Bill for the relief of the poor. On the other hand, during the 18th century the poor-law was the object of constant criticism, though so long as the labour statutes and the old law of settlement were in force, and the relief of the labouring population as state "poor" prevailed, it was impossible to reform it. Indeed, the criticism itself was generally vitiated by a tacit acceptance of "the poor" as a class, a permanent and irrevocable charge on the funds of the community; and at the end of the 18th century, when the labour statutes were abrogated, but the conditions under which poor relief was administered remained the same, serfdom in its later stage, the serfdom of the poor-law, asserted itself in its extremest form in times of dearth and difficulty during the Napoleonic war. In 1802-03 it was calculated (Marshall's *Digest*) that 28 per cent. of the population were in receipt of permanent or occasional relief. Those in receipt of the former numbered 734,817, including children—so real had this serfdom of the poor become. In 1832 the expenditure on pauperism in England and Wales was £7,036,968. In the early years of the 19th century the mendicity societies, established in some of the larger towns, were a sign of the general discontent with existing methods of administration. The Society for Bettering the Condition of the Poor—representing a group of men such as Colquhoun, Bernard, Lettson, Haygarth, Neald, and others—took a more positive line and issued many useful publications (1796). After 1833 the very atmosphere of thought seems changed. There was a general desire to be quit of the serfdom of pauperism. The Poor-Law Amendment Act was passed in 1834, and since then male able-bodied pauperism has dwindled to a minimum. The bad years of 1860-70 revived the problem in England and Scotland, and the old spirit of reform for a time prevailed. Improved administration working with economic progress effected still further reductions of pauperism, till in 1900 it stood at 688,505, or 21·7 per thousand of the population, instead of at 45 per thousand as in 1851. (See article POOR-LAW.) Charity organization societies were formed after 1869, with the object of "improving the condition of the poor," or, in other words, to promote independence by an ordered and co-operative charity; and the Association for Befriending Young Servants, and workhouse aid committees, in order to prevent relapse into pauperism on the part of those who as children or young women received relief from the poor-law. The Local Government Board adopted a restricted out-door relief policy, and a new interest was felt in all the chief problems of local administration. The movement was general. The results of the Elberfield system of municipal relief administered by unpaid almoners, each dealing with but one or two cases, influenced thought both in England and America. The experience gained by Mr Joseph Puckerman of New York of the utility of registering applications for relief, and the teaching of Miss Octavia Hill, led to the foundation of the system of friendly visiting and associated charity at Boston (1880) and elsewhere. Since that time the influence of Arnold Toynbee and the investigations of Mr Charles Booth have led to a better appreciation of the conditions of labour; and to some extent, in London and elsewhere, the spirit of charity has assumed the form of a new

devotion to the duties of citizenship. But perhaps, in regard to charity in Great Britain, the most important change has been the revival of the teaching of Dr Chalmers (1780-1847), who (1819) introduced a system of parochial charity at St John's, Glasgow, on independent lines, consistent with the best traditions of the Scottish Church. In the development of the theory of charitable relief on the economic side this has been a main factor. His view, which he tested by experience, may be summed up as follows. Society is a growing, self-supporting organism. It has within it, as between family and family, neighbour and neighbour, master and employee, endless links of sympathy and self-support. Poverty is not an absolute, but a relative term. Naturally the members of one class help one another; the poor help the poor. There is thus a large invisible fund available and constantly used by those who, by their proximity to one another, know best how to help. The philanthropist is an alien to this life around him. Moved by a sense of contrast between his own lot, as he understands it, and the lot of those about him, whom he but little understands, he concludes that he should relieve them. But his gift, unless it be given in such a way as to promote this self-support, instead of weakening it, is really injurious. In the first place, by his interference he puts a check on the charitable resources of another class and lessens their social energy. What he gives they do not give, though they might do so. But next, he does more harm than this. He stimulates expectation, so that by a false arithmetic his gift of a few shillings seems to those who receive it and to those who hear of it a possible source of help in any difficulty. To them it represents a large command of means; and where one has received what, though it be little, is yet, relative to wage, a large sum to be acquired without labour, many will seek more, and with that object will waste their time and be put off their work, or even be tempted to lie and cheat. So social energy is diverted from its proper use. Alms thus given weakens social ties, diminishes the natural relief funds of mutual help, and beggars a neighbour instead of benefiting him. By this argument a clear and well-defined purpose is placed before charity. Charity becomes a science based on social principles and observation. Not to give alms, but to keep alive the saving health of the family, becomes its problem: relief becomes altogether subordinate to this, and institutions or societies are serviceable or the reverse according as they serve or fail to serve this purpose. Not poverty, but distress is the plea for help; not almsgiving, but charity the means. To charity is given a definite social aim, and a desire to use consistently with this aim every method that increasing knowledge and trained ability can devise. Under such influences as these, joined with better economic conditions, a great reform has been made. The poor-law, however, remains—our modern *eleemosyna civica*. It now, indeed, absorbs a proportionately lesser amount of the largely increased national income, but, excluding the maintenance of lunatics, it costs Great Britain nearly ten millions a year; and among the lower classes of the poor, directly or indirectly, it serves as a bounty on dependence and is a permanent obstacle to thrift and self-reliance. The number of those who are within the circle of its more immediate attraction is now perhaps, in different parts of the country, not more than 20, 25, or 30 per cent. of the population. Upon that population the statistics of a day census would show a pauperism not of 2·50 but of 12·50 to 8·33 per cent.; and the percentage would be much greater—twice as large perhaps—if the total number of those who in some way received poor relief in the course of a year were taken into account. The poor-law is thus among the

lower classes, those most tempted to dependence—say some six or seven millions of the people—a very potent influence definitely antagonistic to the good development of family life, unless it be limited to very narrow proportions; as, for instance, to restricted indoor or institutional relief for the sick, for the aged and infirm, who in extreme old age require special care and nursing, and for the afflicted, for whom no sufficient charitable provision is procurable. As ample experience shows, only on these conditions can poor-law relief be justified from the point of view of charity and the common good. In marked contrast to this opinion is the agitation for pensions. These, it was at first proposed, should be given out of the national exchequer to all persons over 65, at the rate of five shillings a week; and, were the plan adopted in spite of its great cost, a system of state alms for the aged would be set on foot, unlike the *annona civica*, since it would be available not for citizens only, a comparatively small part of the population, but for the whole population, yet like the *annona*, since it would be claimed as a right—a huge charity endowed with unlimited funds, funds which ultimately may largely exceed the normal cost of the army or the navy. Schemes of the kind are being adopted in some colonies—in New Zealand, for instance, and Victoria—with some apparent safeguards. In England, failing any such plan, the Local Government Board in 1900 urged the boards of guardians to give large outdoor relief to aged deserving people, and laid no stress on the test of destitution, the neglect of which led to many of the difficulties of the old poor-law. History has proved that demoralization results from the wholesale relief whether of the mass of the citizens, or of the able-bodied, or of the children, and the fact that it is now proposed to limit the endowment to the aged makes no substantial difference. The social results must be similar; but social forces work slowly, and usually only the unanswerable argument of financial bankruptcy suffices to convert a people habituated to dependence, though the inward decay of vitality and character may long before be manifest. Ultimately the distribution of pensions by way of out-door relief, corrupting a far more independent people, would work a far greater injury than the *annona civica*. Such an endowment of old age might indeed be justified as part of a system of regulated labour, which, as in earlier times, could not be enforced without some such extraneous help, but it could not be justified otherwise. It is naturally associated, therefore, with socialistic proposals for the regulation of wage.

In the light of the principles of charity, which we have considered historically, we have now to turn to two questions: charity and economics, and charity and socialism.

The object of charity is to render to our neighbour the services and duties of goodwill, friendship, and love. To

prevent distress charity has for its further object to preserve and develop the manhood and womanhood of individuals and their self-maintenance in and through the family; and any form of state intervention is approved or disapproved by the same standard. By self-maintenance is meant self-support throughout life in its ordinary contingencies—sickness, widowhood, old age, &c. Political economy we would define as the science of exchanges. Here it has to be considered in relation to the purposes of charity. By way of illustration we take, accordingly, three points: distribution and use, supplementation of wage, and the standard of well-being in relation to wage.

(1) *Distribution and Use*.—Economy in the Greek sense begins at this point—the use of means and resources. Political economy ignores it. Yet from the point of view of charity it is cardinal to the whole issue. The distribution of wage may or may not be

largely influenced by trades unions; but the variation of wage, as is generally the case, by the increase or decrease of a few pence is of less importance than its use. Comparing a careful and an unthrifty family, the difference in use may amount to as much as a third on the total wage. Mere abstinence from alcohol may make, in a normal family, a difference of 6s. in a wage of 25s. On the other hand, membership of a friendly society is at a time of sickness equivalent to the command of a large sum of money, for the common stock of capital is by that means placed at the disposal of each individual who has a share in it. Further, even a small amount saved may place the holder in a position to get a better market for his labour; he can wait when another man cannot. Rent may be high, but by co-operation that too may be reduced. Other points are obvious and need not be mentioned. It is evident that while the amount of wage is important, still more important is its use. In use it has a large expansive value. (2) *Supplementation of Wage*.—The exchange between skill and wage must be free if it is to be valid. The less the skill the greater is the temptation to philanthropists to supplement the lesser wage; and the more important is non-supplementation, for the skilled can usually look after their own interests in the market, while the less skilled, because their labour is less marketable, have to make the greater effort to avoid dependence. But the dole of endowed charities, outdoor relief, and any constant giving, tend to reduce wage, and thus to deprive the recipients of some part of the means of independence. The employer is pressed by competition himself, and in return he presses for profit through a reduced wage, if circumstances make it possible for the workman to take it. And thus a few individuals may lower the wages of a large class of poorly skilled or unskilled hands. In these conditions unionism, even if it were likely to be advantageous, is not feasible. Unionism can only create a coherent unit of workers where there is a limited market and a definite saleable skill. Except for the time, insufficient wage will not be remedied in the individual case by supplementation in any form—doles, clothes, or other kinds of relief; and in that case, too, the relief will probably produce lessened energy after a short time, or in other words lessened ability to live. An insufficient wage may be prevented by increasing the skill of the worker, who will then have the advantage of a better series of economic exchanges, but hardly otherwise. If the supplementation be not immediate, but postponed, as in the case of old-age pensions, its effect will be similar. To the extent of the prospective adventitious gain the attraction to the friendly society and to mutual help and saving will grow less. Necessity has been the inventor of these; and where wage is small, a little that would otherwise be saved is quickly spent if the necessity for saving it is removed. Only necessity schools most men, especially the weak, to whom it makes most difference ultimately, whether they are thrifty or whether or not they save for the future in any way. (3) *The Standard of Well-being or Comfort in Relation to Wage*.—With an increase of income there has to be an increase in the power to use income intelligently. Whatever is not so used reacts on the family to its undoing. Constantly when the wife can earn a few shillings a week, the husband will every week idle for two or three days. So also if the husband finds that in a few days he can earn enough to meet what he considers to be his requirements for the week. In these circumstances the standard of well-being falls below the standard of wage; the wage is in excess of the energy and intelligence necessary to its economic use, and in these cases ultimately pauperism often ensues. The family is demoralized. Thus, with a view to the prevention of distress in good times, when there is the less poverty there is the more need of charity, rightly understood; for charity would strive to promote the right use of wage, as the best means of preventing distress and preserving the economic well-being of the family.

The theory of charity separates it entirely from socialism, as that word is commonly used. Strictly socialism means, in questions affecting the community, a dominant regard for the common or social good in so far as *Charity and socialism*. it is contrary to private or individual advantage. But even so the antithesis is misleading, for the two need not be inconsistent. On the contrary, the common good is really and ultimately only individual good (not advantage) harmonized to a common end. The issue, indeed, is that of old Greek days, and the conditions of a settlement of it are not substantially different. In fact, however, the word socialism is used to mean the acquisition of class benefits of a personal nature for a particular class, usually called the working or labouring class, at the expense of the rest of the community. In this sense the *annona civica*, the poor-law, and old-age pensions, and many other schemes, are social-

istic. And, as has been shown, since they injure the family and weaken independence, they cannot be charitable. They are naturally associated with regulated or statutory labour, whether in connexion with a statute of wages or the laws of a trades union, for where such measures fail, or seem to fail to provide a sufficient livelihood, relief in some form is called in to supplement the actual or assumed deficiency. Thus charity and socialism, in the usual meaning of the word, imply two quite different theories of social life, and are not in any way compatible.

The springs of charity lie in sympathy and religion. To organize it is to give to it the "ordered nature" of an

The organization of charity.

organic whole, to give it a definite social purpose, and to associate the members of the community for the fulfilment of that purpose. This in turn depends on the recognition of common principles, the adoption of a common method, self-discipline and training, and co-operation. In a mass of people there may be a large variation in motives coincident with much unity in action. Thus there may be acceptance of a common social purpose in charity, while in one the impulse is similar to that which moved St Francis or George Herbert, in another to that which moved Howard or Dr Chalmers, or a modern poor-law reformer like Nicholls or Denison. Accepting, then, the principles of charity, we pass to the method in relation to assistance and relief. Details may vary, but on the following points there is general agreement among students and workers:—

(1) *The Committee or Conference.*—There are usually two kinds of local relief: the public or poor-law relief, and relief connected with religious agencies. Besides, there is the relief of endowments, societies, and charitable persons. Therefore, as a condition precedent to all organization, there must be some local centre of association for information and common help. A town should be divided for this purpose into manageable areas coincident with parishes or poor-law divisions, or other districts. Subject to an acceptance of general principles, those engaged in charity should be members of a local conference or committee, or allied to it. The committee would thus be the rallying-point of a large and somewhat loosely knit association of friends and workers. (2) *Inquiry, Aid, and Registration.*—The object of inquiry is to ascertain the actual causes of distress or dependence, and to carry on the work there must usually be a staff of several honorary and one or two paid workers. Two methods may be adopted: to inquire in regard to applications for help with a view to forming some plan of material help or friendly aid, or both, which will lead to the ultimate self-support of the family and its members, and, under certain conditions, in the case of the aged or sick, to their continuous or their sufficient help; or to ascertain the facts partly at once, partly by degrees, and then to form and carry out some plan of help, or continue to befriend the family in need of help, in the hope of bringing them to conditions of self-support, leaving the work of relief entirely to other agencies. The committee in neither case should be a relief committee—itsself a direct source of relief. On the former method it has usually no relief fund, but it raises from relations, employers, charities, and charitable persons the relief required, according to the plan of help agreed upon, unless, indeed, it is better not to relieve the case, or to leave it to the poor-law. The committee thus makes itself responsible for endeavouring to the best of its ability to raise the necessary relief, and acts as trustee for those who co-operate without it, in such a way as to keep intact and give play to all the natural obligations that lie within the inner circles of a self-supporting community. On the latter method the work of relief is left to general charity, to the private persons, or to the poor-law, to whom the case is notified; and the effort is made to help the family to self-support by a friendly visitor. This procedure is that adopted by the associated charities in Boston, Mass., and other similar societies in America. The method of associated help, combined with personal work, represents the usual practice of charity organization societies. *Mutatis mutandis*, the plan can be adopted on the simplest scale in parochial or other relief committees, subject to the safeguards of sufficient training and settled method. The inquiry should cover the following points: names and address, and ages of family, previous addresses, past employment and wages, present income, rent and liabilities, membership of friendly or other society, and savings, relations, relief (if any) from any source. These points should be verified, and reference should be made to the clergy, the poor-law authorities, and others, to ascertain if they know the applicant. The result

should be to show how the applicant has been living, and what are the sources of possible help, and also what is his character. The problem, however, is not whether the person is "deserving" or "undeserving," but whether, granted the facts, the distress can be stayed and self-support attained. If the help can be given privately from within the circle of the family, so much the better. Often it may be best to advise, but not to interfere. In some cases but little help may be necessary; in others again the friendly relation between applicant and friend may last for months and even years. Usually in charitable work the question of the kind of relief available—money, tickets, clothes, &c.—governs the decision how the case should be assisted. But this is quite wrong: the opposite is the true rule. The wants of the case, rightly understood, should govern the decision as to what charity should do and what it should provide. Cases are overwhelming in number, as at the out-patient and casualty departments of a hospital, where the admissions are made without inquiry, and subject practically to no restrictions; but when there is inquiry, and each case is seriously considered and aided with a view to self-support, the numbers will seldom be overwhelming. On this plan appeal is made to the strength of the applicant, and requires an effort on his part. Indiscriminate relief, on the other hand, attracts the applicant by an appeal to his weakness, and it requires of him no effort. Hence, apart even from the differentiating effect of inquiry, one method makes applicants, the other limits their number, although on the latter plan much more strenuous endeavours be made to assist the lesser number of claimants. For the routine work of the office an extremely simple system of records with card index, &c., has been devised. In some cities, particularly in the United States of America, there is a central registration of cases, notified by individual charities, poor-relief authorities, and private persons. The system of charity organization or associated charity, it will be seen, allows of the utmost variety of treatment, according to the difficulties in each instance and the remedies available, and the utmost scope for personal work. (3) *Training.*—If charitable work is an art, those who undertake it must needs be trained both in practice and method and in judgment. It requires, too, that self-discipline which blends intelligence with emotion, and so endows emotion with strength and purpose. In times of distress a reserve of trained workers is of the utmost service. At all times they do more and produce, socially, better results; but when there is general distress of any kind they do not lose their heads like new recruits, but prevent at least some of the mischief that comes of the panic which often takes possession of a community, when distress is apprehended, and leads to the wildest distributions of relief. Also trained workers make the most useful poor-law guardians, trustees of charities, secretaries of charitable societies, and district visitors. All clergy and ministers and all medical men who have to be engaged in the administration of medical relief should learn the art of charity. Poor-law guardians are usually elected on political or general grounds, and have no special knowledge of good methods of charity; and trustees are seldom appointed on the score of their qualifications on this head. To provide the necessary education in charity there should be competent helpers and teachers at charity organization committees and elsewhere, and an alliance for this purpose should be formed between them and professors and teachers of moral science and economics and "settlements." Those who study social problems in connexion with what a doctor would call "cases" or "practice" see the limits and the falsity of schemes that on paper seem logical enough. This puts a check on the influence of scheme-building and that literary sensationalism which makes capital out of social conditions. (4) *Co-operation.*—Organization in charity depends on extensive co-operation, and ultimately on the acceptance of common views. This comes but slowly. But with much tribulation the goal may be reached, if in case after case the effort is made to provide friendly help through charities and private persons, unless, as may well be, it should seem best not to interfere, but to leave the applicant to apply to the administrators of public relief. Experience of what is right and wrong in charity is thus gained on both sides. Many sources may have to be utilized for aid of different kinds even in a single case, and for the prevention of distress co-operation with members of friendly societies and with co-operative and thrift agencies is indispensable.

Where there is accord between charity and the poor-law pauperism may be largely reduced. The poor-law in most countries has at its disposal certain institutional relief and out-door allowances, but it has no means of devising plans of help which may prevent application to the rates or "take" people "off the rates." Thus a widow in the first days of widowhood applies and receives an allowance according

The poor-law.

to the number of her children. Helped at the outset by charity on some definite plan, she may become self-supporting; and if her family be large one or two of her children may be placed in schools by the guardians, while she maintains the remaining children and herself. As far as possible there should be a division of labour between the poor-law and charity. Except where some plan such as that just mentioned is adopted, one or the other should take whole charge of the case relieved. There should be no supplementation of poor-law relief by charity. This will weaken the strength and dissipate the resources of charity without adding to the efficiency of the poor-law. Unless the guardians adopt a restrictive out-door relief policy, there is no scope for any useful division of labour between them and charity; for the many cases which, taken in time, charity might save from pauperism, they will draw into chronic dependence by their allowances a very much larger number. But if there is a restrictive out-door policy, so far as relief is necessary, charity may undertake to meet on its own lines distress which the poor-law would otherwise have met by allowances, and, subject to the assistance of urgent cases, poor-law relief may thus by degrees become institutional only. Then, in the main, natural social forces would come into play, and dependence on any form of *annona civica* would cease.

Open-handed hospitality always creates mendicants. This is what the hospitals offer in the out-patient and **Hospitals.** casualty departments, and they have created a class of hospital mendicants. The cases are quickly dealt with, without inquiry and without regard to home conditions. The medical man in the hospital does not co-operate with any fellow-workers outside the hospital. Where his physic or advice ceases to operate his usefulness ceases. He regards no conditions of morality. In a large number of cases drink or vice is the cause of application, and the cure of the patient is dependent on moral conditions; but he returns home, drinks, and may beat his wife, and then on another visit to the hospital he will again be physicked, and so on. The man is not even referred to the poor-law infirmary for relief. Nor are conditions of home sanitation regarded. One cause of constant sickness is thus entirely overlooked, while drugs, otherwise unnecessary, are constantly given at the hospital. The hospitals are thus large isolated relief stations which are creating a new kind of pauperism. So far as the patients can pay—and many can do so—the general practitioners, to whom they would otherwise go, are deprived of their gains. Still worse is it when the hospital itself charges a fee in its out-patient department. The relief is then claimed even more absolutely as a right, and the general practitioners are still further injured. The doctors, as a medical staff, are not only medical men, but, whether they recognize the fact or not, they are also almsgivers or almoners; what they give is relief. Yet few or none of them have ever been trained for that work, and consequently they do not realize how very advantageous, even for the cure of their own patients, would be a thorough treatment of each case both at the hospital and outside it. Nor can they understand how their methods at present protract sickness and promote habitual dependence. Were this side of their work studied by them in any way they would be the first, probably, to press upon the governors of their hospitals the necessity for a change. Unfortunately, at present the governors are themselves untrained, and to finance the hospital and to make it a good institution is their sole object. Hospitals, however, are, after all, only a part of the general administration of charity, though as they are now managed they have seldom any systematic connexion with that administration. Nor is there any co-ordination

between the several hospitals and dispensaries. If one rightly refuses further treatment to certain applicants, they have only to wander to some other hospital, there to be admitted with little or no scrutiny. For usually out-patients and casualty patients are not even registered, nor can they be identified if they apply again. Practically they come and go at will. The definite limitation of cases, according to some standard of effectual work, association with general charity, trained almonership and inquiry, and a just regard for the interests of general practitioners, are stepping-stones to reform. In towns where medical charities are numerous a representative board would promote mutual help and organization.

Like the poor-law, endowed charities may be permanent institutions established to meet what should be passing and decreasing needs (cf. the arguments in *The State and Charity*, by T. Mackay). Administered as they usually are in isolation—**Endowed charities.** apart from the living voluntary charities of the generation, and consisting often of small trusts difficult to utilize satisfactorily, they tend to create a permanent demand which they meet by fixed quantities of relief. Also, as a rule, they make no systematic inquiries with a view to the verification of the statements of the applicants, for they have no staff for these purposes; nor have they the assistance of almoners or friendly visitors. Nor does the relief which they give form part of any plan of help in conjunction with other aid from without; nor is the administration subject to frequent inspection, as in the case of the poor-law. All these conditions have led to a want of progress in the actual administration of endowed charities, in regard to which it is often very difficult to prevent the exercise of an undue patronage. But there is no reason why these charities should not become a responsible part of the country's administration, aiding it to reduce outdoor pauperism. It was never intended that the poor-law should extinguish the endowed charities, still less, as statistics now prove, that where endowments abound the rate of pauperism should be considerably above the average of the rest of the country. This shows that these charities often foster pauperism instead of preventing it. As a step to reform, the publication of an annual register of endowed charities in England and Wales is greatly needed. The consolidating schemes of the charity commissioners have done much good; still more may be done in some counties by extending to the county the benefits of the charities of well-endowed towns, as has been accomplished by the extension of the eleemosynary endowments of the City of London to the metropolitan police area. Nor, again, until quite lately, and that as yet only in one or two schemes, has the principle been adopted that pensions or other relief should be given only in supplementation of the relief of relations, former employers, and friends, and not in substitution of it. Hence hitherto, in the main, the system has tended to weaken the family and to pauperize.

In many places funds are raised for the relief of school children by the supply of meals during the winter and spring. Usually a very large number of children are said to be underfed, but inquiry shows that such statements may be taken as altogether excessive. They are sometimes based on information drawn from the children at school, or sometimes on general deductions; they are seldom founded on any systematic and competent inquiry at the homes. When this has been made, the numbers dwindle to very small proportions. Teachers of experience have noted the effect of the meals in weakening the independence of the family. While they are forthcoming women sometimes give up cooking meals at home, use their money for other things, and tell the child he can get his meal at school. Great temptations are put before a parent to neglect her family, and very much distress is due to this. The meals—just at a time when, owing to the age of her children, the mother's care is most needed, and just in those families where the

Relief to children at school.

temptation is greatest and where the family instinct should be strengthened—stimulate this neglect. So in the case of the fathers: men who are lazy, and whose wives can earn a little, get the benefit of this help, and work for two or three days a week instead of for the whole week. Winter after winter, hard or mild, the meals are given, forgetful of the fact that man is made provident and responsible only by the pressure of nature; and thus winter, with its possibilities of want of employment, provides one of the strongest incentives to the practice of thrift, which, if it be encouraged, will do more for the health and contentment of the children than the meals of all their school life. Such relief, indeed, is wrong by all the canons of reasonable charity, and, appealing to the weakness of the poor, it creates an increasing demand which it cannot meet. Thus, for instance, in Paris the municipal subvention for the meals rose from 545,900 francs in 1892 to 912,885 francs in 1897, and the number of meals from 6,971,340 to 8,229,870. *Mutatis mutandis* the same result follows when charitable funds for the same purpose are forthcoming. The cause of distress in these cases is usually to be found in the home; the cases are comparatively few; being few, they should be systematically dealt with individually, with the object of preserving the family life; or, if the family be so vicious that its true life is entirely lost, and there is no alternative, as privately as possible some separate provision should be made for the children, so that they may grow up strong and healthy, to become the fathers and mothers of healthy families when they in turn make their start in life.

At a time of exceptional distress the following suggestions founded on much English experience may be of service. Usually

Exceptional distress.

at such a time proposals are made to establish special funds, and to provide employment to men and women out of work. But it is best, if possible, and as long as possible, to rely on existing agencies and to strengthen them. Round them there are usually workers more or less trained. A new fund usually draws to it new people, many of whom may not have had any special experience at all. If a new fund is inevitable, it is best that it should make its grants to existing agencies after consultation with them. In any case a clear policy should be adopted, and people should keep their heads. The exaggeration of feeling at a time of apprehended or actual distress is sometimes extraordinary, and the unwise action which it prompts is often a cause of continuing pauperism afterwards. Where there is public or poor-law relief the following plan may be adopted:—In any large town there are usually different recognized poor-law, charitable, or other areas. The local people already at work in these areas should be formed into local committees. In each case a quick inquiry should be made, and the relieving officer communicated with, some central facts verified, and the home visited. Roughly, cases may be divided into three classes: the irresponsible casual labouring class; a middle class of men with decent homes, who have made no provision for the future, and are not members of either friendly society or trades union; and a third class, who have made some provision. These usually are affected last of all; at all hazards they should be kept from receiving public relief, and should be helped, as far as possible, privately and personally. If there are public works, the second class might be referred to them; if there are not, probably some should be left to the poor-law, some assisted in the same way as members of class three. Much would turn upon the family and the home. The first class should be left to the poor-law. If there is no poor-law system at work they should be put on public works. Working men of independent position, not the creatures of any political club, but such as are respected members of a friendly society or are otherwise well qualified for the task, should be called into consultation. The relief should be settled according to the requirements of each case, but, if the pressure is great, at first at least it may be necessary to make grants according to some generally sufficient scale. There should be as constant a revision of cases as time permits. Great care should be taken to stop the relief as soon as possible, and to do nothing to make it the stepping-stone to permanent dependence.

As an alternative to relief, employment on public works is often suggested. It must be remembered, however, that where there is distress nothing should be done to prevent the migration of the workman, nothing to attract unsettled labour or vagrancy to the town. Employment, artificially provided, may cause as many difficulties as relief. If resort must be had to it, it should be work within the skill of all; it should be fairly remunerated, so that at least the scantiness of the pay may not be an excuse for neglect; and it should be paid for according to measured or piece work. The discipline should be strict, though due regard should be paid at first to those unaccustomed to digging or earthwork. In England and Wales the guardians have power to open labour yards. These, like charities which provide work, tend to attract and keep in employment a low class of labourer or workman, who finds it pays him to use the institution as a convenience. It is best, therefore, to avoid the opening of a labour yard, if possible.

If it is opened, the discipline should be very strict, and when there is laziness or insubordination, relief in the workhouse should at once be offered. The relief furnished to men employed in a labour yard, of which in England at least half has to be given in kind, should, it has been said, be dealt out from day to day. This leads to the men giving up the work sooner than they otherwise would. They have less to spend.

In some of the English colonies Homeric hospitality still prevails, but by degrees the station-house or some refuge is established in the towns as they grow more populous. Finally, some system of labour in exchange for relief is evolved. At first this is voluntary, afterwards it is officially recognized, and finally it may become part of the system of public relief. As bad years come, these changes are made step by step. In England the vagrant or wayfarer is tolerated and discouraged, but not kept employed. He should maintain himself, it is thought. His relief is public relief, and now, usually after he has had a bath and food, he is admitted to a separate room or cell in a casual ward. Before he leaves he has to do a task of work, and, subject to the discretion of the master, he is detained two nights. This plan has reduced vagrancy, and, if it were universally adopted, clean accommodation would everywhere be provided for the vagrant without the attractions of a common or "associate" ward; and probably vagrancy would diminish still further. It seems almost needless to say that in these circumstances, at any rate, casual alms should not be given to vagrants. They know much better how to provide for themselves than the almsgiver imagines, for vagrancy is in the main a mode of life not the result of any casual difficulty. Vagrancy and criminality are also nearly allied. The magistrate, therefore, rather than the almsgiver, should usually interfere; and, as a rule, where the magistrates are strict vagrancy in a county diminishes. Still undoubtedly vagrancy has its economic side. In a bad year the number of tramps is increased by the addition of unskilled and irresponsible labourers, who are soonest discharged when work is slack. As a part-voluntary system under official recognition the German *Arbeiter-colonien* are of interest. This in a measure has led to the introduction of labour homes in England, the justification of which should be that they recruit the energy of the men who find their way to them, and enable them to earn a living which they could not do otherwise. In a small percentage of cases this result may be achieved. Charitable refuges or philanthropic common lodging-houses, usually established in districts where this class already congregate, only aggravate the difficulty. They give additional attractions to a vagrant and casual life, and make it more endurable. They also make a comfortable avoidance of the responsibilities of family life comparatively easy, and, in so far as they do this, they are clearly injurious to the community.

The English colonists of the New England states and Pennsylvania introduced the disciplinary religious and relief system of Protestantism and the Elizabethan poor-law. To the former reference has already been made. With an appreciation of the fact that the cause of distress is not usually poverty, but weakness of character and want of judgment, and that relief is in itself no remedy, those who have inherited the old Puritan traditions have, in the light of toleration and a larger social experience, organized the method of friendly visiting, the object of which is illustrated by the motto "Not alms, but a friend." To the friendship of charity is thus given a disciplinary force, capable of immense expansion and usefulness, if the friendship on the side of those who would help is sincere and guided by practical knowledge and sagacity, and if on the side of those in distress there is awakened a reciprocal regard and a willingness to change their way of life by

United States of America.

degrees. Visiting by "districts" is set aside, for "friendliness" is not a quality easily diffused over a wide area. To be real it must be limited as time and ability allow. Consequently, a friendly visitor usually befriends but one or two, or in any case only a few, families. The friendly visitor is the outcome of the movement for "associated charities," but in America charity organization societies have also adopted the term and to a certain extent the method. Between the two movements there is the closest affinity. The registration of applicants for relief is much more complete in American cities than in England, where the plan meets with comparatively little support. At the office of the associated charities in Boston there is a central and practically a complete register of all the applications made to the public authority for poor relief, to the associated charities, and to many other voluntary bodies.

The Elizabethan poor-law system, with the machinery of overseers, poor-houses, and out-door relief, is still maintained in the New England states and Pennsylvania, but with many modifications, especially in New York State. A chief factor in these changes has been immigration. While the county or town remained the administrative area for local poor relief, the large number of immigrant and "unsettled" poor, and the business connected with their removal from the state, entailed the establishment of a secondary or state system of administration and aid, with special classes of institutions to which the counties or towns could send their poor, as, for instance, state reform schools, farms, almshouses, &c. For the oversight of these institutions, and often of prisons also and lunatic asylums, in many states there have been established state boards of "charity or corrections and charity." The members of these boards are selected by the state for a term of years, and give their services honorarily. There are state boards in Massachusetts, New York, Rhode Island, Pennsylvania, Minnesota, Michigan, Wisconsin, Iowa, Colorado, and elsewhere. There is also a district board of charities in the district of Columbia. These boards publish most useful and detailed reports. Besides the state board there is sometimes also, as in New York State, a State Charities Aid Association, whose members, in the counties in which they reside, have a legal right of entry to visit and inspect any public or charitable institution owned by the state and any county and other poor-house. A large association of visitors accustomed to inspect and report on institutions has thus been created. Further, the counties and towns in New York State, for instance, and Massachusetts, and the almshouse districts in Pennsylvania, are under boards of supervision. Usually the overseers give out-door relief, and the pauperism of some areas is as high as that in some English unions, 3, 4, and 5 per cent. On the whole population of the States, however, and of individual states, consisting to a great extent of comparatively young and energetic immigrants, the pauperism is insignificant. In Massachusetts "it has been the general policy of the state to order the removal to the state almshouse of unsettled residents of the several cities and towns in need of temporary aid, thus avoiding some of the abuses incident to out-door relief." In New York State, in the city of New York, including Brooklyn, the distribution of outdoor relief by the department of charities is forbidden, except for purposes of transportation and for the adult blind. Most counties in the state have an almshouse, and the county superintendents and overseers of the poor "furnish necessary relief to such of the county poor as may require only temporary assistance, or are so disabled that they cannot be safely removed to the almshouse." Public attention is in many cases being drawn to the inutility and injury of out-door relief.

In some states and cities the system of subsidizing

voluntary institutions is in full force, and it is in force also in many English colonies. At first sight it has the advantage of providing relief for public purposes without the creation of a new staff or establishment. There is thus an apparent economy. But the evils are many. Political partisanship and favour may influence the amount and disposition of the grants. The grants act as a bounty on the establishment and continuance of charitable institutions, homes for children, hospitals, &c., but not on the expansion of the voluntary charitable funds and efforts that should maintain them; and thus charitable homes exist in which charity in its truer sense may have little part, but in which the chief motive of the administration may be to support sectarian interests by public subsidies. Claimants for relief have little scruple in turning such institutions to their own account; and the institutions, being financially irresponsible, are not in these circumstances scrupulous on their side to prevent a misdirection of their bounties. "Parents unload their children upon the community more recklessly when they know that such children will be provided for in private orphan asylums and protectories, where the religious training that the parents prefer will be given them" (Amos G. Warner, in *International Congress: Charities and Correction*, 1893). Sometimes, as in New York, the admission is entirely in the hands of the managers. They admit; the city pays. In New York City the population between 1870 and 1890 increased about 80 per cent.; the subsidies for prisoners and public paupers increased by 43 per cent., but those for paupers in private institutions increased from \$334,828 to \$1,845,872, or about 461 per cent. The total was at that time \$3,794,972; in 1898 it was rather less, \$3,132,786. The alternative to this system is either the establishment of state or municipal institutions, and possibly in special cases payments to voluntary homes for the maintenance of inmates admitted at the request of a state authority, as at certified and other homes in England, with grants made conditional on the work being conducted on specified lines, and subject to a certain increasing amount of voluntary financial support; or a close general and financial inspection of charitable institutions; or payment for only those inmates who are sent by public authorities and admitted on their request.

The enormous extent to which children's aid societies have been increased in the United States, sometimes with the help of considerable public grants, suggests the greatest need for caution from the point of the preservation of the family as the central element of social strength in the community. The problem of charity in relation to medical relief in the large towns of the United States is similar to that of England: its difficulties are alike.

BOOKS.—As good translations of the classics become accessible it is easy for the general reader or student to combine a study of the principles of charity in relation to the community with a study of history. Thus, and in connexion with some special investigations (such as those made by Mr Charles Booth) and the conditions of practical charity, social economics may best be studied. In *Chalmers on Charity*, N. MASTERMAN (1900), *Methods of Social Reform*, T. MACKAY, and *Some Aspects of the Social Problem*, this point of view is generally assumed. For the history of charity there is no good single work. On details there are many good articles in Daremberg's *Dictionary of Classical Antiquities*, and in other similar works. Apart from books and official documents mentioned in the text as to the present state of charitable and public relief, or as aids to practical work, the following may be of service:—**England:** *Annual Charities' Register and Digest, with Introduction on "How to help Cases of Distress"* (1901); the *Charity Organisation Review*; and *Reports of Proceedings of Conferences of Poor-Law Guardians; Occasional Papers* (two vols.), published by the London Charity Organisation Society (1896 and 1900). **United States of America:** *The Proceedings of the International Conference on Charities and Correction* (1894), and the proceedings of the annual conferences.—*Friendly Visiting among the Poor*, by MARY E. RICHMOND (1899); *American*

Charities, by AMOS G. WARNER (1895).—*Handwörterbuch der Staatswissenschaften*, Dr J. CONRAD, &c., vol. ii. supplement: *Das Armenwesen in den Vereinigten Staaten von America*, Dr FRANCIS G. PRABUDY (1897).—*The Charities Review*, published monthly by the New York Charity Organisation Society. The Papers and Reports of the Boston and Baltimore societies. France: *La Bibliographie charitable*, by CAMILLE GRANIER (1891).—*La Charité avant et depuis 1789*, by P. HUBERT VALLEROUX. —Fascicules of the Conseil Supérieur de l'assistance publique. —*Revue d'Assistance*, published by the Société internationale pour l'étude des questions d'assistance. Germany: *Reports and Proceedings of the Deutsche Verein für Armenpflege und Wohlthätigkeit*; *Die Armenpflege*, a practical handbook, by Dr E. MÜNSTERBERG, 1897. Austria: *Oesterreichs Wohlfahrts-Einrichtungen*, 1848-98; Dr ERNEST MISCHLER, 1899. (C. S. L.)

Charjui, town of Russia, Transcaspian territory, 74 miles by rail S.W. of Bokhara, and 662 miles by rail from Krasnovodsk. It is a great entrepôt for raw cotton. There is a railway bridge across the Amu-Daria.

Charkhari, a native state of India, in the Bundelkhand agency. Area, 788 square miles; population (1891), 143,108; average density, 183 persons per square mile; estimated revenue, Rs.5,00,000. The chief, whose title is maharaja, is a Rajput of the Bundela clan, descended from Chhatar Sal, the champion of the independence of Bundelkhand in the 18th century. The town of CHARKHARI is situated in 25° 44' N. lat. and 79° 47' E. long., about 40 miles W. of Banda.

Charleroi, a town of Belgium, in the province of Hainaut, 23 miles E. of Mons, on the Sambre, at an important junction of railways. In 1886 Socialist excesses led to sanguinary encounters with the forces of order. The output of coal still continues on an extensive scale. Population (1880), 16,372; (1897), 23,480.

Charleroi, a borough of Washington county, Pennsylvania, U.S.A., on the Monongahela river and a branch of the Pennsylvania railway. It is an iron manufacturing town of recent growth. Population (1900), 5930.

Charles (KARL EITEL ZEPHYRIN LUDWIG), King of Rumania (1839—), second son of Prince Karl Anton of Hohenzollern, was born 20th April 1839. He was educated at Dresden, 1850-56, and passed through his university course at Bonn. Entering the Prussian army in 1859, he won considerable distinction in the Danish war of 1864, and was a captain in the 2nd regiment of Dragoon Guards when he was elected crown prince of Rumania, 20th April 1866, after the compulsory abdication of Prince Alexander John Couza. Regarded at first with distrust by Turkey, Russia, and Austria, he succeeded in gaining general recognition within six months; but he had to contend for ten years with the fierce party struggles that raged between the Boyars and the Liberals until the latter were finally victorious in 1876. During this period, however, Charles displayed great tact in his dealings with both parties, and kept his country in the path of administrative and economical reform, organizing the army, developing the railways, and establishing commercial relations with foreign powers. The sympathy of Rumania with France in the Franco-Prussian war, and the consequent interruption of certain commercial undertakings, led to a hostile movement against Prince Charles, which, being fostered by Russia, made him resolve to abdicate, and it was with difficulty that he was persuaded to remain. In the Russo-Turkish war of 1877-78 he hurried to the help of the Russians before Plevna, and being placed in command of the combined Russian and Rumanian forces, he captured the enemy's camp and took Osman Pasha prisoner. As a consequence of the prince's vigorous action the independence of Rumania, which had been proclaimed in May 1877, was confirmed by various treaties in 1878, and recognized by Great Britain, France, and Germany in

1880. On 26th March 1881 Prince Charles (Carol) was proclaimed king of Rumania, and was crowned with his consort on the 23rd May following. From that time he has pursued a successful career in home and foreign policy, and has raised the financial and military position of his country far beyond that of the other Balkan states, while his appreciation of the fine arts has been shown by the formation of an important collection of paintings of all schools in his palaces at Sinaita and Bucarest. His consort, the Queen ELIZABETH (Pauline Elizabeth Ottilie Louise), widely known by her literary name "Carmen Sylva," was born 29th December 1843, being the daughter of Prince Hermann of Neuwied. She first met the future king of Rumania at Berlin in 1861, and was married to him 15th November 1869. Early distinguished by her excellence as a pianist, organist, and singer, she also showed considerable ability in painting and illuminating; but a lively poetic imagination has led her to the path of literature, and more especially to poetry, folklore, and ballads. In addition to numerous original works, she has put into literary form many of the legends current among the Rumanian peasantry. In the Russo-Turkish war of 1877-78 she devoted herself to the care of the wounded, and founded the Order of Elizabeth (a gold cross on a blue ribbon) to reward distinguished service in such work. She fostered the higher education of women in Rumania, and established societies for various charitable objects. The following is the chronicle of her literary work, the books marked with an asterisk being written in collaboration with Frau Mite Kremnitz:—1880, *Sappho*, *Hammerstein*; 1881, *Stürme*, *Rumänische Dichtungen* (translations); 1882, *Leidens Erdengang*, *Jehovah*, *Ein Gebet*, *Pensées d'une Reine*, *Die Heze*, *Aus Zwei Welten**; 1883, *Das Leben meines Bruders*, *Aus Carmen Sylva's Königreich* (in two parts: I. *Pelesch-Märchen*; II. *Durch die Jahrhunderte*); 1884, *Handzeichnungen*, *Mein Rhein*, *Meine Ruh*, *Pelesch im Dienst*; 1885, *Mein Buch*; 1886, *Feldpost*, *Astra**, *Anna Boleyn**; 1887, *Es Klopft*, *In der Irre**; 1888, *Cuvinte Suflutesci*, *Rache**, *Inlandfischer* (from the French of Pierre Loti); 1889, *Lieder aus dem Dimbovitza-thal* (from the Rumanian of H. Văcărescu); 1890, *Frauenmuth*, *Deficit*, *Vom Anbiss*; 1891, *Handwerkerlieder*, *Meerlieder*, *Heimath*, *Weihnachtskerzen*; 1892, *Meister Manole*, *Bucarest* (in *Les Capitales du Monde*).

As the only child of the marriage, a daughter, died in 1874, the succession was finally settled upon the king's nephew, Prince Ferdinand of Hohenzollern-Sigmaringen, who was created prince of Rumania, 18th March 1889, and who married, on 10th January 1893, Princess Marie, daughter of the late Duke Alfred of Saxe-Coburg. Their children are Prince Carol (b. 1893) and Princess Elizabeth (b. 1894).

Charleston, capital of Coles county, Illinois, U.S.A., at the intersection of the Cleveland, Cincinnati, Chicago, and St Louis, and the Toledo, St Louis, and Kansas City railways. Population (1890), 4135; (1900), 5488, of whom 139 were foreign-born and 45 negroes.

Charleston, the principal city and seaport of South Carolina, U.S.A., capital of Charleston county, situated on a peninsula between Ashley and Cooper rivers in 32° 46' N. lat. and 79° 56' W. long. It has three railways, the Atlantic Coast Line, the Plant System, and the South Carolina and Georgia, which bring to it the products of the interior—cotton, phosphates, and turpentine. The bar at the entrance to its deep and spacious harbour has been cut away by the use of jetties, so as to make entrance for vessels of 24·5 feet draught. In 1898 the export trade amounted to \$11,440,130, and consisted mainly of cotton and phosphates. There are regular

steamship lines to the great northern and southern seaports. Charleston is thus a commercial rather than a manufacturing city, but its manufactures had in 1898 a capital of \$7,345,000, employed 5500 persons, and the output was valued at \$9,000,000. The College of Charleston, founded in 1785, had in 1898 a faculty of six professors and an attendance of 36 students. It had property valued at \$372,000, and an income of \$12,627. The city contains also the South Carolina Military Academy. The assessed valuation of real and personal property (the former being assessed on a basis of about 40 per cent. of the full value) was in 1900, \$17,246,142, the net debt of the corporation was \$3,798,200, and the municipal tax rate \$29.50 per \$1000. The death-rate in 1900 was 37.5 per 1000. In 1886 an earthquake destroyed a large part of the city, and many lives were lost, but the city has been rebuilt and few traces of the disaster remain. Population (1880), 49,984; (1890), 54,955; (1900), 55,807, of whom 2592 were foreign-born and 31,522 were negroes. Out of 14,167 males of voting age 2259 were illiterate (unable to write), of whom 2163 were negroes. The city has profited by the deepening of its harbour entrance, and also by the discovery of valuable beds of phosphates in the neighbourhood.

Charleston, a city of West Virginia, U.S.A., capital of Kanawha county and of the state. It is situated near the centre of the state, in 38° 22' N. lat. and 81° 38' W. long., on the north bank of Kanawha river, at the mouth of Elk river, at an altitude of 600 feet. It has a level site on land lying above the river, and the plan is regular. Among its buildings is a fine new state capitol. It is on the main line of the Chesapeake and Ohio railway, and is entered by two smaller railways. It has large traffic by rail and river, especially in the shipment of bituminous coal. This is mined from horizontal beds, which outcrop on the face of the river bluffs in the neighbourhood. Population (1880), 4192; (1890), 6742; (1900), 11,099.

Charlotte, capital of Mecklenburg county, North Carolina, U.S.A., situated in the south-western part of the state, on the Southern railway and on two branches of the Seaboard Air line. It is at an altitude of 725 feet, is surrounded by a fertile farming district, and is a shipping-point for cotton and tobacco. Biddle University and Elizabeth College are situated in this place. Population (1880), 7094; (1890), 11,557; (1900), 18,091, of whom 287 were foreign-born and 7151 were negroes.

Charlottenburg, a town of Prussia, on the Spree, lying immediately to the west of Berlin, of which it practically forms the entire western suburb. Although retaining its own municipal government, it was in 1900, together with the adjacent suburban towns of Schöneberg and Rixdorf, included in the police district of the capital. Of new public buildings, the technical academy and the Kaiser Wilhelm memorial church are referred to in the article BERLIN. There are also a new Catholic church and two high schools for music and art respectively. It was in the Schloss that the Emperor Frederick III. took over the reins of government in 1888, and resided for nearly the whole of his three months' reign. In the mausoleum in the castle grounds the Emperor William I. and the Empress Augusta lie interred in two white marble sarcophagi—masterpieces of the sculptor Encke. In addition to the famous royal porcelain manufactory, which has of late been much enlarged, Charlottenburg has many flourishing industries, notably iron-works, grouped along the banks of the Spree. Its main streets are laid out on a spacious plan, while there are many quiet streets containing pretty villa residences. Population (1880), 30,483; (1890), 76,859; (1900), 189,290.

Charlottesville, a city of Virginia, U.S.A., situated a little north of the centre of the state, in the Piedmont region, on Rivanna river, at an altitude of 451 feet. Though within Albemarle county, and containing the court-house, it is independent of the county government. It is entered by the Chesapeake and Ohio and the Southern railways. The University of Virginia, near Charlottesville, had, in 1898, 24 professors and was attended by 489 students. Its property was valued at nearly \$1,500,000, and its total income was \$125,000. Population (1880), 2676; (1890), 5591; (1900), 6449.

Charlottetown, a city of Canada, the capital of Prince Edward Island, situated on Hillsborough river. It is well supplied with gas, electric light, and splendid water-works, and contains 8 churches, 3 banks, 3 daily and 6 weekly newspapers, and numerous factories. It exports large quantities of butter, cheese, potatoes, &c. The head offices and workshops of the Prince Edward Island railway are situated here. For the fiscal year 1900 the exports were \$1,147,574 and the imports \$435,032. Population, about 12,000.

CHARTERED COMPANIES.

A CHARTERED company is a trading corporation enjoying certain rights and privileges, and bound by certain obligations under a special charter granted to it by the sovereign authority of the State, such charter defining and limiting those rights, privileges, and obligations, and the localities in which they are to be exercised. Such companies existed in early times, but have undergone changes and modifications in accordance with the developments which have taken place in the economic history of the states where they have existed. For the influence of the early trading companies on mediæval industry and commerce the reader is referred to the articles COMMERCE, SHIPPING, and HANSEATIC LEAGUE, in the ninth edition of this work. In Great Britain the first trading charters were granted, not to English companies, which were then non-existent, but to branches of the Hanseatic League, and it was not till 1597 that England was finally relieved from the presence of a foreign chartered company. In that year Queen Elizabeth closed the steel-yard where Teutons had been established for 700 years.

The origin of all English trading companies is to be sought in the Merchants of the Staple. They lingered on into the 18th century, but only as a name, for their business was solely to export English products which, as English manufactures grew, were wanted at home. Of all early English chartered companies, the "Merchant Adventurers" conducted its operations the most widely. Itself a development of very early trading guilds, at the height of its prosperity it employed as many as 50,000 persons in the Netherlands, and the enormous influence it was able to exercise undoubtedly saved Antwerp from the institution of the Inquisition within its walls in the time of Charles V. In the reign of Elizabeth British trade with the Netherlands reached in one year 12,000,000 ducats, and in that of James I. the company's yearly commerce with Germany and the Netherlands was as much as £1,000,000. Hamburg afterwards was its principal depot, and it became known as the "Hamburg Company." In the "Merchant Adventurers'" enterprises is to be seen the germ of the trading companies which had so remarkable a development in the 16th and 17th centuries.

The early chartered companies.

These old regulated trade guilds passed gradually into joint stock associations, which were capable of far greater extension, both as to the number of members and amount of stock, each member being only accountable for the amount of his own stock, and being able to transfer it at will to any other person.

It was in the age of Elizabeth and the early Stuarts that the chartered company, in the modern sense of the term, had its rise. The discovery of the New World, and the opening out of fresh trading routes to the Indies, gave an extraordinary impulse to shipping, commerce, and industrial enterprise throughout Western Europe. The English, French, and Dutch Governments were ready to assist trade by the granting of charters to trading associations. It is to the "Russia Company," which received its first charter in 1554, that Great Britain owed its first intercourse with an empire then almost unknown (see art. RUSSIA, *Ency. Brit.* vol. xxi.). The first recorded instance of a purely chartered company annexing territory is to be found in the action of this company in setting up a cross at Spitzbergen in 1613 with King James's arms upon it. Among other associations trading to the continent of Europe, receiving charters at this time, were the Turkey Company and the Eastland Company. Both the Russia and Turkey Companies had an important effect upon British relations with those empires. They maintained British influence in those countries, and even paid the expenses of the embassies which were sent out by the English Government to their courts. The Russia Company carried on a large trade with Persia through Russian territory; but from various causes their business gradually declined, though the Turkey Company existed in name until 1825.

The chartered companies which were formed during this period for trade with the Indies and the New World have had a more wide-reaching influence in history. The extraordinary career of the East India Company is told in *Ency. Brit.* vol. xii. p. 798.

Charters were given to companies trading to Guinea, Morocco, Guiana, and the Canaries, but none of these enjoyed a very long or prosperous existence, principally owing to the difficulties caused by foreign competition. It is when we turn to North America that the importance of the chartered company, as a colonizing rather than a trading agency, is seen in its full development. The "Hudson Bay Company," which still exists as a commercial concern, is dealt with in detail in *Ency. Brit.* vol. xii. p. 333, but most of the thirteen British North American colonies were in their inception chartered companies very much in the modern acceptance of the term. The history of these companies will be found under the heading of the different colonies of which they were the origin. It is necessary, however, to bear in mind that two classes of charters are to be found in force among the early American colonies: (1) Those granted to trading associations, which were often useful when the colony was first founded, but which formed a serious obstacle to its progress when the country had become settled and was looking forward to commercial expansion; the existence of these charters then often led to serious conflicts between the grantees of the charter and the colonists; ultimately elective assemblies everywhere superseded control by trading companies. (2) The second class of charters were those granted to the settlers themselves, to protect them against the oppressions of the Crown and the provincial governors. These were highly prized by the colonists.

In France and Holland, no less than in England, the institution of chartered companies became a settled principle of the Governments of those countries during the whole of the period in question. In France, from

1599 to 1789, more than 70 of such companies came into existence, but after 1770, when the great "Compagnie des Indes Orientales" went into liquidation, they were almost abandoned, and finally perished in the general sweeping away of privileges which followed on the outbreak of the Revolution.

If we inquire into the economic ideas which induced the granting of charters to these earlier companies and animated their promoters, we shall find that they were entirely consistent with the general principles of government at the time and what were then held to be sound commercial views. Under the old régime everything was a matter of monopoly and privilege, and to this state of things the constitution of the old companies corresponded, the sovereign rights accorded to them being also quite in accordance with the views of the time. It would have been thought impossible then that private individuals could have found the funds or maintained the magnitude of such enterprises. It was only this necessity which induced statesmen like Colbert to countenance them, and Montesquieu took the same view (*Esprit des Lois*, t. xx. c. 10). John de Witt's view was that such companies were not useful for colonization properly so called, because they want quick returns to pay their dividends. So, even in France and Holland, opinion was by no means settled as to their utility. In England historic protests were made against such monopolies, but the chartered companies were less exclusive in England than in either France or Holland, the governors of provinces almost always allowing strangers to trade on receiving some pecuniary inducement. French commercial companies were more privileged, exclusive, and artificial than those in Holland and England. Those of Holland may be said to have been national enterprises. French companies rested more than did their rivals on false principles; they were more fettered by the royal power, and had less initiative of their own, and therefore had less chance of surviving. As an example of the kind of rules which prevented the growth of the French companies, it may be pointed out that no Protestants were allowed to take part in them. State subventions, rather than commerce or colonization, were often their object; but that has been a characteristic of French colonial enterprise at all times.

Such companies, however, under the old commercial system could hardly have come into existence without exclusive privileges. Their existence might have been prolonged had the whole people in time been allowed the chance of participating in them.

To sum up the causes of failure of the old chartered companies, they are to be attributed to (1) bad administration; (2) want of capital and credit; (3) bad economic organization; (4) distribution of dividends made prematurely or fictitiously. But those survived the longest which extended the most widely their privileges to outsiders. According to contemporary protests, they had a most injurious effect on the commerce of the countries where they had their rise. They were monopolies, and therefore, of course, obnoxious; and it is undoubted that the colonies they founded only became prosperous when they had escaped from their yoke.

On the other hand, it must not be forgotten that they contributed in no small degree to the commercial progress of their own states. They gave colonies to the mother country, and an impulse to the development of its fleet. In the case of England and Holland, the enterprise of the companies saved them from suffering from the monopolies of Spain and Portugal, and the wars of the English, and those of the Dutch in the Indies with Spain and Portugal, were paid for by the companies. They furnished the

mother country with luxuries which, by the 18th century, had become necessities. They offered a career for the younger sons of good families, and sometimes greatly assisted large and useful enterprises.

During the last twenty years of the 19th century there was a great revival of the system of chartered companies in Great Britain. It is a feature of the general growth of interest in colonial expansion and commercial development which has made itself felt almost universally among European nations. Great Britain, however, alone has succeeded in establishing such companies as have materially contributed to the growth of her empire. These companies succeed or fail for reasons different from those which affected the chartered companies of former days, though there are points in common. Apart from causes inherent in the particular case of each company, which necessitates their being examined separately, recent experience leads us to lay down certain general principles regarding them. The modern companies are not like those of the 16th and 17th centuries. They are not privileged in the sense that those companies were. They are not monopolists; they have only a limited sovereignty, always being subject to the control of the home Government. It is true that they have certain advantages given them, for without these advantages no capital would risk itself in the lands where they carry on their operations. They often have very heavy corresponding obligations, as will be seen in the case of one (the East Africa) where the obligations were too onerous for the company to discharge, though they were inseparable from its position. The charters of modern companies differ in two points strongly from those of the old: they contain clauses prohibiting any monopoly of trade, and they generally confer some special political rights directly under the control of the secretary of state. The political freedom of the old companies was much greater. In these charters State control has been made a distinguishing feature. It is to be exercised in almost all directions in which the companies may come into contact with matters political. Of course, it is inevitable in all disputes of the companies with foreign Powers, and is extended over all decrees of the company regarding the administration of its territories, the taxation of natives, and mining regulations. In all cases of dispute between the companies and the natives the secretary of state is *ex officio* the judge, and to the secretary of state (in the case of the South Africa Company) the accounts of administration have to be submitted for his approbation. It is deserving of notice that the British character of the company is insisted upon in each case in the charter which calls it into life. The Crown always retains complete control over the company by reserving to itself the power of revoking the charter in case of the neglect of its stipulations. There are special clauses in the charters of the British East Africa and South Africa Companies enabling the Government to forfeit their charters if they do not promote the objects alleged as reasons for demanding a charter. This binds them still more strongly, and in the case of the South Africa Company the duration of the charter is fixed at twenty-five years.

The chartered company of these days is therefore very strongly fixed within limits imposed by law on its political action. As a whole, however, very remarkable results have been achieved. This may be attributed in no small degree to the personality of the men who have had the supreme direction at home and abroad, and who have, by their social position and personal qualities, acquired the confidence of the public. With the exception of the Royal Niger Company, it would

be incorrect to say that they have been financially successful, but in the domain of government and colonization they have achieved remarkable results. This may be seen more clearly by considering each case by itself, but generally it may be said that they have added vast territories to the British empire (in Africa about 1,700,000 square miles), and in these territories they have acted as a civilizing force. They have made roads, opened facilities for trade, enforced peace, and laid at all events the foundation of settled administration. It is not too much to say that they have often acted unselfishly for the benefit of the mother country and even humanity. We may instance the anti-slavery and anti-alcohol campaigns which have been carried on, the latter certainly being against the immediate pecuniary interests of the companies themselves. It must, of course, be recognized that to a certain extent this has been done under the influence of the home Government. The occupation of Uganda certainly, and of the Upper Niger territory and Rhodesia probably, will prove to have been rather for the benefit of posterity than of the companies which effected it. In the two cases where the companies have been bought out by the State, they have had no compensation for much that they have expended. In fact, it would have been impossible to take into account actual expenditure day by day, and the cost of wars. To use the expression of Sir William Mackinnon, the shareholders have been compelled in some cases to "take out their dividends in philanthropy."

The existence of such companies to-day is justified in certain political and economic conditions only. It may be highly desirable for the Government to occupy certain territories, but political exigencies at home will not permit it to incur the expenditure, or international relations may make such an undertaking inexpedient at the time. In such a case the formation of a chartered company may be the best way out of the difficulty. But it has been demonstrated again and again that, directly the company's interests begin to clash with those of foreign Powers, the home Government must assume a protectorate over its territories in order to simplify the situation and save perhaps disastrous collisions. So long as the political relations of such a company are with savages or semi-savages, it may be left free to act, but directly it becomes involved with a civilized Power the State has (if it wishes to retain the territory) to acquire by purchase the political rights of the company, and it is obviously much easier to induce a popular assembly to grant money for the purpose of maintaining rights already existing than to acquire new ones. With the strict system of Government supervision enforced by the modern charters it is not easy for the State to be involved against its will in foreign complications. Economically such companies are also justifiable up to a certain point. When there is no other means of entering into commercial relations with remote and savage races save by enterprise of such magnitude that private individuals could not incur the risk involved, then a company may be well entrusted with special privileges for the purpose, as an inventor is accorded a certain protection by law by means of a patent which enables him to bring out his invention at a profit if there is anything in it. But such privileges should not be continued longer than is necessary for the purpose of reasonably recompensing the adventurers. A successful company, even when it has lost monopoly or privileges, has, by its command of capital and general resources, established so strong a position that private individuals or new companies can rarely compete with it successfully. This is clearly shown in the case of the Hudson Bay Company as at present constituted, and it will probably be so in the case of the Niger and North Borneo Companies. In colonizing new lands these

companies often act successfully. They have proved more potent than the direct action of governments. This may be seen in Africa, where France and England have of late acquired vast areas, but have developed them with very different results, acting from the opposite principles of private and State promotion of colonization. Apart from national characteristics, the individual has far more to gain under the British system of private enterprise. A strong point in favour of some of the British companies has been that their undertakings have been practically extensions of existing British colonies rather than entirely isolated ventures. But a chartered company can never be anything but a transition stage of colonization; sooner or later the State must take the lead. A company may act beneficially so long as a country is undeveloped, but as soon as it becomes even semi-civilized its conflicts with private interests become so frequent and serious that its authority has to make way for that of the central Government.

The companies which have been formed in France during recent years do not yet afford material for profitable study, for they have been subject to so much vexatious interference from home owing to lack of a fixed system of control sanctioned by Government, that they have not been able, like the British, to develop along their own lines.

In the sketch which follows of certain chartered companies which have existed since 1880, or still exist, the application of the principles stated above may be seen.

THE BRITISH SOUTH AFRICA COMPANY.

At the time when this company received its charter of incorporation, October 1889, South Africa was inhabited by three races exclusive of native tribes—the British, the Portuguese, and the Dutch. The first named held roughly the south, the Portuguese retained little more than the eastern coast-line from Beira to Delagoa Bay, while more in the centre lay the Dutch republics of the Transvaal and Orange Free State. Germany had shortly before established herself on the west. Meanwhile in the central portion of the country north of the Transvaal and Bechuanaland lay the extensive territories of various native tribes, among whom the Mashonas and the warlike Matabele occupied the richest and largest areas. These tribes were under the sway of one powerful chief, Lo-Bengula, whose royal kraal was situated at Bulawayo. The portion of these territories known as Matabeleland had before 1889 only been traversed by explorers such as Kirk, Baines, and Livingstone, but the reports they had brought back of its fertility, and especially its mineral wealth, had excited the cupidity and enterprise of white people, and the prompt action of Mr Cecil Rhodes and others alone saved them for the British flag. Mr Rhodes, after consolidating the conflicting interests of different owners into the great diamond-mining company of De Beers, had devoted his energies to the development of South Africa, and had become the life and soul of its financial enterprises. His was the guiding hand which directed British adventure into these vast fields of promise. Before 1888 Lo-Bengula had had frequent relations with foreign "prospectors." Among them two Englishmen, Mr Baines in 1871 and Sir John Swinburne in 1872, had obtained concessions of mineral rights, but little effort had been made to put them in force. Now the neighbouring nations began to move, but in 1888 the British Government, at the instance of Sir Sidney Shippard, K.C.M.G., then administrator of British Bechuanaland, took steps which for ever excluded other nationalities from acquiring control over the country. On the 11th February of that year Lo-Bengula signed a treaty of peace and amity with Great Britain, under which he agreed that he would

refrain from entering into any correspondence or treaty with any foreign State or Power without the previous knowledge and sanction of H.B.M.'s high commissioner for South Africa. Shortly after the conclusion of this treaty, representatives of influential syndicates directed by Mr Rhodes were sent, with the knowledge of the British Government and the high commissioner, to negotiate with Lo-Bengula, and on the 30th October of the same year he concluded an arrangement with Messrs Rudd, Rochfort Maguire, and Thompson, by which, in return for the payment of £100 a month made to him by the syndicate, together with 1000 Martini-Henry rifles and 100,000 rounds of ammunition, he gave the syndicate complete control over all the metals and minerals in his kingdom, with power to exclude from his dominions "all persons seeking land, metals, minerals, or mining rights therein," in which action, if necessary, he promised to render them assistance. This concession once obtained, Mr Rhodes proceeded with rapidity to prosecute his great enterprise. He extinguished the interests of earlier concessionaires by purchase (giving, for instance, £10,046 for the Baines and Swinburne interests), and then formed "The Central Search Association," with a capital of £121,000. Of this total, £92,000 was represented by shares of £1, which were distributed to the shareholders in payment of rights they had surrendered or advances made, while the rest, to the number of 29,000 shares, was subscribed in ready money to be employed in preparing the ground for future operations. This pioneer company soon merged in "The United Concessions Company." The latter undertook to explore and develop, the former bought its concessions, and they were to share equally the profits. Before long these companies became the "British South Africa Company," commonly known as the "Chartered Company."

*Origin
of the
company.*

On 30th April 1889 Lord Gifford addressed to the British Government, on behalf of the founders, an outline of a scheme for the formation of a company to develop the Bechuanaland Protectorate and the territories lying to the north. It may be stated that Bechuanaland is native territory lying north of Cape Colony, between it and what was then Lo-Bengula's land, and west of the Transvaal. Bechuanaland had been occupied by England a few years previously and divided into two parts—the south a Crown colony and the north a protectorate only. The Government, having ascertained the substantial nature of the company's resources and the composition of the proposed directorate, and also that they were prepared to begin immediately the development of the country, granted the charter which bears date 29th October 1889.

The Charter.—A few points in the charter itself deserve to be noted. In the first place, it gives a considerable extension to the terms of the original concessions by Lo-Bengula. In short, it transforms the rights of working minerals and metals, and preventing others from doing so, into rights practically sovereign over the regions in which the company's activity is to be employed. These rights the Crown grants directly itself, not merely confirming a previous grant from another source. In this it differs from charters granted to other companies. By Article X. the company was empowered to "make ordinances (to be approved by our secretary of state), and may establish and maintain a force of police." A strict supervision is provided for, to be exercised by the secretary of state over the relations between the company and the natives. It is worth noting that in clause 1 (where the sphere of the company's operations is defined) its limits are very clearly laid down on all sides but the north, where it was left by implication entirely free. The British Government reserved to itself entire power to repeal the charter at any time that it did not consider the company was fulfilling its obligations or endeavouring duly to carry out the objects for which the charter was granted. The share capital of the company was fixed at £1,000,000 in shares of £1 each. The original directors were the duke of Abercorn, the duke of Fife, Lord Gifford, Mr (afterwards Earl) Grey, Mr Cawston, Mr Rhodes, and Mr A. Beit.

The company at the commencement of its operations had to deal with a country absolutely untouched by the hand of civilization. The size of the territory was 500,000 square miles at least, as large as France and Germany combined, ruled over by Lo-Bengula, whose power was supported by hordes of savage warriors. The only possessions of the natives were enormous herds of cattle; there was no cultivation of the soil or attempt to work its mineral riches. Of course there was at every step a grave danger of incurring the hostility of the natives. The first move of the company was to extend northwards the railway and the telegraph. In 1889 the former only went as far as Kimberley and the latter to Mafeking. The Cape Government agreed to make the railway to Vryburg, and the company was to continue it. A police force of 250 men under experienced officers was enrolled. In order to open up the new territories it was necessary to set on foot a pioneer expedition. This was done by an arrangement between the company and Mr Frank Johnson, who undertook to fit out and conduct the expedition on certain terms which included grants of reef claims and farms to each pioneer. Among the pioneers was Mr F. C. Selous, the well-known explorer. After the pioneer force had been duly inspected by General Lord Methuen, its advance was authorized by the high commissioner, and it set out in June 1890, accompanied by a force of police, the whole expedition being under the command of Lt.-Col. Pennefather. Its results were striking. It constructed a road 400 miles long, known as the "Selous Road"; it bridged streams; it established fortified stations at Tuli, Victoria, Charter, and Salisbury; it brought peace and security to Mashonaland, which had formerly been a prey to its more warlike neighbours—and all this without losing a rifle or firing a shot. Mashonaland was taken in hand by Mr A. R. Colquhoun, and its administration organized; but his health gave way, and he was succeeded by Dr Jameson. During the first two years of its occupation the white population of that country reached 3000. In 1891 the company successfully interfered to prevent a large Boer trek into the south-east portion of Matabeleland and the occupation by them of that territory by force. About this time there were serious threats that Germany would attempt to stretch her hinterland boundary across Lake Nyasa to the Congo State, but this was averted by the establishment of Forts Fife and Abercorn at the southern end of Lake Tanganyika and midway between the two lakes. The company also agreed to buy up a company called "The African Lakes Company," which had unsuccessfully endeavoured to open up the districts north of the Zambezi. This was a Scottish company founded in 1878 to protect the mission stations and to trade between the lakes of Mweru, Tanganyika, and Nyasa, but its capital had been expended in strife with the slave-traders. The shareholders in the "African Lakes Company" exchanged their shares for shares in the South Africa Company, and the latter in return acquired all their rights. By 1893 the absorption of that company in the South Africa Company was complete. In the early part of 1891 the British Government extended the field of the company's operations so as to include the whole of the British sphere immediately north of the Zambezi, except Nyasaland, towards the expense of the administration of which district the company was contributing at this time £10,000 a year. The imperial commissioner for Nyasaland was allowed to act also as administrator of the company's sphere north of the Zambezi, and in 1894 the Government took over all liabilities connected with this Nyasaland territory.

The company took early steps to open up its territory by the construction of railways and telegraphs. As has

been stated, the railway running north from Cape Town went no farther than Kimberley when the company began its operations, but in November 1889 the extension was taken in hand, and by December 1890 the section to Vryburg was open, about 120 miles; and at the same time the telegraph was carried on to Mafeking; by the end of 1892 the telegraph had reached Victoria. Meanwhile prospects of mining development had brought into the country a large number of settlers, who had marked out claims.

During the first three years the opening up of Mashonaland proceeded apace. Salisbury, Umtali, and Victoria began to grow into towns, and building plots fetched at the lowest £35. The company also entered upon a regular system of agricultural development, and by the end of 1892 as many as 500 concessions of farms had been made, and the number of immigrants in 1892 reached 1121. Administration had also been satisfactorily and rapidly organized. Dr Jameson reduced the standing police force to 40, and set on foot a volunteer corps which soon had 500 members. The Transvaal burgher system was also adopted, which allows the Government to demand on necessity the services of every able-bodied citizen, supplying him at the same time with rifle and ammunition. A regular postal service was established. Under Mr Selous the road system was completed, and the headquarters of the administrator were fixed at Salisbury.

Though Mashonaland was being civilized, Matabeleland was still the home of Lo-Bengula and his savage warriors. Their continued raids into the company's territories led to war, which broke out in July 1893 and lasted till the end of the year. This war cost the company 100 men and £110,000. Lo-Bengula died, and his lands passed under the sway of the company. Charges were made against the latter of having provoked the natives in order to bring on this war, but after inquiry they were expressly exonerated from the charge by Lord Ripon, then colonial secretary. The conditions under which Matabeleland was handed over to the company were set out in the "Matabeleland Order in Council" of 18th July 1894. The administrator was given a council of four to assist him. Local taxes and customs dues were to be fixed by the company with the approbation of the secretary of state. A high court and a land commission were established. Magistracies were established, and resident magistrates and civil commissioners appointed at Salisbury, Umtali, Victoria, and Tuli, with functions similar to those exercised by like officials in Cape Colony, the law administered being the Roman-Dutch law of that colony.

During 1894 and 1895 the company continued the development of its territory, now increased to 750,000 square miles. It stretched uninterruptedly to the southern end of Lake Tanganyika in the north, i.e., roughly to the 8th degree of latitude. This increase of territory led at first to a great increase of expenditure, and the original capital of £1,000,000 was raised to £2,000,000 by a resolution passed at an extraordinary meeting of the shareholders held in November 1893; and this was increased by another £500,000 in July 1895, and by further issues in 1896 and 1898.

By a proclamation of 3rd May 1895 the company's territory received officially the name of "Rhodesia," and was divided into three provinces, Mashonaland, Matabeleland, and Northern Zambezia. The two provinces comprising Southern Rhodesia were subdivided into districts. The districts, for convenience of administration, were grouped into fiscal and mining divisions, and the civil magistrates and mining commissioners were reappointed to the new divisions. A native commissioner was, as heretofore, appointed to each district, the whole being under the

control of the chief native commissioners at Salisbury and Bulawayo respectively. The system of land apportionment adopted in Mashonaland was followed in the new territory. "Stands" or plots were sold at extraordinary prices in Bulawayo; 539 fetched a total of £153,312, about £285 a stand. In within nine months Bulawayo had a population of 1900 whites, and in the various goldfields over 2000 prospectors. The construction of telegraphs proceeded with great rapidity, and by the end of 1895, 500 miles of new lines had been constructed, making about 1500 in all. A new company, the "African Transcontinental Company," had been founded under the auspices of Mr Rhodes, with the ultimate purpose of connecting the Cape with Cairo. By the end of 1895, 313 miles of these lines had been laid.

The events of 1896 brought a rude change on this smiling prospect. In that disastrous year occurred the Jameson Raid, the Mashona and Matabele revolt, and the outbreak of rinderpest, which killed nearly all the beasts of burden in the country. The rebellions were finally put down in the early part of 1897, but when the cost to the company of these misfortunes came to be reckoned up it was found to amount to at least £2,500,000 sterling. All this involved the company in a heavy debt, and in April 1898 it was resolved, at a general meeting of shareholders, to increase the capital by £1,500,000 sterling, only one-sixth of which was issued in shares at once. At the same meeting it was enthusiastically resolved to proceed again with the work of the company. In consequence of the events of 1896 the British Government imposed a new or supplemental charter on the company. This charter gave the Government a much stronger hold on the whole administration of the company than it possessed before. By this charter the power of the company to make ordinances was to pass to a legislative council to be established for Southern Rhodesia. Duly authorized agents of the secretary of state were to have access to all the company's documents. All resolutions passed by the directors regarding the administration were to be submitted to the secretary of state within eight days for his approval or rejection, and any neglect to comply with these conditions was to subject the company's servant guilty of the same to the possibility of instant dismissal. Still the opening of the railway to Bulawayo in November 1897 seemed to promise a new era of development, and it greatly reduced the cost of transport. The population began to increase rapidly, and by 1898 Bulawayo had more than 5000 inhabitants. The value of the public buildings was estimated at £140,000. There were 1664 miles of telegraphs and nearly 850 miles of roads brought into existence through the energy of the company. By the last balance-sheet issued by the company previous to the outbreak of the Boer war it would appear that the revenue of Rhodesia for the year ending 31st March 1898 amounted to £260,516 net, of which amount the sale of land plots accounts for £63,628; stamps and licenses, £69,658; and posts and telegraphs, £46,745, so that the machinery of civilized life was already in full activity where Lo-Bengula's kraal had stood in 1894. The Government buildings were estimated in March 1898 to be worth £165,672, and the assessed value of the town property at Bulawayo was £2,045,000, and that at Salisbury £750,000. Education was arranged under the supervision of Government inspectors, and various religious communities have now brought their own organizations to a high state of efficiency. In the years 1897-98, 2485 miles of road were being maintained by the company at a cost of £23,500. A police force of 1322 men maintained order in the two provinces, and the hut tax paid by the natives throughout the territory amounted to over £19,000. At this time the

relations between the natives and the company's servants appear to have been most satisfactory, an inference which is borne out by the peaceable attitude of the former during the Boer war. In 1896 it was found necessary to appoint a puisne judge to preside over the high court at Bulawayo. So far back as 1891 a system of municipal as distinguished from military police had been inaugurated, and, following the precedent of Cape Colony, sanitary boards were formed to regulate the municipal affairs of the several townships. At the public request, and in order that the ratepayers should enjoy a fuller measure of control, regulations for the constitution of municipalities were framed by the administration and promulgated in September 1897. Under the provisions thus enacted, the sanitary boards of Salisbury and Bulawayo gave place to duly constituted municipal councils, and the first mayors were elected for the two towns in that year.

On the 25th November 1898 the Southern Rhodesia Order in Council became law. Southern Rhodesia was divided into two provinces, Mashonaland and Matabeleland, with separate administrators. The order further provided for a high court of Southern Rhodesia and for the constitution of executive and legislative councils, and made other changes in the administrative organization.

North-Western Rhodesia is also known as Barotseland. The principal native chief is King Lewanika, and the representative of the company resides at his court. He is favourably disposed to white men. There is a force of thirty white police quartered in the Batoka plateau, besides a force of native police. This latter is necessary, for much of this country is almost uninhabitable by whites in the rainy season. A new mail service has been arranged. Runners leave Francistown weekly for Kazungula, returning with outgoing mails. The delimitation of the boundary is not yet completed between Barotseland and the Portuguese territory.

North-Eastern Rhodesia is divided into districts in charge of collectors and subdistricts in charge of assistant collectors. There are four districts, and through them run 700 or 800 miles of road constructed by the collectors. Defence is conducted under an arrangement with the British Central Africa Protectorate. The civil police number about 200. The revenue for the year ending 31st March 1899 amounted to £2275, 18s. 3d., of which about £1000 is claimed as owing from sales of ivory given as tribute, and about £565 came from postal charges. As there are no import or export duties except on ivory, no complete record of imports and exports is possible. The area of this province is estimated at 120,000 square miles, the whole of which (with the exception of a small portion of the valley of the Loangwa river) lies over 3000 feet above the sea.

By the beginning of 1899 the company appeared to be starting on a new career after the unfortunate reverses it had sustained in 1896, but a stop was put to all progress by the Boer war. The company can point with satisfaction to the fact that Rhodesia contributed nearly 1500 men to the forces serving in the war, or 12½ per cent. of the European population. Of these British South Africa police supplied 300; Mashonaland volunteers, 800; Mashonaland squadron, 150; independent volunteers estimated at 250. Rhodesia itself was not subjected to invasion, but the withdrawal of so large a number of able-bodied men seriously interfered with the progress of the country.

It must be remembered that the company possesses vast territories north of the Zambezi already in great part explored, and it is believed that the future will show them to be rich in mineral wealth and containing immense resources for agricultural and commercial development.

This country has been traversed by several travellers, among them Major St Hill Gibbons and Colonel Goold Adams. Traders, prospectors, and the company's officials pass through it, but generally leave no printed records. It is now divided into two provinces, North-Eastern and North-Western Rhodesia, each having its own administrator, and regulated by Orders in Council of 1899 and July 1900.

Railways.—The railway from Mafeking to Bulawayo, completed in 1897, shows a steady increase in revenue. The net earnings had risen from £11,877 in the year ending 31st October 1895 to £99,290 in the year ending 31st October 1898. The Mashonaland railway from Umtali to Salisbury, begun in October 1897, reached Salisbury on 1st May 1899. The share interests of these railways were amalgamated under the "Rhodesia Railways Trust," Limited, with a capital of £1,000,000. To sum up the work accomplished in this direction, the British South Africa Company first built the railway from Kimberley to Vryburg (a distance of 127 miles), which was soon afterwards purchased by the Cape Government. The company then continued the line to Bulawayo, a distance of 590 miles. It also obtained the capital and built the railway from Beira on the east coast through Portuguese territory to Umtali, a distance of 210 miles. This line was afterwards continued to Salisbury, a distance of 170 miles. The British South Africa Company has therefore built, or has caused to be built, 717 miles of railway from the south to Bulawayo, and 380 miles from Beira to Salisbury, giving a total of 1097 miles of completed railways. Contracts have been entered into for a further 300 miles of railway which will connect Bulawayo with Salisbury, and Bulawayo with Gwanda, 93 miles. This work is in active progress. A survey has also been made 250 miles northwards from Bulawayo through the Wankie coalfields to Victoria Falls.

Mines.—With regard to mines, numerous concessions to prospectors have been granted by the company, and some extensive finds of precious metal have been made. Extensive pegging has been done by prospectors under licenses issued by the company, and also by subsidiary companies and individuals who have acquired grants. The results of development operations here given and conducted, in spite of adverse conditions prevailing in

consequence of the war of 1893, the rinderpest, the native rising in 1896 and 1897, and later the Boer war, should be studied in order to gauge the probable future of Rhodesia as a gold-producing country. There are sixteen gold-mining companies actually milling, with a total crushing power of 269 stamps, while a further 240 stamps have been ordered by other companies whose properties are approaching the producing stage. Two mines have already erected cyanide plant for the treatment of tailings, and further plant has been ordered for ten other mines. The total output of gold from Rhodesia from the occupation of the country to the 31st August 1898 was 6532 oz.; from that date to the 31st December 1899 the output was 72,940 oz.; while for the year ended 31st December 1900 the Rhodesian output reached 85,534 oz., giving a total output to that date of 165,006 oz. In Northern Rhodesia valuable deposits of copper are being opened up, and in Southern Rhodesia coal of excellent quality has been proved to exist in enormous quantities in the Wankie district, a short distance south of the Victoria Falls.

Whatever the judgment of history may be as to the career of the company as a whole, it must be admitted that it has performed a great work as a civilizing agency, and that this has been done entirely at the expense of the shareholders without their coming upon the Government for a single shilling. At present the investors have reaped no pecuniary advantage from their enterprise, for, except in 1895-96, the expenses of administration have exceeded every year the income from revenue, as a glance at the following table will show:—

	Revenue.	Expenditure.
1892-93	£34,153	£91,189
1893-94	44,489	183,979 ¹
1894-95	118,883	153,607
1895-96	399,090	227,626
1896-97	122,542	2,512,529 ²
1897-98	253,179	1,122,334 ²
1898-99	275,609	1,049,635 ³

Capital.—The following are the complete statistics of the company's capital:—

Date of Meeting.	Authorized.	Issued.	Dis. Nos. of Shares.
Original issue	£1,000,000	£1,000,000	1/1,000,000
20.11.93, and 19.12.93, purchase of R. R. concession	2,000,000	1,000,000 (f.p.)	1,000,001
12.7.95	2,500,000	500,000 (3/ 10/-)	2,000,000
6.11.96	3,500,000	500,000 (2/-)	2,500,001
Nov. '96			3,000,000
Jan. '97		500,000 (2/-)	3,000,001
21.4.98	5,000,000		3,500,000
May '98		250,000 (2/-)	3,500,001
Jan. '99		625,000 (2/ 10/-)	3,750,000
			4,375,000

Leaving unissued £625,000, Nos. 4,375,001/5,000,000, at January 1901.

Debentures and debenture stock bearing 6 per cent. interest for £750,000 were paid off in February 1896, but in July 1896 there was an issue of £1,250,000 debentures, bearing interest at the rate of 5 per cent.

On the unissued balance of £625,000 the company gave the subscribers to £3,125,000 debentures of Rhodesia Railways, Limited, an option to exchange their debentures for these shares at £5 per share of £1 each, on or before the 15th May 1901, or, as an alternative, an option, on or before that date, to apply for an allotment of an equivalent number of shares at £5 per share of £1 each, paying cash, and retaining their debentures. As has been pointed out before, this expenditure does not include the cost of the Jameson Raid (which was not borne by the company), and the expenses of suppressing the native rebellions in 1896-97, which came in all to £2,266,976.

Into the general question of the value of such acquisitions of territory as have been made by the British South Africa Company it is not our function to inquire here, but the history of this corporation demonstrates very forcibly the

dangers and advantages of development by chartered companies. Lack of control over its officers, and irritation excited among other nationalities, have led undoubtedly to serious complications; on the other hand, its administration is now under strict supervision by Government, and the territories occupied by the company could hardly have been British unless through the agency of a chartered company. Had not the territory of Rhodesia been in British hands in 1889, Germany, the Transvaal, and possibly Portugal would almost certainly have asserted claims. The action of Government is slow, and is hampered by public opinion, which it takes time to inform fully in such matters. Even had the British Government occupied the territory, it is more than doubtful if ten years could have seen the development which has taken place under the administration of the chartered company. No one can doubt that the native population is infinitely better off under the company's administration than in the days of raid and massacre under Lo-Bengula.

THE ROYAL NIGER COMPANY.

The charter of the Royal Niger Company was granted on 10th July 1886, but its real origin was earlier. Since

Origin and sphere of action. trade began between Europeans and the native races inhabiting the coast round the mouths of the Niger and its hinterland, it had been practically monopolized by the British. The Niger

itself had been discovered by British travellers. Mungo Park traced its course from its source to Bussa, and from Bussa to the sea. It was a Scotsman, Laird, who first organized, in 1822, the navigation from the sea to a point above the confluence of the river with the Benue. Within the next twenty-five years expeditions were despatched into the interior, and a consul was posted at Lokoja; but the deadly climate discouraged Government efforts, and the consulate was abandoned in 1866. Thus no effective attempt was made to connect these rich regions of the interior with British possessions on the coast. With regard to the delta of the river there is much the same story to tell. By the end of the 18th century British enterprise had almost entirely displaced the Portuguese, who had traded principally in slaves. The coast-line of the Niger delta may be said roughly to extend from Lagos to the mouth of the river Kwo-ibo, 200 miles eastward. The various streams into which the great river is divided at its mouth became known as the "Oil Rivers," from the palm oil which formed the staple article of commerce after the suppression of the slave trade. By the fourth decade of the 19th century British interests had grown so important that a permanent consulate was established, but up to the year 1880 no event of political importance calls for comment. From that year onwards constant pressure exerted by the United Africa Company, hereafter mentioned, on the Foreign Office and the Board of Trade caused the Government to contemplate taking over all the coast from Lagos to the Gaboon. Owing to complications elsewhere, however, this was not done, and Germany seized a portion of Cameroon. Then the British flag was planted in other parts of that district, but eventually the last patch of British territory in Cameroon was surrendered to Germany in 1887. Afterwards by agreement with Germany the eastern boundary of the Oil Rivers Protectorate was extended to the upper waters of the Benue and the shores of Lake Chad. Thus the entrance to the Niger territory passed into British hands.

It was in the development of the hinterland and the delta above mentioned that the Niger Company played so important a part. The French Government had been beforehand with the British in that district. Before 1880 two French companies, actively encouraged by Gambetta,

had set up trading stations along the Lower Niger, and the administration of Senegal had stretched out its arms towards the upper waters of the river. There was every likelihood of British trade being throttled. At this juncture Mr George Goldie-Taubman, previously an officer in the Royal Engineers, went to the Niger in 1877 for the purpose of crossing the continent to the waters of the Upper Nile. He then conceived the idea of creating a British province there, and in 1879 formed all the petty British firms trading on the main Niger into the United Africa Company. In 1881 he applied to Government for a charter, having found that the company could not exercise jurisdiction over foreigners without it. The capital of the company (£100,000) being too small for it to be entrusted with sovereign rights, he formed in 1882 the National Africa Company, with a capital of £1,000,000 subscribed. Even then the charter could not be issued until the two existing large French companies had been got rid of. These were bought out, and anticipating the Germans, Mr Goldie-Taubman (better known as Sir George Taubman Goldie) secured himself in the south by concluding treaties with the sultans of Sokoto and Gando. By the time of the Berlin Conference (1884) Great Britain could show that she alone possessed subjects with trading firms on the river. Her claim to a protectorate was admitted, and the company (now known as the Royal Niger) received its charter. It was anticipated that the new chartered company would extend the sphere of its operations, for provision was made in the first article for its authority over future acquisitions, and its political powers were defined. Any attempt on the part of the company to acquire a commercial monopoly in the regions under its sway was distinctly forbidden, and taxation could only be imposed sufficient to cover the actual expenses of the government.

The territories hereby put under the company's control did not include those on the coast which were directly under the British Government and known as the Niger Coast Protectorate. The interior, however, lay open to it, but here it was exposed to keen competition from foreign rivals. Its treaties also covered about half of the coast-line between Lagos and Cameroon, as well as all the delta behind that half of the coast-line. The greater part of the Niger delta was thus secured and saved by the company, as well as the two great entrances to that river, the Forcados branch and the Nun branch. On the south-east lay German Cameroon. The frontier had been settled by a convention in 1886, which was confirmed by another made in November 1893. The line was drawn from Rio del Rey to the rapids of Cross river, thence through Yola to the southern bank of Lake Chad. On the north and west the frontier coterminous with French territory was not yet settled; and this uncertainty led ultimately to dangerous complications, which were finally settled in June 1898. The territories over which the company exercised its sway were more than 500,000 square miles in extent, and contained from 20,000,000 to 40,000,000 of inhabitants. Their lower portion was occupied principally by small tribes in the most abject stage of barbarism, but above the lower Niger a very different country lay open to its enterprise. The Central (British) Sudan is one of the richest and most populous districts in Africa. Cereals, fruits, cotton, and indiarubber are among its products, and it possesses many large and thriving towns, some with as many as 100,000 inhabitants, and all capable of becoming centres for trade and commerce. Haussaland is the home of a stalwart race, many members of which have embraced Mahomedanism, and from them comes the finest material for the native soldiery. The company brought the greatest activity to bear upon

this promising region, and within a few years had extended its operations in all directions, concluding more than 400 treaties with various native chiefs. In 1888 the company was authorized to issue a loan of £250,000. This sum represented the amount that had been expended in the acquisition and maintenance of concessions. The interest was to be paid by means of taxation, gathered from customs duties which might be levied up to the amount of £12,500 a year. It is to be observed that for the payment of this interest the company as a trading concern was to be in no way responsible. The company was, in fact, twofold in its nature. It was, on the one hand, a political and governing body, on the other a purely commercial corporation. Within its own territory it acted as a simple trader, competing with others, and did not include State revenues among its assets. As a trading concern it has paid since 1882 an average dividend of 6 to 6½ per cent. on a paid-up capital of £493,680 and a subscribed capital of £1,027,080.

The organization of the company as a political body prospered rapidly after it had received its charter. The executive powers in Africa were entrusted to an agent-general, three provincial and twelve district superintendents. A chief-justice directed the judicial staff, and a commandant the troops. The entire direction was in the hands of a court sitting in London, with whom all the above officials communicated direct. This was called the "governing council." The first president or governor was Lord Aberdare, who was succeeded by Sir George Taubman Goldie, the founder of the company, and who was its "political administrator" during the whole period of its charter. The territory of the company was divided into districts, over each of which was placed a European governor, only a few commercial stations being in the hands of blacks. In 1891 the whole number of agents conducting the company's affairs in Africa only reached the number of 71. There was a judiciary at work in the territories of the company. The chief-justice had his residence at Asaba. The company had a fleet of about 30 steamers, two of which were protected by armour-plating and guns, and capable of carrying 300 or 400 men each. The army of the company consisted of about 1000 men, mostly drawn from the Haussas and under the command of British officers. Dues to defray the cost of administration were imposed on gunpowder, salt, alcohol, and tobacco, and there were also taxes on many articles of export.

Not long after coming into existence the company concluded a treaty with the sultan of Sokoto, by which, in return for the payment to him of a pension of £1500 a year, it enjoyed sovereign rights over the greater part of his states. This treaty was followed by others concluded with other chiefs, until rights had been obtained over nearly the whole of Haussaland. Disputes arose with

History and development. France regarding the possession of the sultanate of Borgu, especially the important ports of Nikki and Boussa. At times these seemed to threaten the peace of the world, but fortunately they were amicably arranged in 1898. The progress of the company naturally involved some military operations, for collisions with the natives occasionally took place, especially with the slave-traders. The most important expedition was that of 1897, undertaken against the sultans of Nupe and Ilorin, whose power had become extremely menacing. A force was despatched under the command of Sir George Taubman Goldie himself. The principal object in view was to destroy once for all the extensive slave trade which found its chief centre and support in the dominions of these potentates. The expedition consisted of native troops (500 Haussas) under

30 white officers with machine guns. In January 1897 the force left Lokoja, and in three weeks had decisively defeated the sultan of Nupe and 20,000 men; he was deprived of most of his dominions, and a sovereign was set up in his stead who was a vassal of the company. From Bida the company's forces marched upon Ilorin, the sultan of which was defeated, and the whole district then submitted to the company's authority. On 22nd June 1897 the legal status of slavery within the company's territory was abolished by statute. Long before this the importation of alcohol had been forbidden north of the 7th degree of north latitude. By this provision the consumption of spirits was reduced to one-quarter of the amount to which it had previously attained. Charges were frequently made against the company of unjust and excessive taxation, overstepping the limits allowed by the charter. These were formulated in the most comprehensive manner by Herr von Puttkamer, who was sent to the Niger as the Imperial German commissioner, and the same accusations were made by British and French traders. An independent commission, however, was despatched by the British Government under Sir Claude Macdonald, which exonerated the company from all charges of violating its charter and spoke in terms of high praise of the work it had effected.

After the settlement with France in 1898 it was impossible that the company could long continue to hold sway over half a million square miles of territory in the immediate neighbourhood of the possessions of great Powers, which often refused to recognize the acquisitions made by so ambiguous a competitor. The resources of the company also no longer sufficed for the work of administration and police required by so vast a dominion. Its leading minds had always foreseen the ultimate probability of the State stepping forward to acquire their rights of sovereignty. There was no disposition, therefore, to resist the inevitable, the only question being the amount which was to be accepted as an adequate compensation for the surrender of these rights. The Act which enabled the British Government to purchase the company's rights under the charter became law in August 1899, and in January 1900 it took over the company's territories. The terms did not, perhaps, err on the side of generosity, but they were as high as any Government could venture to propose to the House of Commons. No allowance was made to the shareholders as compensation for the risks which they had undergone before their venture became a pronounced success, but, in return for the surrender of the charter and the transfer of all the political rights which the company had acquired by "treaties, conquest, or other lawful means," the Government was to repay the amount of £300,000 which the company had advanced out of its private trading profits to cover the costs of administration. The company was to receive the further sum of £150,000 for the surrender of their private land and mining rights, and it was also to be entitled to one-half of any royalties which the Government of Nigeria might receive during the next 99 years in respect of minerals exported from such portions of the territory as were bounded on the west by the main stream of the Niger, and on the east by a line running direct from Yola towards Zinder, provided that such minerals were exported from a British port or passed through a British custom house. The barracks, stores, wharves, steamers, &c., which were purchased from the company were surrendered at a price fixed by agreement at £115,000. The Imperial Government, of course, assumed the payment of the interest (£12,500 per annum) on the loan mentioned above which the company had been authorized to raise for the purpose of administration. On these terms

the transfer to the Government was completed, and though the company still continues its existence as a trading concern, it has ceased to have any connexion with the administration of Nigeria.

It now remains to sum up the results accomplished by the Niger Company during the fourteen years of its existence. Before the company got to work the settlements on the Oil Rivers might at any time have had their markets in the interior closed to them. There was no

Results. administration even at the Oil Rivers until 1891. To the energetic action of the company the colony of Lagos owes its mainland sphere, for it had saved the hinterland of these coast districts from falling into the hands of France and Germany. Indeed, it was only by a margin of a few months that the eastern portion of Nigeria was snatched from the encroachments of the latter Power. It may be doubted whether the British Government itself could ever have accomplished the task, since little interest at the time was felt in the Niger territories, which were looked upon rather as an unhealthy locality of which little was to be made. Among the greatest obstructives were the private traders, who always opposed annexation on the ground of increased taxation, but whose eyes were opened to a certain extent by the seizure of Cameroon by Germany. Five years of struggle with that Power ended in 1890 in the Anglo-German agreement, which recognized British rights which had been acquired by the company against the strenuous opposition of Flegel, Hoenigsberg, and other explorers backed up by Prince Bismarck. Nor was Germany the only Power with which the company had to reckon. It constantly opposed the increase of French influence. Since 1879 that Power had adopted an aggressive colonial policy in those regions. The plan was very simple, and was succinctly described by Sir George Taubman Goldie as "pushing inland from her coastal possessions, and then adopting lateral extensions and occupying the land in the rear of the coastal possessions of her neighbours, cutting them off from their markets in the interior." France had pursued this policy successfully in the case of Gambia. Though Great Britain had been established for seventy years on the coast, France annexed the rich districts on the Upper Niger now known as French Sudan, and thus spoiled the markets for Gambia. The same policy was partially successful with regard to the Gold Coast and Sierra Leone colonies, but the progress of the Niger Company aroused public attention in Great Britain, and the further progress of this design was frustrated. By buying up the rival companies before the Berlin Conference of 1884, the company secured recognition of the supremacy of the British flag on the Niger, and later by its enterprise enabled the British Government to insure a satisfactory settlement of claims in the regions of the Upper Niger and the possession of the vast dominions of the Sokoto sultanate.

Apart from political considerations, the work effected by the company for civilization must not be ignored. The absolute prohibition of the trade in alcohol in certain districts, and the severe blow dealt to the slave trade by the campaign of 1897, entitle it to the respect and gratitude of humanity. In ten years the company established in a barbarous region an organized system of justice and police supported by an adequate military force, placed on the waterways a fleet of 30 steamboats, founded a number of trading stations, and set on foot a regular scheme of cultivation in certain districts, besides conducting a large and lucrative commerce. All this was done without costing Great Britain a penny, while the neighbouring settlements of France and Germany were not only mulcting these countries of vast sums, but bringing in no return.

At the close of the company's existence as a governing body, when the administration of its territories definitely passed from its hands into those of the imperial authorities, a consideration of the following figures will supply some data for estimating the progress made under its administration and also as a trading concern:—

The Niger Trading Company.—The first balance-sheet was issued in July 1888, and carries the transactions of the company to 31st December 1887.

The trading account for 1887 amounted to	£46,765	10	5
leaving a balance to profit of	26,005	11	5
The total assets of the company amounted to	470,317	6	8
With slight fluctuations the profits gradually rose, and in December 1898 there was a balance to profit of	36,396	9	6
In that year the total assets of the company were valued at	700,035	6	0

To show the increase in the volume of commodities dealt with, it is interesting to compare the inventory of goods, stores, produce, &c., in Africa in December 1887 and December 1898.

In 1887 the stock of goods, stores, &c., in Africa was valued at	£158,023	18	8
Goods awaiting shipment	723	18	7
Produce in England and afloat	30,799	13	10
Total	£189,547	11	1

In 1898 stock of goods, &c., in Africa	£247,961	2	9
Goods awaiting shipment	2,237	19	5
Produce in England and afloat	89,717	2	0
Total	£339,916	4	2

Niger Government.—If we now consider the company in its administrative capacity for the same period, the statistics are no less instructive.

In 1887 the company's revenue stood at	£42,396	0	0
And its expenditure at	71,324	0	0
The revenue from imports amounted to	24,037	0	0
" " exports to	16,781	0	0
" " licenses to	1,280	0	0
In that year the expenditure on the constabulary force amounted to	13,395	0	0
And the salaries of the staff in Africa to	10,269	0	0
At the end of 1898 the revenue amounted to a total of	113,305	0	0
And the expenditure to	135,093	0	0
The revenue from imports now amounted to	63,054	0	0
" " exports to	48,981	0	0
" " licenses to	480	0	0

The expenses of administration and revenue were thus showing a tendency to balance themselves at the time the company's territory was taken over.

Private Traders.—One point is worth noting in considering these balance-sheets, as bearing out what has been said above as to the capacity of great trading companies to kill private competition within their own districts, even without any unfair advantages.

In 1887 the revenue from the imports of private traders amounted to	£998	0	0
From the exports to	1335	0	0
And licenses to private traders to	660	0	0
In 1898 the revenue from private imports amounted only to	260	0	0
While that from exports and licenses was			<i>nil.</i>

THE IMPERIAL BRITISH EAST AFRICA COMPANY.

This company came into existence in 1888, but its origin may be traced 10 years earlier. In 1877 the sultan of Zanzibar had offered to Mr (afterwards Sir) William Mackinnon, or to a company to be formed by him, a lease for 70 years of the customs and administration of the whole of the Zanzibar dominions, including all rights of sovereignty, with certain reservations. This was declined owing to a lack of support by the Foreign Office. Between 1880 and 1885, however, the large number of German concessions acquired aroused the interest of those who recognized the paramount importance of the maintenance of the British influence in those regions, and in May 1887 a concession bearing that date was voluntarily made by

Origin and early difficulties.

the sultan and accepted by the association which had now been formed by Mr Mackinnon. This association became the Imperial British East Africa Company by a founder's agreement of April 1888, having received a royal charter in September of the same year. To this company the sultan made a further concession dated October 1888, to be read with the previous concession. On the faith of these concessions and the charters an amount of £240,000 was subscribed, and the company received formal charge of their concessions. The rights of which they believed that they were to assume possession were "all the powers and authority to which the sultan was entitled on the mainland in the Mrima, and all his territories and dependencies from Wanga to Kipini inclusive, also the islands embraced in such territory," saving, of course, all obligations already incurred by that potentate with Great Britain or other Power. The first difficulties which the company had to encounter arose out of the aggressions of the German East Africa Company, supported by the German Government. This company also received a grant from the sultan in October 1888, and its appearance on the coast was followed by grave disturbances among the native tribes which had welcomed the British. This outbreak led to a joint British and German blockade, which seriously hampered trade operations. It had also been anticipated, in reliance on certain assurances of Prince Bismarck, emphasized by Lord Salisbury, that German enterprise in the interior of the country would be confined to the south of Victoria Nyanza. Unfortunately this expectation was not realized. It was necessary that the British company should enjoy the command of all the ports from which it was to draw its customs revenue, but from the first disputes arose between them and German subjects who formulated claims over certain portions of the same districts. A German claim was put forward to the petty sultanate of Witu, where there were some German plantations subsequently bought up, and the German Government endeavoured unsuccessfully to obtain a concession of the island of Lamu, which contains the principal town on the coast north of Mombasa. These claims were submitted for arbitration to Baron de Lambert, the Belgian secretary of state, who decided against the German contention. German intrigues did not thereby come to an end, and native resistance to the company's authority was fomented. Similar difficulties arose over the possession and administration of Manda and Pata, and of the port of Wanga, though in those cases the German claims had even slighter foundation than at Witu. In all these disputes the German Government countenanced its own subjects, while the British Foreign Office did little or nothing to assist the company, sometimes directly discouraging its activity. The great importance to the trading operations of the company involved in the peaceable possession of these places may be gathered from a brief study of the terms on which the company's right to exact revenue in its territories had been granted by the sultan. The basis of this arrangement is to be found in article 9 of the concession of 9th October 1888.

The company guaranteed to the sultan the whole amount of the customs duty he received at the time the concession was entered into, the annual average payable being fixed according to the original understanding by the experience of the first year, but, at the time this agreement was actually entered into, the Germans were pressing for a grant of Lamu, and the British company had to accept the sultan's interpretation of these financial clauses. It was therefore agreed that (1) the annual revenue was to be based, not on an average, but on the actual results of the first year; (2) the payment to the sultan was to be determined by the amount of the gross revenue without

allowing for expenses of collection. These concessions seemed worth making from a business point of view, as it might reasonably be supposed that they would largely increase their customs duties under the company no less than from an imperial point of view, for they confirmed the sultan in loyalty to British interests, and these would have virtually vanished in East Africa had he transferred Lamu and the northern stations to Germany. The importance attached by the company to the possession of these places may be gauged, therefore, by the sacrifices they were prepared to make to retain them. Unfortunately, by a curious combination of circumstances, the first year's revenue was unusually large; the German ports were closed and some of their trade came to the British ports, and a sudden impulse was given to trade by the appearance of the British company. All this was ultimately much to its disadvantage.

The next serious difficulty encountered by the company arose from what was known as "the race for Uganda." By the hinterland doctrine, accepted both *Uganda* by Great Britain and Germany in the diplomatic correspondence of July 1887, there was no doubt that Uganda would be taken to fall within Great Britain's "sphere of influence," but German public opinion evidently did not so regard the matter. The maps published in that country assigned the territory to Germany, and in England public opinion as strongly expected British influence to be paramount. However, in 1889 Dr Peters led what was practically a raiding expedition into that country after running a blockade of the ports. The British Government made no attempt to put a stop to this beyond a formal protest to the German Government, which expressed its determination not to countenance Peters. They were not, however, pressed to stop his advance by force, and he managed to make his way into the back of the company's territory. Early in 1890 Emin Pasha made an arrangement with the German Government to lead an expedition in the direction of Uganda. As the British Government did not feel inclined to undertake the protection of British interests in Uganda, the company had to protect itself. In March 1890 it despatched an expedition thither under Captain Lugard. An expedition under Mr Jackson, which had left the year previously, with instructions to avoid Uganda, had been diverted there on receipt of the news regarding Peters and Emin Pasha. Peters retired at Jackson's approach, claiming, however, to have made certain treaties which constituted "effective occupation," and Emin threatened to complete Peters's work. The dispute came to an end by the Anglo-German agreement of 1890. Uganda was assigned to the British sphere of influence. The country was in a dangerous state of ferment; Roman Catholic and Protestant converts were arrayed against each other, and the French missionaries unfortunately fomented the ill-feeling. By the middle of 1890, however, Captain Lugard had established peace and the authority of the company had become supreme. In July 1890 representatives of the Powers assembled at Brussels and agreed on common efforts for the suppression of the slave trade. The interference of the company in Uganda had been a material step towards that object, but no really satisfactory occupation could be brought about except by the construction of a railway, and this the company's resources did not allow them to undertake. Though the British prime minister paid the highest tribute to their labours, and a preliminary grant for the survey had been practically agreed upon, the scheme was wrecked in Parliament. The company had imported some 50 miles of light, narrow-gauge rails, which were actually laid for a distance of 14 miles. Locomotives were tried, but the line was too

light for safety, and serious accidents happened. The line in the island of Mombasa is still worked by human labour. Finally, the company decided to withdraw Captain Lugard and his forces in August 1891; the occupation was, however, prolonged to 31st March 1893, on the promise of the Government to bear the expense.

The company found itself involved in further difficulties through having to undertake the administration of the coast towns. With it took over with great reluctance, as it did not regard it as part of the contract under the charter, though the Government held the opposite view. Kismayu, however, was a port of little importance to Great Britain, for it is a poor harbour, difficult of approach, and much exposed to the south-west monsoon. The trade is small, for there is no trade route there to the interior. To facilitate trade the company had adopted the policy of subsidizing the Somali tribes in the hinterland, and the Government agents took exception to this method of proceeding. The pecuniary interests of the company further sustained a severe blow owing to the action of the British Government in Zanzibar, which had been taken under the protectorate of Great Britain in October 1891, by the agreement with Germany made in 1890, though its administration remained in the hands of the Zanzibar Government.¹ In June 1892 the British Government declared the dominions of the sultan of Zanzibar, including the mainland territory under the company's rule, to be within the free zone. This act extinguished the treaties regulating all tariffs and duties with foreign Powers, and gave free trade all along the line. This was plainly a violation of the rights of the company under its original agreement with the sultan. The answer of the British Foreign Office to the company's protest was that there was only a "delegation" of the sultan's powers, which he had a right to withdraw when he liked; yet the company was still held liable to pay the compensation for the customs dues which it had originally undertaken to pay. The result for the company was that dues were now swept away without compensation, and the company was left saddled with the payment of the rent, and with the cost of administration in addition, though administration had been the inevitable corollary of taking the dues over. In June 1894 the sultan signified his willingness to negotiate with the company for its withdrawal from the contract.

A final difficulty between the company and the British Government remains to be noted. At the invitation of the Foreign Office the company had instituted efficient tribunals and secured consular powers in the coast towns for the benefit of British subjects, and had been invited to prepare a scheme of taxation which might be offered for the approval of the Government. Such a scheme was duly drawn up and submitted, but never approved, and ultimately the Foreign Office took up the position that, in instituting a system of administration, the company had been merely fulfilling its obligations to the untaxed population (principally British-Indian), and that the whole question must be considered apart from that of taxation and jurisdiction over foreigners. With regard to British subjects residing beyond the concession limits the difficulties were very great. The company found itself responsible for the maintenance of order, yet was not permitted to arrest offenders who were British subjects and bring them to the coast for trial.

¹ In giving his assent to the Berlin Act the sultan had (on the advice of H.M. Government) reserved his fiscal rights against the operation of the free trade provisions of that Act. Subsequently the reservation was overruled, and without any *quid pro quo* his highness's dominions were included in the free-zone system.

In every direction the company's affairs had drifted into an *impasse*. In addition to the causes already indicated, this may be attributed to insufficient capital, want of funds, and small revenue. Plantations had been taken over on the coast and worked at a loss, money had been advanced to native traders and lost, and expectations of trade had been disappointed. At a meeting of shareholders on 8th May 1894 an offer to surrender the charter to the Government was approved, though not without strong protests. Negotiations dragged on for over two years, and ultimately the terms of settlement were that the Government should purchase the property, rights, and assets of the company in East Africa for £250,000. Uganda had been made a protectorate before the extinction of the company, on the Portal report being received by the Foreign Office.

Altogether, considering the slow development which this region has since shown, the commercial prospects of the company, and the cost to it of administration, it cannot be said that the price paid at the time by the British Government was so insufficient as it appears at first sight. Sir William Mackinnon, through whose judgment, foresight, and patriotism British influence had become predominant in East Africa, had died in June 1893. He was fated to see the company by no means a success commercially, yet it had accomplished a solid work in advancing the civilization of the dark continent. In exploring and development it could point to several successful expeditions: to the founding of the Scottish Industrial Mission at Kibwezi (which is now extinct), about 200 miles from the coast on the way to Uganda, and its connexion with the sea by a track known as the "Mackinnon road"; and to the establishment of telegraphic and telephonic communication between Mombasa and Lamu. It had set up a system of administration which had helped to create confidence and stimulate trade. In 1893 the cost of transport for a ton of merchandise between Mombasa and Uganda had been as much as £300. It had made pioneer experiments in transport, the results of which were reaped by later traders; its official reports afforded valuable information about the tribes of the interior, and under its administration more than 3000 slaves had been freed, though this is a small number compared with those saved in stopping the trade itself. The drink traffic, too, had been prohibited. On the successful termination of the Sudan war in 1898, the importance of its work in establishing British influence in the region of Victoria Nyanza became clear.

When the company's affairs were finally wound up in March 1897, it was found that in acquiring, developing, and administering the territories ultimately taken over by H.M. Government there was a total deficit of £193,757, 7s. 8d., which was made up as follows:—

(1) Outlay within the sultan of Zanzibar's 10-miles limit under deduction of all revenues	£139,404 14 1
(2) Outlay in the interior, including Uganda and Witu, under deduction of grants by Sir W. Mackinnon and friends of Church Missionary Society (£26,633, 18s. 6d.)	122,542 2 6
(3) Costs of all assets handed over to H.M. Government	145,780 12 4
(4) Home charges, including costs of charter less amount recovered on forfeited shares (£2825)	36,029 18 9
	Total £443,757 7 8
Payment from H.M. Government	250,000 0 0
	Total deficit £193,757 7 8

At the time of the company's liquidation the accounts showed a total revenue during the whole period of its existence of £171,469, 0s. 1d.

This was principally made up of:—

Gross customs collections	£89,067 3 10
Revenue from various sources, departmental and otherwise	51,373 15 4

The amount expended on the survey and construction of railways, tramways, &c., was more than £67,000.

THE BRITISH NORTH BORNEO COMPANY.

The occupation of the island of Labuan by the British Government in 1847 is the starting-point from which to trace the connexion of Great Britain with North Borneo. In 1872 the Labuan Trading Company was established in Sandakan, and in 1878, through the instrumentality of Mr Dent, the sultan of Sulu transferred all his rights in North Borneo to a syndicate, the chief promoters of which were Sir Rutherford Alcock, Admiral the Hon. Sir Henry Keppel, and Mr R. B. Martin. Early in 1881 the British North Borneo Provisional Association, Limited, was formed to take over the cession with all rights and properties. A petition was addressed to Queen Victoria for a royal charter in November 1881, and the British North Borneo Company, which was formed in May 1882, took over, in spite of some diplomatic protests on the part of the Dutch and Spanish Governments, all the rights, territorial and sovereign, in the original grants, and proceeded under the charter to organize the administration and development of the territory in question. The company has since acquired further territories: the Putatan river in May 1884, the Padas district in November 1884 (including two important rivers, the Padas and the Kalias), the Kawang river in February 1885, and the Mantanani islands in April 1885. In 1888 H.M. Government declared the whole territory to be under the protection of Great Britain, and thenceforth it was officially known as "The State of North Borneo." In 1890 the British Government placed the island of Labuan under the administration of the company. In March 1898, after the suppression of the Mat Salleh rebellion, arrangements were made whereby the sultan of Brunei transferred to the company all the sovereign and other rights over the districts north of the Padas river which had previously been in his possession. This cession was of the highest importance, for it meant that a large number of enclaves, which had formerly been resorts for disaffected natives, and therefore a continual source of annoyance, passed under the control of the company, which was also enabled to consolidate its somewhat scattered possessions into a compact territory. (See also BORNEO.)

Administration.—There are now ten Government stations on the coast administered by Europeans, and five inland, the most important being at Sandakan, Darvel Bay, and Gaya Bay. The entire population of the company's territory is estimated at 200,000, including some 20,000 Chinese, and about 150,000 of the population are distributed throughout the west coast. The population of Sandakan, the capital, is estimated at from 6000 to 7000.

The form of government adopted by the company is practically that of a British colony. It is vested in a court of directors, appointed under royal charter, administered by a resident governor with the assistance of a colonial secretary. Under them are three residents of districts, several assistant residents, and departments of the Government service, such as treasury, land and survey, public works, harbour, medical, judicial, and constabulary. At the head of the judiciary is the governor, who is the chief judicial officer of the supreme court and court of appeal. The residents are the senior judges and judges of the courts of appeal. There are also district magistrates and justices of the peace. The Indian penal code and the Indian Civil Procedure and Evidence Acts have been adopted almost as they stand, but the rights and customs of the natives receive special recognition, and the land regulations are so framed as to encourage immigrants. The higher officers of the Government form the legislative council. The native chiefs and headmen are responsible to the Government for the preservation of order in their own districts, a trust which they discharge on the whole remarkably

well. The Government police number about 500; the majority of these are Sikhs, with some Pathans and Dyaks.

Revenue.—The principal sources of revenue are the following: license for purchasing and retailing opium, spirits, &c., all of which are in the hands of private persons. Five to ten per cent. duty is placed on imports, and the same amount of royalty on jungle produce exported. The old source of revenue among the natives was a poll-tax, and this has been retained in lieu of land taxes; there is also a stamp duty. Proceeds of sales of Government land, quit-rents, and fees on transfers, make up the land revenue. Judicial fees and post and revenue stamps make up the sources of revenue.

When the company obtained its charter the northern portion of the island was in a state of chaos, the interior was divided up among a number of small chieftains whose authority was hardly recognized, and the coasts were devastated by pirates. All this has been changed, and at a rate of taxation which barely reaches one shilling and threepence per head of the inhabitants, as compared with five to twelve shillings in India, or six to sixteen shillings in Java. From an imperial point of view the change is no less remarkable. In 1881 the influence of Great Britain went for nothing. To-day she is mistress of the best part of the island, and her commerce is predominant.

Wood Renton, London, 1897. (W. B. DU.)

Charters Towers, a municipality and mining town, Queensland, Australia, in the county of Devonport, 82 miles S.W. from Townsville, with which it is connected by rail. It is in the centre of an important gold-field, the output of which was valued, in 1899, at £1,216,750. Abundant water supply is obtained from the Burdekin river, about 8 miles distant. Altitude about 1000 feet. Population, 4597.

Charts.—A chart is a marine map intended specially for the use of seamen. It is constructed for the purpose of ascertaining the position of a ship with reference to the land, of finding the direction in which she has to steer, the distance to sail or steam, and the hidden dangers to avoid. The surface of the sea on charts is studded with numerous small figures. These are known as the *soundings*, indicating in fathoms or in feet (as shown upon the title of the chart), at low water of ordinary spring tides, the least depth of water through which the ship may be sailing. Charts show the nature of the unseen bottom of the sea—with the irregularities in its character in the shape of hidden rocks or sand-banks, and give information of the greatest importance to the mariner. No matter how well the land may be surveyed or finely delineated, unless the soundings are shown a chart is of little use.

The early charts were plane charts, drawn on the principle of the earth being an extended plane. This construction is suitable for harbours, coastal sheets, limited districts, such as the English Channel, or for coasts within the tropics, but becomes incorrect and even dangerous if used on voyages extending over the oceans. To remedy this defect, in 1569 Gerard Mercator, a Fleming, conceived

light for safety, and serious accidents happened. The line in the island of Mombasa is still worked by human labour. Finally, the company decided to withdraw Captain Lugard and his forces in August 1891; the occupation was, however, prolonged to 31st March 1893, on the promise of the Government to bear the expense.

The company found itself involved in further difficulties through having to undertake the administration of the coast towns. Witu it took over with great reluctance, as it did not regard it as part of the contract under the charter, though the Government held the opposite view. Kismayu, however, was a port of little importance to Great Britain, for it is a poor harbour, difficult of approach, and much exposed to the south-west monsoon. The trade is small, for there is no trade route there to the interior. To facilitate trade the company had adopted the policy of subsidizing the Somali tribes in the hinterland, and the Government agents took exception to this method of proceeding. The pecuniary interests of the company further sustained a severe blow owing to the action of the British Government in Zanzibar, which had been taken under the protectorate of Great Britain in October 1891, by the agreement with Germany made in 1890, though its administration remained in the hands of the Zanzibar Government.¹ In June 1892 the British Government declared the dominions of the sultan of Zanzibar, including the mainland territory under the company's rule, to be within the free zone. This act extinguished the treaties regulating all tariffs and duties with foreign Powers, and gave free trade all along the line. This was plainly a violation of the rights of the company under its original agreement with the sultan. The answer of the British Foreign Office to the company's protest was that there was only a "delegation" of the sultan's powers, which he had a right to withdraw when he liked; yet the company was still held liable to pay the compensation for the customs dues which it had originally undertaken to pay. The result for the company was that dues were now swept away without compensation, and the company was left saddled with the payment of the rent, and with the cost of administration in addition, though administration had been the inevitable corollary of taking the dues over. In June 1894 the sultan signified his willingness to negotiate with the company for its withdrawal from the contract.

A final difficulty between the company and the British Government remains to be noted. At the invitation of the Foreign Office the company had instituted efficient tribunals and secured consular powers in the coast towns for the benefit of British subjects, and had been invited to prepare a scheme of taxation which might be offered for the approval of the Government. Such a scheme was duly drawn up and submitted, but never approved, and ultimately the Foreign Office took up the position that, in instituting a system of administration, the company had been merely fulfilling its obligations to the untaxed population (principally British-Indian), and that the whole question must be considered apart from that of taxation and jurisdiction over foreigners. With regard to British subjects residing beyond the concession limits the difficulties were very great. The company found itself responsible for the maintenance of order, yet was not permitted to arrest offenders who were British subjects and bring them to the coast for trial.

¹ In giving his assent to the Berlin Act the sultan had (on the advice of H.M. Government) reserved his fiscal rights against the operation of the free trade provisions of that Act. Subsequently the reservation was overruled, and without any *quid pro quo* his highness's dominions were included in the free-zone system.

In every direction the company's affairs had drifted into an *impasse*. In addition to the causes already indicated, this may be attributed to insufficient capital, want of funds, and small revenue. Plantations had been taken over on the coast and worked at a loss, money had been advanced to native traders and lost, and expectations of trade had been disappointed. At a meeting of shareholders on 8th May 1894 an offer to surrender the charter to the Government was approved, though not without strong protests. Negotiations dragged on for over two years, and ultimately the terms of settlement were that the Government should purchase the property, rights, and assets of the company in East Africa for £250,000. Uganda had been made a protectorate before the extinction of the company, on the Portal report being received by the Foreign Office.

Altogether, considering the slow development which this region has since shown, the commercial prospects of the company, and the cost to it of administration, it cannot be said that the price paid at the time by the British Government was so insufficient as it appears at first sight. Sir William Mackinnon, through whose judgment, foresight, and patriotism British influence had become predominant in East Africa, had died in June 1893. He was fated to see the company by no means a success commercially, yet it had accomplished a solid work in advancing the civilization of the dark continent. In exploring and development it could point to several successful expeditions: to the founding of the Scottish Industrial Mission at Kibwezi (which is now extinct), about 200 miles from the coast on the way to Uganda, and its connexion with the sea by a track known as the "Mackinnon road"; and to the establishment of telegraphic and telephonic communication between Mombasa and Lamu. It had set up a system of administration which had helped to create confidence and stimulate trade. In 1893 the cost of transport for a ton of merchandise between Mombasa and Uganda had been as much as £300. It had made pioneer experiments in transport, the results of which were reaped by later traders; its official reports afforded valuable information about the tribes of the interior, and under its administration more than 3000 slaves had been freed, though this is a small number compared with those saved in stopping the trade itself. The drink traffic, too, had been prohibited. On the successful termination of the Sudan war in 1898, the importance of its work in establishing British influence in the region of Victoria Nyanza became clear.

When the company's affairs were finally wound up in March 1897, it was found that in acquiring, developing, and administering the territories ultimately taken over by H.M. Government there was a total deficit of £193,757, 7s. 8d., which was made up as follows:—

(1) Outlay within the sultan of Zanzibar's 10-miles limit under deduction of all revenues	£139,404	14	1
(2) Outlay in the interior, including Uganda and Witu, under deduction of grants by Sir W. Mackinnon and friends of Church Missionary Society (£26,633, 13s. 6d.)	122,542	2	6
(3) Costs of all assets handed over to H.M. Government	145,780	12	4
(4) Home charges, including costs of charter less amount recovered on forfeited shares (£2825)	36,029	18	9
	Total	£443,757	7 8
Payment from H.M. Government		250,000	0 0
	Total deficit	£193,757	7 8

At the time of the company's liquidation the accounts showed a total revenue during the whole period of its existence of £171,469, 0s. 1d.

This was principally made up of:—

Gross customs collections	£89,067	3	10
Revenue from various sources, departmental and otherwise	51,373	15	4

The amount expended on the survey and construction of railways, tramways, &c., was more than £67,000.

THE BRITISH NORTH BORNEO COMPANY.

The occupation of the island of Labuan by the British Government in 1847 is the starting-point from which to trace the connexion of Great Britain with North Borneo. In 1872 the Labuan Trading Company was established in Sandakan, and in 1878, through the instrumentality of Mr Dent, the sultan of Sulu transferred all his rights in North Borneo to a syndicate, the chief promoters of which were Sir Rutherford Alcock, Admiral the Hon. Sir Henry Keppel, and Mr R. B. Martin. Early in 1881 the British North Borneo Provisional Association, Limited, was formed to take over the cession with all rights and properties. A petition was addressed to Queen Victoria for a royal charter in November 1881, and the British North Borneo Company, which was formed in May 1882, took over, in spite of some diplomatic protests on the part of the Dutch and Spanish Governments, all the rights, territorial and sovereign, in the original grants, and proceeded under the charter to organize the administration and development of the territory in question. The company has since acquired further territories: the Putatan river in May 1884, the Padas district in November 1884 (including two important rivers, the Padas and the Kalias), the Kawang river in February 1885, and the Mantanani islands in April 1885. In 1888 H.M. Government declared the whole territory to be under the protection of Great Britain, and thenceforth it was officially known as "The State of North Borneo." In 1890 the British Government placed the island of Labuan under the administration of the company. In March 1898, after the suppression of the Mat Salleh rebellion, arrangements were made whereby the sultan of Brunei transferred to the company all the sovereign and other rights over the districts north of the Padas river which had previously been in his possession. This cession was of the highest importance, for it meant that a large number of enclaves, which had formerly been resorts for disaffected natives, and therefore a continual source of annoyance, passed under the control of the company, which was also enabled to consolidate its somewhat scattered possessions into a compact territory. (See also BORNEO.)

Administration.—There are now ten Government stations on the coast administered by Europeans, and five inland, the most important being at Sandakan, Darvel Bay, and Gaya Bay. The entire population of the company's territory is estimated at 200,000, including some 20,000 Chinese, and about 150,000 of the population are distributed throughout the west coast. The population of Sandakan, the capital, is estimated at from 6000 to 7000.

The form of government adopted by the company is practically that of a British colony. It is vested in a court of directors, appointed under royal charter, administered by a resident governor with the assistance of a colonial secretary. Under them are three residents of districts, several assistant residents, and departments of the Government service, such as treasury, land and survey, public works, harbour, medical, judicial, and constabulary. At the head of the judiciary is the governor, who is the chief judicial officer of the supreme court and court of appeal. The residents are the senior judges and judges of the courts of appeal. There are also district magistrates and justices of the peace. The Indian penal code and the Indian Civil Procedure and Evidence Acts have been adopted almost as they stand, but the rights and customs of the natives receive special recognition, and the land regulations are so framed as to encourage immigrants. The higher officers of the Government form the legislative council. The native chiefs and headmen are responsible to the Government for the preservation of order in their own districts, a trust which they discharge on the whole remarkably

well. The Government police number about 500; the majority of these are Sikhs, with some Pathans and Dyaks.

Revenue.—The principal sources of revenue are the following: license for purchasing and retailing opium, spirits, &c., all of which are in the hands of private persons. Five to ten per cent. duty is placed on imports, and the same amount of royalty on jungle produce exported. The old source of revenue among the natives was a poll-tax, and this has been retained in lieu of land taxes; there is also a stamp duty. Proceeds of sales of Government land, quit-rents, and fees on transfers, make up the land revenue. Judicial fees and post and revenue stamps make up the sources of revenue.

When the company obtained its charter the northern portion of the island was in a state of chaos, the interior was divided up among a number of small chieftains whose authority was hardly recognized, and the coasts were devastated by pirates. All this has been changed, and at a rate of taxation which barely reaches one shilling and threepence per head of the inhabitants, as compared with five to twelve shillings in India, or six to sixteen shillings in Java. From an imperial point of view the change is no less remarkable. In 1881 the influence of Great Britain went for nothing. To-day she is mistress of the best part of the island, and her commerce is predominant.

Charters Towers, a municipality and mining town, Queensland, Australia, in the county of Devonport, 82 miles S.W. from Townsville, with which it is connected by rail. It is in the centre of an important gold-field, the output of which was valued, in 1899, at £1,216,750. Abundant water supply is obtained from the Burdekin river, about 8 miles distant. Altitude about 1000 feet. Population, 4597.

Charts.—A chart is a marine map intended specially for the use of seamen. It is constructed for the purpose of ascertaining the position of a ship with reference to the land, of finding the direction in which she has to steer, the distance to sail or steam, and the hidden dangers to avoid. The surface of the sea on charts is studded with numerous small figures. These are known as the *soundings*, indicating in fathoms or in feet (as shown upon the title of the chart), at low water of ordinary spring tides, the least depth of water through which the ship may be sailing. Charts show the nature of the unseen bottom of the sea—with the irregularities in its character in the shape of hidden rocks or sand-banks, and give information of the greatest importance to the mariner. No matter how well the land may be surveyed or finely delineated, unless the soundings are shown a chart is of little use.

The early charts were plane charts, drawn on the principle of the earth being an extended plane. This construction is suitable for harbours, coastal sheets, limited districts, such as the English Channel, or for coasts within the tropics, but becomes incorrect and even dangerous if used on voyages extending over the oceans. To remedy this defect, in 1569 Gerard Mercator, a Fleming, conceived

the idea of representing the earth's surface on a cylinder, in which the length of the degrees of latitude were increased as they approached the pole in the same proportion as those of longitude decreased on the globe. This idea was perfected about 1590 by Edward Wright, an Englishman, and it is on his principle that the present charts are

drawn on what is known as "Mercator's projection." The advantage of this projection to the sailor is that the ship's course between any two places is represented by a straight line. On a sphere the meridians all converge towards the pole, the degrees of latitude are equal, those of longitude decreasing towards the pole; on a Mercator's chart the meridians are drawn as parallel lines, and the degrees of longitude are all equal. To compensate for this error, the degrees on the Mercator chart are increased as they approach the pole beyond their actual lengths, in the same proportion as the degrees of longitude on the sphere diminish in length as they approach the pole. The length of a degree of latitude in the parallel of 70° is consequently three times that of a degree at the equator. It is, however, only when equatorial and polar regions are contrasted that the distortion becomes evident—contiguous countries and seas appear but little out of proportion to each other, and no other projection is known that so well meets nautical requirements. Distances on a Mercator chart are measured on the latitude scale, on the sides of the chart, taking care to use that part of the scale which is in the same latitude as the ship; e.g., distances between places within the parallels of 50° and 60° must be measured upon the latitude scale between 50° and 60° .

The British Admiralty charts are compiled, drawn, and issued by the Hydrographic Office. This department of the Admiralty was established under Earl Spencer by an order in council in 1795, and consists of the hydrographer, one assistant, and a draughtsman. The first hydrographer was Mr Alexander

Dalrymple, a gentleman in the East India Company's civil service. From this small beginning arose the important department which is now the main source of the supply of hydrographical information to the whole of the maritime world. The charts prepared by the officers and draughtsmen of the Hydrographic Office, and published by order of the lords commissioners of the Admiralty, are over 3100 in number. They are compiled chiefly from the labours of British naval officers employed in the surveying service; and also from valuable contributions received from time to time from officers of the royal navy and mercantile marine. In addition to the work of British sailors, the labours of other nations have been collected and utilized. Charts of the coasts of Europe have naturally been taken from the surveys made by the various nations, and in charts of other quarters of the world considerable assistance has been received from the labours of French, Spanish, Dutch, and American surveyors. The Admiralty charts are published with the view of meeting the wants of the sailor in all parts of the world. They may be classed under five heads, viz., ocean, general, and coast charts, harbour plans, and physical charts; for instance, the Indian Ocean, the Mediterranean, approaches to Plymouth, Plymouth Sound, and wind and current charts. The harbour plans and coast sheets are constructed on the simple principles of plane trigonometry by the surveying officers. (See *SURVEYING, Nautical*.) That important feature, the depth of the sea, is obtained by the ordinary sounding line or wire; all soundings are reduced to low water of ordinary spring tides. The times and heights of the tides, with the direction and velocity of the tidal streams, are also ascertained. These MS. charts are forwarded to the Admiralty, and form the foundation

of the hydrography of the world. The ocean and general charts are compiled and drawn at the Hydrographic Office, and as originals, existing charts, latest surveys and maps, have to be consulted, their compilation requires considerable experience and is a painstaking work, for the compiler has to decide what to omit, what to insert, and to arrange the necessary names in such a manner that while full information is given, the features of the coast are not interfered with. As a very slight error in the position of a light or buoy, dot, cross, or figure, might lead to grave disaster, every symbol on the Admiralty chart has been delineated with great care and consideration, and no pains are spared in the effort to lay before the public the labours of the nautical surveyors and explorers, not only of England, but of the maritime world; reducing their various styles into a comprehensive system furnishing the intelligent seaman with an intelligible guide, which common industry will soon enable him to appreciate and take full advantage of.

As certain abbreviations are used in the charts, attention is called to the "signs and abbreviations adopted in the charts published by the Admiralty." Certain parts of the world are still unsurveyed, or not surveyed in sufficient detail for the requirements that steamships now demand. Charts of these localities are therefore drawn in a light hair-line and unfinished manner, so that the experienced seaman sees at a glance that less trust is to be reposed upon charts drawn in this manner. The charts given to the public are only correct up to the time of their actual publication. They have still to be kept up to date. Recent publications by foreign Governments, newly reported dangers, changes in character or position of lights and buoys, are as soon as practicable inserted on the charts, and due notice given of such insertions in the Admiralty "Notices to Mariners."

During the year 1900, 102 new plates of charts and plans were engraved, 30 plates received the addition of 8 new plans, and 224 plates were largely improved by corrections and additions; 4520 corrections were made to the plates by the engraver; 35,500 received minor corrections at the hands of the draughtsmen, and 875 "Notices to Mariners" were issued. The number of charts printed for the requirements of the Royal Navy, and to meet the demand of the general public, during 1900, amounted to 580,207.

These facts show the necessity of charts being closely watched by sailors and shipowners using them, to insure their being supplied with the most recently corrected charts. The dates of the corrections are noted at the foot of the charts—those of large corrections, and additions, for which the charts have been cancelled, being written in full against the imprint; while the date of smaller corrections, such as changes in lights and buoys, are noted in Roman numerals on the left-hand lower corner. For the mercantile marine the Board of Trade collects and publishes the above information in a small pamphlet, *Notices to Mariners for Foreign-going Ships*. This pamphlet, supplemented by a weekly issue, is supplied free of charge to the ships of the mercantile marine.

The Admiralty charts, when issued from the London chart agent (J. D. Potter), have received all necessary corrections to date. Once out of his hands, there is no guarantee that further corrections are made before sale, by local firms at different ports; and purchasers should obtain some assurance that they are correct to date. The charts are also supplemented by the *Admiralty Pilots*, or books of sailing directions, with tide tables, and lists of lighthouses, light vessels, &c., for the coasts to which a ship may be bound. The physical charts are the continuation of the work so ably begun by Maury of the United States and FitzRoy of the Royal Navy, and give the sailor a good general idea of the world's ocean winds and currents at the different periods of the year; the probable tracks and seasons of the tropical revolving or cyclonic storms; the coastal winds; the extent or months of the rainy seasons; localities and times where ice may be fallen in with; and, lastly, the direction and force of the stream and drift currents of the oceans.

(T. A. H.)

Chaskoi, CHASKOVO, KHASKOI, HASKOI, or HASKOVO, the chief town of a department in Bulgarian Eastern Rumelia, 45 miles E.S.E. of Philippopolis. It has.

manufactures of carpets and woollens, and some trade in tobacco and silk. The quantity of cocoons raised in the district in 1899 was 109,218 kilogrammes, valued at £12,494. Population, 14,392.

Chassepot.—The Chassepot rifle, so named after its designer, was a modification of the Dreyse rifle—the so-called Prussian “needle gun” of 1841. It was adopted by France in 1866, and was the weapon with which her troops were armed in the Franco-German war of 1870-71.

It is a breech-loader, with its breech closed by a bolt very similar in shape and action to those now in use (see SMALL ARMS). The cartridge case is, however, cylindrical throughout, and of paper, with stout cardboard wads at the top and bottom, the percussion cap being imbedded in the latter, and also covered in rear with a disc of india-rubber. The bullet is rolled up in greased paper and attached to the case by the paper wrapping being extended over the sides of the case and bound with twine. The cartridge case plays no part in obturation (except the india-rubber disc over the cap, as will be explained), and the bolt therefore has to perform this function. The arrangements to effect this are as follows:—In front of, and attached to, the bolt proper is a mushroom-shaped bolt-head, capable of a slight longitudinal movement independent of the bolt. Threaded on to the spindle of the bolt-head, and between its rear face and the front of the bolt proper, is an india-rubber ring. On closing the bolt this ring is compressed between the faces of the bolt and bolt-head and forced outwards against the sides of the breech recess. When the rifle fires the pressure of the gas compresses the india-rubber still more, and so seals escape. (The arrangement is very similar to the “de Bange” obturator in heavy guns.) The escape round the striker point is fairly sealed by the india-rubber disc over the percussion cap. This is pierced by the striker, and is therefore blown back over the annulus between the striker and the hole for it in the bolt-head. The metallic self-obturing cartridge case was adopted by all nations very shortly after 1870, Great Britain having already done so in the Snider rifle in 1865.

The details of the Chassepot are:—

Weight with bayonet	10 lb 12 oz.
Weight without bayonet	9 lb 5 oz.
Length with bayonet	6 ft. 2 in.
Length without bayonet	4 ft. 4 in.
Calibre	·433 in.
Number of grooves	4.
Depth	·012.
Twist of rifling	{ one turn in 21·2 inches, left hand.
Sights { Highest for	1812 yards.
{ Lowest	219
Cartridge { Length	2·68 inches.
{ Weight	494 grains.
Bullet { Material	Lead.
{ Length	·98 inch.
{ Diameter	·465
{ Weight	386 grains.
Charge	86·4 (black powder).
Muzzle velocity	1328 feet per second.

(H. W. B.)

Châteaubriant, chief town of *arrondissement*, department of Loire Inférieure, France, 40 miles N.N.E. of Nantes. It has become an important railway centre on lines to Paris and Orleans. Population (1881), 3748; (1896), 5808, (comm.) 6884.

Châtelineau, a town of Belgium, in the province of Hainaut, on the Sambre, 27 miles E. of Mons, with a station on the railway between Charleroi and Namur. It has coal-mines and iron-works. Population (communal) (1880), 8290; (1897), 11,950.

Chatham, a municipal (1890) and parliamentary borough of Kent, England, on the Medway, adjoining the city of Rochester, 34 miles E.S.E. of London by rail. The town is divided into three wards, under a mayor, 6 aldermen, and 18 councillors. It has large and important naval and military stations, and a royal dockyard. Christ Church, Luton, was erected in 1885. Recent erections are a Congregational church, a town hall and municipal offices (opened 1900, cost about £28,000), a technical institute and school of art. Among the schools are a Royal Engineers' school of military engineering, a Royal

Marines' school, and two garrison schools. The royal dockyard has a river frontage of more than three miles and an area of about 500 acres. One basin is 800 feet wide, with a quay frontage of 6000 feet. The rope-house is 1140 feet long by 50 feet wide. The dockyard employs 7000 workmen. Extensive naval barracks are in course of construction, also a naval hospital. A pier was built in 1886, and belongs to the corporation, and a railway bridge over the Medway was finished in 1890. In front of the Royal Engineers' Institute is a statue (1890) of General Gordon, and near the railway station another (1888) to Waghorn, promoter of the overland route to India. Area of municipal borough, 4336 acres; population (1881), 26,424; (1891), 31,657; (1901), 36,937.

Chatham, an incorporated town and port of entry, Canada, New Brunswick, on the Miramichi river, 24 miles from its mouth and 10 miles by rail from Chatham junction on the intercolonial railway. The town contains the Roman Catholic pro-cathedral, 4 churches, 2 branch banks, and 2 newspapers, many large saw-mills, 2 pulp-mills, and several establishments for exporting fish. The lumber trade, the fisheries, and the manufacture of pulp are the chief industries. Exports in 1899-1900 were valued at \$1,483,563, imports at \$161,378. Population (1900), about 6000. The town is also called MIRAMICHI.

Chatham, a town and port of entry of Ontario, Canada, and the capital of Kent county, situated 64 miles S.W. of London, and 11 miles N. of Lake Erie, on the Thames River and the Grand Trunk, Canadian Pacific, and Lake Erie and Detroit River railways. There is also steamboat communication with Detroit. It contains an extensive waggon factory, planing and flour mills, manufacturing of fanning mills, woven wire goods, engines, windmills, &c. Incorporated as a city in 1895, it had a population of 7873 in 1881 and of 9068 in 1901.

Chatham Islands, a small group of islands forming part of New Zealand, 536 miles due E. of Lyttelton in the South Island. Little change has taken place since 1875, except that cultivation has somewhat extended, and the native population, the Morioris (who belong to the same race as the Maoris of New Zealand, and are but slightly modified by long isolation), have considerably decreased. The larger island of the group—Whairikauri—whose highest point reaches about 1000 feet, is remarkable for the number of lakes and tarns it contains, and for the extensive bogs which cover the surface of nearly the whole of the uplands. There are no indigenous mammals; the reptiles belong to New Zealand species. The birds—the largest factor in the fauna—have become very greatly reduced through the introduction of cats, dogs, and pigs, as well as by the constant persecution of every sort of animal by the natives. The larger bell-bird (*Anthornis melanocephala*) has become quite scarce; the magnificent fruit-pigeon (*Carpophaga chathamensis*), the two endemic rails (*Nesolimnas dieffenbachii* and *Cabalus modestus*), the one of which was confined to Whairikauri and the other to Mangare Island, have become exterminated. Several fossil or subfossil avian forms, very interesting from the point of view of geographical distribution, have in the interval been discovered by Dr H. O. Forbes, namely, a true species of raven (*Palaeocorax moriorum*), a remarkable rail (*Diaphorapteryx*), closely related to the extinct *Aphanapteryx* of Mauritius, and a large coot (*Palaeolimnas chathamensis*). There have come to light also the remains of a species of swan belonging to the South American genus *Chenopsis* and of the tuatara (*Hatteria*) lizard, the unique species of an ancient family now surviving only in New Zealand. The swan is identical with an extinct species found in

caves and kitchen-middens in New Zealand, which was contemporaneous with the prehistoric Maoris and was largely used by them for food. One of the finest of the endemic flowering plants of the group is the boraginaceous "Chatham Island lily" (*Myositidium nobile*), a gigantic forget-me-not, which grows on the shingly shore in a few places only, and always just on the high-water mark, where it is daily deluged by the waves; while dracophyllums, leucopogons, and arborescent ragworts are characteristic forms in the vegetation. The chief export from the group is wool, grown upon runs farmed both by Europeans and Morioris. There is also a small export by the natives of the flesh of young albatrosses and other sea birds, boiled down and cured, for the Maoris of New Zealand, by whom it is reckoned a delicacy. The imports consist of the usual commodities required by a population where little of the land is actually cultivated.

Chattanooga, capital of Hamilton county, Tennessee, U.S.A., in 35° 2' N. lat. and 85° 21' W. long., on the left bank of Tennessee river, just north of the state line, at an altitude of 681 feet. It is an important railway centre, being at the intersection of eight railways, five of which are trunk lines. In manufactures it is of great importance, its invested capital amounting in 1890 to \$7,400,000, with 5741 employees and an output of \$10,216,000, the leading industries being iron and steel. This city is the seat of the U.S. Grant University, a Methodist Episcopal institution, founded in 1867. In 1898 this had a faculty of 42 teachers and was attended by 491 students. The assessed valuation of the real and personal property of Chattanooga, on a basis of about 65 per cent. of the full value, was in 1900, \$12,552,090; the net debt was \$879,032, and the rate of taxation, including that for the state and county, \$27 per \$1000. During the Civil War a series of engagements took place near Chattanooga on 23rd to 25th November 1863, when Grant with 60,000 men defeated the Confederates under Bragg (40,000 to 50,000 men). The Federal losses were 5616, those of the Confederates 8684 and 6142 prisoners. Population (1880), 12,872; (1890), 29,100; (1900), 30,154, of whom 994 were foreign-born and 13,122 were negroes. Out of 9133 males of voting age, 1347 were illiterate (unable to write), of whom 1200 were negroes.

Chautauqua, a summer educational village on the shores of Chautauqua Lake, in western New York, U.S.A. The lake is a beautiful sheet of water, 1212 feet above the sea, 20 miles long, and one to two miles in width, and flows out by Conewango Creek into Allegheny river. The village is situated on the western side of the lake, near its northern end, at the terminus of the Chautauqua and Jamestown railway. It was founded in 1874 by the Chautauqua Assembly, and contains some 500 cottages, with hotels and numerous buildings for educational purposes. All municipal improvements, including water-supply, drainage, fire department, electric lighting, &c., have been provided. Every summer classes are held in literature, art, pedagogy, and kindred subjects, when the population is estimated at 10,000 and the attendance at the various schools at 1000 to 1500.

Chaux de Fonds, La, a town in the Swiss canton of Neuchâtel. It is 18½ miles N.W. of Neuchâtel by rail, and stands at a height of about 3281 feet in a

valley (5 miles long) of the same name in the Jura. It is still the centre of the watchmaking industry. In 1896 it exported watches to the value of nearly 2½ million pounds sterling. It boasts of being "le plus grand village de l'Europe," and certainly, despite many handsome buildings, has preserved some features of a big village. Population (1888), 25,603 (mostly Protestant and French-speaking); (1900), 35,890.

Cheboygan, capital of Cheboygan county, Michigan, U.S.A., situated on M'Leod Bay, Strait of Mackinac, in the northern part of the lower peninsula, at an altitude of 598 feet. It is a lumber city, and has considerable lake commerce. It is on a branch of the Michigan Central railway. Population (1880), 2269; (1890), 6235; (1900), 6489, of whom 2101 were foreign-born.

Chefoo, or CHIFU, a treaty port in the province of Shantung, China, 260 miles S.E. by E. of Peking. It has continued to show fair progress as a place of trade, but the total volume is inconsiderable, having regard to the area it supplies. In 1880 the total exports and imports were valued at H. taels 9,906,000 (£2,724,000), and in 1899 amounted to H. taels 28,154,000 (£4,228,000). Communication with the interior is only by roads, which are extremely defective, and nearly all the traffic is by pack animals. In the event of the German Government building the railways which are now in contemplation from their newly-acquired port of Kiaochow, situated on the south side of the peninsula of Shantung, it is probable that the trade of Chefoo will dwindle into insignificance. From its salubrious situation and the convenience of its anchorage, Chefoo has become a favourite rendezvous for the fleets of the European Powers in Chinese waters, and consequently it has at times been an important coaling station. It lies in close proximity to Korea, Port Arthur, and Wei-hai-Wei, and it shared to some extent in the excitement to which the military and naval operations in these quarters gave rise. The Chefoo convention was signed here in 1876 between Sir Thomas Wade and Li Hung-Chang.

Chelmsford, a municipal borough (1888), market town, and county town of Essex, England, on the Chelmer, 29 miles N.E. of London by rail, in the mid-parliamentary division of the county. It has agricultural implement and iron foundries, large electric light and engineering works, breweries, maltings, extensive corn-mills and large cattle and corn markets, a large tannery, and fine shops. The rateable value (1888) was £42,220, (1901) £61,460. Area of borough (a civil parish), 2033 acres. Population (1881), 9793; (1901), 12,580.

Chelmsford, Frederic Thesiger, 1st BARON (1794-1878), Lord Chancellor of England, was the seventh and youngest child of Charles Thesiger, and was born in London on 15th April 1794. His father, Charles Thesiger, collector of customs at St Vincent's, was the son of a Saxon gentleman who had migrated to England and become secretary to Lord Rockingham, and was the brother of Sir Frederick Thesiger, naval A.D.C. to Nelson at Copenhagen. Young Frederick Thesiger was originally destined, like another Chancellor, Lord Erskine, for a naval career, and he served as a midshipman on board the *Cambrian* frigate in 1807 at the second bombardment of Copenhagen. His only surviving brother, however, died about this time, and he became entitled to succeed to a valuable estate in the West Indies, so it was decided that he should leave the navy and study law, with a view to practising in the West Indies and eventually managing his property in person. Another change of fortune, however, awaited him, for a volcano destroyed the family estate, and he was thrown back upon his

prospect of a legal practice in the West Indies. He proceeded to enter at Gray's Inn in 1813, and was called on 18th November 1818, another change in his prospects being brought about by the strong advice of Mr Godfrey Sykes, a special pleader in whose chambers he had been a pupil, that he should remain to try his fortune in England. He accordingly joined the home circuit, and soon got into good practice at the Surrey sessions, while he also made a fortunate purchase in buying the right to appear in the old Palace Court, where were tried small causes arising within twelve miles of Westminster, and where only four counsel were privileged to practise. In 1824 he was briefed to defend Hunt when on his trial at Hertford with Thurtell for the murder of Mr Weare, and was considered to have distinguished himself in his conduct of the case; and eight years later at Chelmsford assizes he won a hard-fought action after three trials, to which he attributed so much of his subsequent success, that when he was raised to the peerage he assumed the title Lord Chelmsford in grateful remembrance of the circuit town and of that particular achievement. In 1834 he was made king's counsel by Lord Lyndhurst, and in 1835 was briefed in the Dublin election inquiry which unseated Daniel O'Connell. In 1840 he decided to enter Parliament. He accordingly contested Newark in the Conservative interest without success, but soon after obtained a seat as member for Woodstock. In 1844 he became solicitor-general in succession to Sir W. Follett, and was knighted, but having ceased to enjoy the favour of the duke of Marlborough, lost his seat for Woodstock and had to find another at Abingdon. In 1845 Follett died, and Sir Frederick Thesiger, who next to Follett had for long been the most popular and most successful advocate at the bar, succeeded him as attorney-general, holding the post until the fall of the Peel administration on 3rd July 1846. Thus by three days Thesiger missed being Lord Chief Justice of the Common Pleas, for on 6th July Sir Nicholas Tindal died, and the seat on the bench, which would have been Thesiger's as of right, fell to the Liberal attorney-general, Sir Thomas Wilde. Sir Frederick Thesiger remained in Parliament, changing his seat, however, again in 1852, and becoming member for Stamford. During this period he enjoyed a very large practice at the bar, his talents as an advocate causing him to be employed in many *causes célèbres*, including the action for breach of promise brought by Miss Smith against Lord Ferrers, his speech in which was highly praised, and the action arising out of an impostor's claim to be the son of Sir Hugh Smyth. On Lord Derby coming into office for the second time in 1858, Sir Frederick Thesiger was raised straight from the bar to the Lord Chancellorship (as were Lord Brougham, Lord Selborne, and Lord Halsbury). In the following year Lord Derby resigned and his Cabinet was broken up. Again in 1866, on Lord Derby coming into office for the third time, Lord Chelmsford became Lord Chancellor for a short period. In 1868 Lord Derby retired, and Disraeli, who took his place as Prime Minister, wished for Lord Cairns as Lord Chancellor. Lord Chelmsford was very sore at his supersession and the manner of it, but, according to Lord Malmesbury, he retired under a compact made before he took office. Ten years later Lord Chelmsford died on 5th October 1878, after having industriously fulfilled during his two periods of retirement from office the usual judicial functions that devolve upon an ex-Chancellor. Lord Chelmsford had married in 1822 Anna Maria Tinling, niece of Major Pierson, whose name is associated with the defence of Jersey. He left surviving him four sons and three daughters, of whom the eldest, second Lord Chelmsford, earned distinction as a soldier, while the third,

Alfred Henry, was made a lord justice of appeal and a privy councillor in 1877, at the early age of thirty-nine, but unfortunately died only three years later.

Lord Chelmsford was a brilliant and successful advocate rather than a distinguished lawyer or a great Lord Chancellor. He combined with ability and marked industry a high sense of honour and spotless integrity, while his fine presence and sparkling wit contributed to his success both in Parliament and his profession. Many stories are told of his ready tongue. "I have a right to deal with my witnesses as I please," said a learned serjeant once, when Thesiger had objected that he was suggesting answers to the person giving evidence. "My friend," said Thesiger promptly, addressing the court, "may deal, if he likes, my lord, but I submit that he must not lead." Lord Denman used to narrate how he had complained to Thesiger of the length of a certain barrister's speeches, "ever ending, still beginning." "Yes," said Thesiger; "his windings up are like the winding up of a watch, which only gives it a fresh start." On another occasion, Warren (author of the novel *Ten Thousand a Year*), who was always anxious to claim that he moved in high social circles, said, "I dined the other night at the duke of Leeds's, and—would you believe it?—there was no fish." "Indeed!" replied Thesiger; "I suppose they had finished it all upstairs." In 1869, when the House of Lords divided over the Irish Church Bill, a Conservative peer, seeing that Samuel Wilberforce was about to vote with the Government, remarked, "The Bishop of Oxford is going the wrong way." "No, no," said Lord Chelmsford; "he is going the road to Winchester"—a prophecy fulfilled when Mr Gladstone made Wilberforce bishop of Winchester later in the year. (E. A. AR.)

Chelsea, a city of Suffolk county, Massachusetts, U.S.A., situated in 42° 25' N. lat. and 71° 0' W. long., on a peninsula between Mystic and Chelsea rivers, and fronting on Boston harbour. Its manufactures employed in 1890 a capital of \$7,028,356 and 3470 persons. The value of the output was \$8,158,207, one-third of which consisted of rubber goods. The assessed valuation of property was in 1899 \$23,405,294, the net debt \$1,290,051, and the tax-rate \$17.40 per \$1000. Population (1880), 21,782; (1890), 27,909; (1900), 34,072.

Cheltenham, a municipal and parliamentary borough (one member) and market town of Gloucestershire, England, on the Chelt, a tributary of the Severn, 9 miles E.N.E. of Gloucester, 121 miles W.N.W. of London by rail. The place was little known until 1716, when its mineral water springs were accidentally discovered. It is now equally well known as a great educational centre and a health resort. Cheltenham College (incorporated 1894) and the Ladies' College are famous all over the world. There are several other large scholastic institutions, and a free library, art gallery, and museum. The architectural appearance of Cheltenham is deservedly admired. The parish church (St Mary's) is an old Gothic building, with an elegant spire. The town possesses twelve other places of worship connected with the Established Church, and twenty-three Nonconformist churches or chapels. The High Street contains many fine buildings (notably the new grammar school). The celebrated Promenade, the most beautiful and verdant of English streets, has been compared to Unter den Linden, Berlin. The town is well lighted (by electricity), well paved and drained, and has an excellent water-supply. There are other attractions in the shape of beautiful gardens (Montpellier and Pittville, the latter with a lake for boating) and splendidly equipped baths, both being the property of the corporation. The area of the municipal borough is 4677 acres. Population (1901), 49,439.

Chelyabinsk, a district town of Russia, 363 miles N.E. of Orenburg, on Mias river, situated at the east foot of the Urals, at the beginning of the lowlands of W. Siberia. It is the head of the Siberian railway, and is 428 miles by rail E.N.E. of Samara and 154 miles S.S.E. of Ekaterinburg, with which it is also connected by a railway. It is the centre of the trade in corn and produce of cattle, shipped to the Ural iron works. Population, 19,891.

CHEMISTRY.

THE final paragraph of the article CHEMISTRY in the *Encyclopædia Britannica*, ninth edition, vol. v. p. 544, although written at a time when Mendeléeff's classical essay, clearly defining the periodic character of the relationship among the elements, was barely five years old, may well be taken as an appropriate introduction to the present supplementary article, as calling attention to important points of view from which it is desirable, in the first instance, to consider the progress that has been made. It is as follows:—

The establishment of the periodic law may truly be said to mark an era in chemical science, and we may anticipate that its application and extension will be fraught with the most important consequences. It reminds us how important above all things is the correct determination of the fundamental constants of our science—the atomic weights of the elements, about which in many cases great uncertainty prevails; it is much to be desired that this may not long remain the case. It also affords the strongest encouragement to the chemist to persevere in the search for new elements.

DISCOVERY OF NEW ELEMENTS.

To deal first with the question of new elements. An interval of no less than twelve years elapsed between the discovery of indium (in 1863) and that of another new element, gallium (in 1875), but since the latter date our knowledge of the elements—the primary materials with which the chemist works—has been very considerably extended, ten or more having been added to the list, and now the number of well-defined species borders on eighty. Such discoveries serve a far higher purpose than that of gratifying the mere collector's instinct, for the introduction of law among the elements has led us to realize that progress in our knowledge of the true relationships subsisting between them generally depends more on the completion of the record than on anything else. As Mendeléeff himself pointed out in his Faraday lecture (*Trans. Chem. Soc.* 1889, p. 634):—

Before the promulgation of the periodic law the chemical elements were mere fragmentary incidental facts in nature; there was no special reason to expect the discovery of new elements, and the new ones which were discovered from time to time appeared to be possessed of quite novel properties. The law of periodicity first enabled us to perceive undiscovered elements at a distance which formerly were inaccessible to chemical vision, and long ere they were discovered new elements appeared before our eyes possessed of a number of well-defined properties.

Mendeléeff here refers to the fact that in his original essay he fully described in advance the properties of three elements, which he named ekaaluminium, ekaboron, and ekasilicium, and that elements were subsequently discovered which were found to be endowed with properties for the most part in closest accord with his predictions. Indeed it is from this circumstance more than any other, perhaps, that the periodic law at an early date acquired its extreme popularity. It will be evident from the following brief statements that the circumstances attending the discovery of new elements in recent times have often been of peculiar interest:—

Gallium = Ekaaluminium.—The discovery of gallium was made in 1875 by Lecoq de Boisbaudran (*C. R.* 81, p. 493, cf. *Ann. Phys. Chim.* (6) 2, p. 176), who was led by means of the spectroscope to recognize its presence in very minute proportion in a zinc blende from the Pyrenees. He afterwards found it in blendes from other sources. Although a very rare element, gallium seems to be widely distributed: thus Hartley and Ramage have shown that it is present in Cleveland iron ores (*Proc. R. Soc.* 1896, 60, p. 393), and have even separated it from the crude

blast-furnace metal; although, according to their estimate, only 1 part is present in 30,000 of the iron, the proportion is larger than in any other known material.

Scandium = Ekaboron.—The existence of this element was first noticed by Nilson in 1879, in the course of an examination of ytterbia prepared by Marignac's method from the rare mineral gadolinite. Cleve, who had succeeded in carrying the purification much further, shortly afterwards gave a description of the properties of scandium—remarkable for its completeness in view of the very small amount of material at his disposal—in which he proved that it corresponds to Mendeléeff's hypothetical ekaboron. According to Cleve, it is present in gadolinite and ytrotantalite to the extent of only about 0.005 per cent., but euxenite, according to Nilson, contains a larger proportion.

Germanium = Ekasilicium.—The original source of this element, and the only one known up to the present time, is argyrodite, a double sulphide of silver and germanium, $3\text{Ag}_2\text{S} \cdot \text{GeS}_2$ (*Jour. prakt. Chem.* 1886, 34, p. 177), of which several hundred kilogrammes were found in 1885 quite locally deposited in an adit in the Himmelsfürst mine near Freiberg. Clemens Winkler was led to recognize the presence of a new element in this mineral in consequence of the difficulties he experienced in effecting its analysis.

Since thorium has been required in quantity for the manufacture of the mantles devised by Auer von Welsbach as a means of producing the incandescent gas light, new and abundant sources of the minerals in which it is contained have been discovered. The attendant earths are consequently almost waste products, and the designation "rare earths," which has so long served to characterize the oxides of the yttrium-cerium group of elements, is scarcely applicable. The field of work that these elements present is one of extraordinary difficulty, and we are clearly still but at the threshold of knowledge. The history of discovery in this branch of chemistry has been set out in a clear and concise manner by the Scandinavian chemist Cleve—the highest living authority on the group—in a lecture delivered in memory of the Swiss chemist Marignac, who specially devoted himself to the investigation of the rare earths (*Trans. Chem. Soc.* 1895, p. 468). Crookes, a noted worker in this field, who has added very largely to the methods of discriminating the rare earths, has fully discussed the question of the individuality of the various earths in two presidential addresses to the Chemical Society of London (*Trans. Chem. Soc.* 1888, p. 487; 1889, p. 257). Cleve classes the elements of the group in two divisions—one containing "perfectly characterized," the other "not yet thoroughly characterized" elements. The former includes the following four new elements:—

Yttrium-cerium group.

Ytterbium.—This element was isolated by Marignac in 1878 from erbia separated from gadolinite, and was subsequently studied by Nilson. It yields a white oxide and colourless salts; its spark spectrum is rich in lines, although its salts have no absorptive effect.

Samarium.—Attention was called to the existence of a new element in the earths from samarskite in 1878, first by Delafontaine, and soon afterwards by Lecoq de Boisbaudran; their observations were extended by Marignac in 1880, but we owe our knowledge of samarium mainly to Cleve (*Trans. Chem. Soc.* 1883, p. 362; cf. Bettendorf, *Liebig's Annalen*, 1891, 263, p. 164). The oxide of

samarium is white; its salts are yellow, and are characterized by definite absorption spectra.

Gadolinium.—This element was discovered in 1880 by Marignac among the samarskite earths; it was subsequently studied by de Boisbaudran, Cleve and Bettendorf. Its oxide and salts resemble in appearance those of ytterbium, but it has a much lower atomic weight than that element.

Praseodymium and Neodymium.—*Didymia*—one of the most fully studied of the rare earths—which yields salts either rose-red or violet in colour, was always regarded as a definite substance until Auer von Welsbach, in 1885, by an extended and most laborious series of fractional crystallizations of the mixed nitrates of ammonium, lanthanum and didymium, succeeded in resolving it into two constituents, praseodymia and neodymia. The former gives green salts and solutions, the latter amethyst-coloured salts and rose-coloured solutions. The elements differ in atomic weight by nearly three units, but while the contrast between their physical properties is very marked, they differ chemically to an extraordinarily slight extent. Auer's observations have been abundantly confirmed, except that, curiously enough, it has been shown by both Brauner and Jones that in assigning atomic weights to the two elements he interchanged the values. But opinion is divided as to the individuality of the products described by Auer. Cleve, while accepting praseodymium as a new element, doubts the individuality of neodymium (cf. Muthman and Stritzel, *Ber. deut. chem. Ges.* 1899, 32, p. 653). Crookes goes farther, and points out that when the absorption spectra of the two substances are superposed, a spectrum is obtained nearly identical with that of the original didymia, except that two bands are missing. From this circumstance it might be presumed that a third substance is present, but his own work on the fractionation of didymia leads him to conclude that it must not be regarded as compounded of only two, but rather as an aggregation of many closely allied elements. Krüss and Nilson have arrived at a similar conclusion.

Victorium.—In discriminating the elements of the yttrium-cerium group, the spectroscope plays an all important part, several of them being characterized by their absorption spectra, whilst others, although they exert no absorbent action in solution, afford definite spark-spectra. A third method introduced by Crookes consists in submitting the oxides, or preferably the basic sulphates, to the influence of the negative electric discharge *in vacuo*, and viewing the phosphorescence thus produced with the spectroscope. By a refinement of this method—by photographing the spectrum of the phosphorescent light, using lenses and prisms of quartz—he has been able to study the invisible ultra-violet spectra afforded by the rare earths, and in consequence to detect and separate a new element—victorium—from yttria. Starting from crude yttria, separated in the ordinary way from metals of the cerium subgroup, and subjecting the nitrate prepared from this, time after time, to the well-known process of alternate heating and then boiling the partially decomposed salt with water, thereby separating each time an insoluble basic nitrate from a soluble nitrate, he obtained fractions giving different spectra—a group of lines high up in the ultra-violet attaining a maximum brilliancy in certain intermediate fractions. By fractionally recrystallizing the oxalates prepared from these intermediate fractions a great number of times, further concentration was effected of the substance affording the spectrum referred to. Resort was then again had to the nitrate method; and finally fractions selected with the aid of the spectroscope as likely to be the richest were converted into sulphates, and fractionally precipitated by potassium sulphate. The substance

ultimately isolated in this manner contained the new element, victorium.

Cleve's list of "not yet thoroughly characterized" elements of the yttrium-cerium group contains holmium, thulium,—these two he himself discovered in ordinary erbia, but has not yet satisfactorily separated,—terbium and dysprosium, and in addition a dozen or more not yet dignified with names the existence of which is suspected by Crookes or de Boisbaudran in various earths (cf. Demarçay, *C. R.* 1900, 130, p. 1185; 131, p. 387).

The inchoate state of knowledge of the rare earth elements will be sufficiently inferred from the foregoing statements; it may safely be said that no single element of the group is known in a state of practical purity, or can be regarded as "thoroughly characterized."

With a view of redetermining the densities of the elementary gases, and thus obtaining data for the further discussion of Prout's hypothesis that the atomic weights of the elements generally stand in simple relation to that of hydrogen, Lord Rayleigh was led, in the course of experiments commenced in 1882, to redetermine the density of nitrogen. Operating with the gas prepared by various chemical interactions, as well as with that separated from atmospheric air, he was led, in 1894, to discover that the nitrogen from air was very distinctly denser than that prepared from any nitrogen compound, a litre of the former weighing under standard conditions 1.2572, and one of the latter only 1.2505 gram. Having considered and tested the various possible explanations of the anomaly, Lord Rayleigh was at last led to ask what was the evidence on which the prevailing view was founded that the inert residue from air is a single substance. It then appeared that this was based entirely on the experiment made as far back as 1785 by the celebrated Cavendish, in which what was then called "phlogisticated air," i.e., nitrogen, was combined with oxygen by passing sparks from a frictional electric machine through a mixture of the two gases confined over potash, and so converted into nitre. On repeating the experiment Lord Rayleigh obtained results in accordance with those described by Cavendish, a small residue of uncombined gas being always left; and as he found that this residue was in proportion to the amount of air operated upon, and that its spectrum was not that of nitrogen, the initial discovery of a previously unknown constituent of our atmosphere was made. Meanwhile Ramsay had also succeeded in obtaining a gas differing from nitrogen, by passing air deprived of oxygen, etc., over heated magnesium—a well-known absorbent of nitrogen. Pursuing the investigation conjointly, Rayleigh and Ramsay ultimately proved that the superior density of atmospheric nitrogen is due to the admixture of a small proportion (about 1 per cent.) of a gas which they have termed argon (*q.v.*)—on account of its complete chemical indifference—of superior density to nitrogen in the ratio 14.003 : 19.9 (cf. *Phil. Trans.* 1895, A. p. 187).

At the time the discovery of argon was made public, Ramsay's attention was called by Miers to an observation recorded by an American chemist, Hillebrand, that on boiling the mineral uraninite with acid a gas was given off which appeared to be nitrogen. On examining cleveite, an allied uranium mineral, Ramsay obtained a gas almost free from nitrogen, and having observed that its spectrum contained a yellow line close to, but not coincident with, the D lines characteristic of sodium, he submitted it to Crookes for examination. On mapping the spectrum, Crookes found that the line referred to was the line D₃ first noticed by Lockyer in 1878 in the spectrum of the solar chromosphere, and ascribed by Frankland and Lockyer to a hypothetical element helium. Helium very

Gases of the atmosphere.

Argon.

closely resembles argon, being also an entirely inert gas; its density is only about twice that of hydrogen (cf. *Proc. Chem. Soc.* 1895, p. 59; *Trans. ditto*, 1895, p. 1107; *Proc. Roy. Soc.* 60, p. 442). Helium has since been

extracted from a variety of minerals consisting of salts of uranium, yttrium, thorium and other rare earths. It is present in the gas evolved from the Bath springs and in other natural waters. Dewar has shown that it may be separated from the Bath spring gas by subjecting this to a process of fractional liquefactions by means of liquid air (*Proc. Chem. Soc.* 1897, p. 187). By adopting such a method, as well as by the fractional distillation of liquefied argon and liquefied air, Ramsay and Travers have more recently succeeded in obtaining evidence of the presence in excessively minute proportions of three other inert gases besides helium and argon in air; they have named these neon, krypton, and xenon. In the account of their work laid before the Royal Society on 30th November 1900, the relative density of neon was stated to be nearly 10 (9.97), that of krypton 40.88, and that of xenon 64. The quantities of the three gases dealt with were so small, however, that these values must be regarded as provisional. When vacuum tubes charged with the gases are excited, that containing neon assumes an intense flame colour, the krypton tube a pale violet, and the xenon tube a sky blue. Neon can be liquefied only with the aid of liquid hydrogen. Krypton melts at -169° and boils at about -152° , whilst xenon melts at -140° and boils at -109° ; the melting-point of argon, it may be mentioned, is -188° , and its boiling-point -186.4° . They appear to resemble helium and argon in properties. According to Liveing and Dewar (*Proc. Roy. Soc.* 1901, 67, p. 467), the spectra of the more volatile gases of atmospheric air and of the Bath spring gas which are not condensed at the temperature of liquid hydrogen contain numerous lines occupying positions very near to those assigned to lines in the spectra of the solar corona and of the aurora. It may, therefore, be anticipated that yet other elements will be discovered in the air.

Shortly after the discovery of the Röntgen rays, the discovery, if possible more remarkable, was made by Henri Becquerel that uranium salts have the power of emitting rays capable—even after traversing thin sheets of glass, ebonite, and metals—of producing photographic effects, as well as of rendering air a conductor of electricity. Thorium compounds were subsequently found to emit similar rays. The early experiments appeared to show that the intensity of the effect was proportional to the amount of uranium present, the metal being more active than any of its salts; but it was then found that certain uranium minerals—pitchblende and chalcocite—were more active even than the metal. Led by this fact, M. and Mme. Curie undertook the investigation of these materials, and succeeded in showing that at least two radio-active “elements” are present in them. One of these, polonium, occurs along with bismuth in the precipitate produced by sulphuretted hydrogen in a solution of the mineral in acid. The other, radium, occurs in the barium chloride prepared from pitchblende. Barium chloride so obtained is not only characterized by great radio-activity, but also affords a spectrum in which there are a number of lines not hitherto noticed in the spectrum of any element. Moreover, according to Mme. Curie, the atomic weight of radio-active “barium” increases as the intensity of the radiant effect increases, a substance exerting an activity 3000 times that of uranium giving the value 140, while in one exerting an activity 7500 times as great the value is as high as 145.8. Her latest determination, made with a substance which, from its spectrum, appeared to contain rather more

radium than barium, gave the value 174. Quite recently (*Proc. Roy. Soc.* 1900, p. 409) Crookes has shown that the uranium salts of commerce may be purified until free from radio-activity, one method being to re-crystallize uranium nitrate from ether, in which it is readily soluble. Crookes proposed to term the radio-active constituent—which becomes concentrated in the residue—provisionally Ux. It closely resembles “radium,” but its exact nature remains to be determined. According to Crookes, polonium is distinguished from radium by the inability of the rays which it emits to penetrate glass. Radium compounds are self-luminous even after they have been kept for months in the dark. Hitherto only uranium and thorium minerals have been observed to exhibit radio-activity, and apparently the property is common to all of these. As a small proportion of radium raises the atomic weight of barium considerably, it is evident that the “element” must have a high atomic weight; its constant and exclusive association in nature with the two elements of highest atomic weight known is therefore particularly remarkable.¹ It will be noticed that in the case of the rare-earth metals, the elements from air and the radio-active elements, the discovery of new elements has frequently been consequent on the introduction of novel methods rather than on the discovery of new materials: in fact, in only one case, that of germanium, has a previously untouched material been dealt with.

CLASSIFICATION OF ELEMENTS.

Before discussing the bearing of the new discoveries of elements, it is necessary to consider briefly the rectifications effected in our knowledge of atomic weights within recent years. It must be remembered that although atomic weight is the factor of primary importance in the classification of the elements from the point of view of the periodic law, it can obviously only serve as a basis of classification in cases in which it is clear that the value has been ascertained with a sufficiently close approach to accuracy. It is therefore one of its chief recommendations that the law itself affords a means of correcting atomic weights; indeed its acceptance as a valid generalization has been most materially promoted by the manner in which Mendeléeff's early proposals to alter the values assigned to a number of the rarer elements have been justified. To understand this, it is only necessary to bear in mind that when the elements are arranged in the order of atomic weight, instead either of an irregular or of a continuous variation in properties, a more or less obviously regular periodic variation is noticed—a given property coming to a maximum, then gradually diminishing to a minimum, from which point it again rises to a maximum. Consequently, at intervals throughout the series, elements are met with having similar properties. These elements serve as guide-posts, and in constructing a table are placed in corresponding positions. This principle being recognized, it is possible to locate correctly elements of which the atomic weights are but approximately known. Thus osmium, iridium, and platinum were at the outset placed by Mendeléeff in advance of gold, although their then accepted weights were superior to that of gold, for the reason that the other platinum metals, as well as iron, cobalt and nickel, came in advance of the superior terms of the family in which gold is included. Determinations made by Seubert completely justified Mendeléeff's action, while

¹ According to Debiere, pitchblende contains a radio-active “element” of the iron group, resembling thorium in its properties—actinium. Hofmann has separated from a number of rare-earth minerals an element resembling lead, but distinguished by radio-activity, the equivalent of which is about 65, and the atomic weight perhaps about 260.

Krüss, Mallet, and Thorpe and Laurie have shown that the value long accepted for gold needs but slight correction. Again, although the values assigned to titanium ranged from 48 to 57, Mendeléeff gave the preference to the former number as placing titanium relatively to silicon in the same position that vanadium bears to phosphorus, and it was shown by Thorpe in 1885 that 48 is the correct value.

Tellurium alone is regarded by some as an exception. Being a member of the sulphur family it should come between antimony and iodine, just as sulphur comes between phosphorus and chlorine, and consequently its atomic weight should be lower than that of iodine. This has not yet been found to be the case,¹ but there are special difficulties attached to the determination of the atomic weight of this element, and there is reason to suppose that the determinations are affected with unperceived constant errors. At the time Mendeléeff's first essay was published in 1871, only the equivalents were known of a number of the elements, and it is therefore noteworthy that, solely from a consideration of their properties, he came to the conclusion that it was necessary to take as the atomic weights other multiples of the equivalents than those commonly adopted in the case of beryllium, yttrium, indium, lanthanum, cerium, didymium, thorium and uranium. Excepting in the case of lanthanum his proposals have all been justified. Results such as these certainly justify his statement that the periodic law enables us to master the facts relating to atomic weights, whereas before it was formulated atomic weights were purely empirical numbers, which could never be directly tested by considering the values themselves but only by critically examining the methods by which they were ascertained. The work done by Stas, and those who have been fired by his example, in seeking to place the determination of atomic weights on the most exact basis possible, will be more appropriately referred to later.

It is impossible to overlook the importance of the discovery of so many new elements as have been referred to; obviously we cannot be too cautious in any conclusions we may deduce as to the number likely to exist, and especially in imposing any narrow limit. Moreover, the discovery of elements like argon, helium, etc., destitute of positive chemical properties, opens out an altogether fresh field of view, and at the same time greatly increases the difficulty of the discussion. What positions are to be assigned to them in the periodic series? On what basis are they to be classified? As all the elements previously known are chemically active substances, and as there is nothing to foreshadow the existence of inert elements, chemical considerations afford no help in such a case, and it is only possible to classify them on the basis of their atomic weights. Their molecular weights can be deduced from their densities, but what of their atomic weights—the data by which alone their position can be decided? Rayleigh and Ramsay have found the ratio of specific heat at constant pressure to that at constant volume in argon to be 1.66:1, which is the theoretical ratio for a gas in which all energy imparted at constant volume is expended in effecting translatory motion; they therefore assume that, like mercury, argon is a monatomic element. Helium, according to Ramsay, for a similar reason is also monatomic; in fact, all the companions of argon in air appear to exhibit "monatomic" behaviour. On this view the atomic weight of helium is about 4, whilst that of argon is about 40. The former could be placed without difficulty between

hydrogen and lithium, but as the value 40 belongs to calcium, a place cannot be found for the latter. The element most nearly resembling argon is nitrogen. As we know it in atmospheric air, this is by far the least active of the elements, and yet we are satisfied that atomic nitrogen is gifted with intense affinities. The inactivity of molecular nitrogen, N_2 , may be ascribed to the exhaustion consequent on the union of two atoms which attract and bind each other so firmly that little opportunity is left for them to exercise external influence. It is only necessary to apply and somewhat extend this view to find an explanation of the apparently absolute indifference manifested by helium, argon,² and similar gases. None of the non-metallic elements are known as monatomic molecules under any ordinary conditions; in fact, only metallic elements affect a monatomic state except at very high temperatures, and as the known *gaseous* elements—hydrogen, oxygen, nitrogen, fluorine, chlorine—all occur as diatomic molecules, it is permissible provisionally to make the assumption that this is true of helium and argon. Helium then follows hydrogen, and argon fluorine, both being appropriately placed after elements of exceptional activity. A difficulty of another kind, to which Crookes has specially drawn attention, occurs in the case of the rare-earth group of elements, of which, as already indicated, besides the considerable number now known, there is reason to believe many more exist. The differences they exhibit, judged by chemical standards, are extraordinarily slight; often there is at most a minute difference in basicity or solubility which makes it possible to separate one from the other by a process of fractionation repeated perhaps many hundred times. Are such slight differences to be regarded as proof of chemical individuality? Crookes thinks not. His views on didymia have already been referred to. Another case is that of yttria. Starting from as definite a substance as possible, prepared in such a manner that it would be commonly regarded as pure, he has succeeded, by long-continued fractionation, in separating from it six distinct fractions, each of which affords a spectrum in which the dominant band is a different member of the set of bands in the phosphorescent spectrum of the original material. Crookes does not consider, however, that the yttria is in this way separated into distinct earths. To explain these results, as well as those obtained in other similar cases, he has introduced a novel conception—that of *meta-elements*: that is to say, he would modify and widen the conception of an element, and would substitute that of an elementary group composed of meta-elements. His conception of an element may be gathered from the following passage:—

Definition of an element.

In defining an element, let us not take an external boundary, but an internal type. Let us say, *e.g.*, the smallest ponderable quantity of yttrium is an assemblage of ultimate atoms almost infinitely more like each other than they are to the atom of any other approximating element. It does not necessarily follow that the atoms shall all be absolutely alike among themselves. The atomic weight which we ascribe to yttrium, therefore, merely represents a mean value around which the actual weights of the individual atoms of the "element" range within certain limits. But if my conjecture is tenable, could we separate atom from

² In the very stable gases the atoms in the molecule are combined very firmly, and therefore little internal work is done on heating them; in the less stable, the combination being looser, more work is done internally on heating. The ratio C_p/C_v , on this assumption, should be greater for the more stable gases, as appears to be the case judging from the values given by Clausius:—

O_2	N_2	H_2	Cl_2	Br_2
1.40	1.41	1.41	1.30	1.29

If helium and argon are He_2 and Ar_2 , and the atoms are gifted with a very high degree of mutual affinity, the molecules might well be so stable that no internal work is done on heating the gases.

¹ Steiner, however, by analysing tellurium diphenyl, $TePh_2$, has arrived at the value 126.4 (*Ber. deut. chem. Ges.* 1901, p. 570).

If the periodic generalization give any clue whatever to the nature of the elements and the character of their inter-relationship, it certainly tends to justify the conclusion that a genetic relationship exists between them. It is, in fact, impossible for any one fully imbued with the facts of organic chemistry to avoid being struck by the obvious, although often distant, analogies presented by the elements to genetically-related carbon compounds—analogs which are the more remarkable in that the exact mass relationships met with in the case of such compounds are not apparent among the elements. But as so many arguments have been advanced in support of the view that the elements undergo decomposition at high temperatures, it is perhaps well to note here that the evidence of genetic relationship among them is entirely inferential. Judging from the chemist's point of view, no valid proof of the occurrence of elementary dissociation under terrestrial conditions has yet been given, while as to its occurrence under solar or stellar conditions, until the interpretation which it is sought to put upon spectroscopic observations is accepted by those who should be best able to appreciate their force, the subject is one on which we can only hold our judgment entirely in abeyance. The discovery of helium justifies the belief that several new elements may yet become known having lower atomic weights even than oxygen. Therefore supposing that genetic relationships exist, since in a large proportion of cases corresponding elements among those having small atomic weights differ in atomic weight by very nearly 16 units, and since successive elements differ in so many cases by about a single unit, the assumption may be made that the series from hydrogen to oxygen should comprise a period of 16 terms. It then becomes a question whether the remaining elements can be arranged below these. An attempt to answer this is made in the preceding Table; the results are both remarkable and encouraging.

The first line or period calls for no special comment. Noteworthy points in the second period are the appearance of magnesium in a column in advance of that containing beryllium, and of phosphorus as the analogue of an unknown element coming between nitrogen and oxygen. No serious objection can be taken to such results, as beryllium in some respects more closely resembles aluminium than magnesium, and nitrogen and phosphorus, though they are in many ways analogous elements, also differ in important particulars. In the third period the homology difference 16 changes at the twelfth term, and owing to a sudden increase in the progression difference becomes 20 between silicon and titanium. Proceeding by units, vanadium and chromium take up their proper positions, but scandium, it will be noticed, occupies position 43, whereas the atomic weight at present assigned to it is 44; as it occurs together with elements of much higher atomic weight it is not unlikely that the value is over-estimated. In the fourth period many points of interest are brought out. Proceeding from chromium by units, manganese and iron take their proper places, but it then becomes impossible to proceed by units, as copper and zinc would be thereby entirely thrown out of position. If, however, the assumption be made that cobalt and nickel are members of the iron group, *i.e.*, immediate homologues of iron instead of terms in the progression series (also that perhaps they are "isomeric" elements), order may be restored by proceeding from them, copper being thus brought into the eighth or magnesium group, of which it is not an inappropriate occupant; but zinc must then be reckoned in the same family. It will be seen that "steps down" again occur in two (the eleventh and twelfth) groups in place of the one in the previous period; if, however, the atomic

weight of gallium be over-estimated by about two units, progression might occur as in the previous period. The subsequent values are arranged so as to secure the proper position for bromine, the atomic weight of which is certainly known with a close approach to accuracy. Arsenic is in consequence placed in the fourteenth group instead of in the fifteenth, next to selenium, and the weight assigned to this latter element is two units below the value at present accepted, which is certainly an anomalous value, bearing in mind the fact that the difference between sulphur and chlorine is more than three units. Little can be said of the fifth period as it contains so few elements. In the sixth period the conditions appear to be similar to those in the fourth, but the tendency to the development of extended families is even more marked. The value 124 is assigned to tellurium in order to bring iodine into position, and antimony is in consequence thrown somewhat out of its usual position; in addition, the atomic weight assigned to it is a unit higher than the preferred value deduced from Cooke's determination. In the seventh period the probable existence of families of immediate homologues is again forced upon the attention. Thus caesium, like rubidium, does not follow in the immediate order of progression; nor does barium, but like zinc, strontium, and cadmium, seems to belong to an *extended* family of which the superior terms are missing. The mystic elements of the cerium group closely follow barium. Whether the period terminates shortly afterwards with a final term having an atomic weight near to 154, or whether a great development of the rare-earth elements occur in it, so that the period terminates with tantalum and tungsten, it is impossible to say. The eighth (or ninth) period comprises the heaviest of the platinum metals and a number of other heavy metals; it clearly comes to an early close. The last period (the ninth or tenth) has at present only two representatives, and of these uranium must be almost the final term; perhaps radium belongs to this period.

Such a treatment of the subject obviously brings into prominence the possible existence of a far larger number of elements than has hitherto been contemplated, and attention is specially directed by it to the probable occurrence of numerous sets of closely-related elements besides the long-recognized three triads which appear in the fourth group (Fe, Co, Ni—Ru, Rh, Pd—Os, Ir, Pt). The extreme importance of extending the search for new elements in every possible direction is thus brought into view.

ATOMIC WEIGHTS.

As atomic weight is the ultimate criterion of position, everything depends on the exact determination of the proportions in which the elements combine. The field of investigation open to the chemist in this direction is immense, and there is none in which he can labour with greater advantage; it is a fortunate circumstance that an enthusiastic and most skilful band of workers in America is engaging in such labours with rare devotion. If the arrangement of elements above adopted be in any way justified, it is clear that considerable alterations must be made in the atomic weights of elements in a number of instances—even in cases in which the determinations have been carried out with such care that the results are commonly regarded with confidence. When the methods which have been adopted are studied, it is obvious that in not a few cases, although extreme care may have been taken in the actual determination of the numerical values, the proof obtained that the material dealt with has been free from all admixture is often far from complete. Much more must be done in

Exact determinations of atomic weights needed.

future to characterize the materials used, either by means of spectroscopic examination or by methods of equivalent delicacy—if indeed such can be found; so-called chemical methods must often prove too coarse for such purposes. The difficulty—it may almost be said the impossibility—of separating the constituents of mixtures of isomorphous substances under limited conditions is well known, but it may well be that some of the materials hitherto regarded as uniform single substances are in reality mixtures of this kind. The need of studying the rare earths from such a point of view is beyond question; indeed, it is time that the opportunities which this group of elements presents of solving some of the most difficult but entrancing problems in chemistry were appreciated. But there can be little doubt that the main sources of error in estimating atomic weights occur in carrying out the operations, and that constant unperceived errors often affect determinations which have been conducted with the most scrupulous care.

The conception that a genetic relationship exists among the elements almost necessarily involves the idea that their

**Relation-
ships of
atomic
weights.** atomic weights are in some way commensurable numbers. Prout first gave expression to this view in his well-known hypothesis that the atomic weights of the elements generally are exact multiples of that of hydrogen. Stas commenced his work fully persuaded of the validity of this hypothesis, but his results led him to an entire change in his opinion, and the tendency of all modern investigations has been to disprove it. Nevertheless the feeling remains that the question is still open. Thus Mallet, in his lecture delivered in memory of Stas (*Trans. Chem. Soc.* 1893, 35), after fully discussing the question, said:—

But the fact that so many well-determined atomic weights, referred to hydrogen as unity, present numbers *nearly approaching* integers, is very striking, and calls for further investigation. The writer of this paper is in a position to quote Stas himself as admitting this much. Having enjoyed the pleasure of a conversation of considerable length with the eminent Belgian chemist at his home in Brussels in the summer of 1887, and having urged upon him the improbability of this near approach to integer values for so many atomic weights being due to chance alone, the writer was answered by the remark, “*Il faut croire qu’il y a quelque chose là-dessous.*”¹

Apart from Stas’s great work, which can now be studied without difficulty in the three volumes of his *Œuvres complètes* published after his death, no more important or more interesting literature dealing with this subject can be consulted than that relating to the numerous and persistent attempts made during recent years to fix the ratio between hydrogen and oxygen. The problem has engaged

¹ In view of this pronouncement, it may be well to direct attention to the opinion expressed by Mendeléeff in 1871 in his original essay on the periodic law (*Liebig’s Ann.* sup. viii. p. 206): “Even if it be allowed that the matter of elements is entirely and uniformly the same, there is no reason to presuppose that n parts by weight of an element, or n atoms, in being changed to an atom of the second element, would produce the same n parts by weight; or that the atom of the second element will be n times heavier than in the first case. The law of the conservation of weight can be regarded as a special case of the law of the conservation of energy, or of motion. Weight is, of course, caused by a special kind of motion of matter, and no reason exists for denying the possibility of a transformation of these motions in the formation of elementary atoms into chemical energy or one or other form of motion. Two of the phenomena that are to be observed in elements, viz., the constant weight of atoms and the impossibility of further decomposing them, have hitherto been in intimate, even historical connexion; if then a known element should decompose or a new one be formed, these phenomena might be attended by an increase or reduction of weight. In this way, moreover, the difference in the chemical energy of various elements might to a certain extent be explained. But in giving expression to this theory, I intend nothing further than this, that there is a certain possibility of bringing the opinion tacitly entertained by chemists of the composite character of the elements into harmony with the non-acceptance of Prout’s hypothesis.”

the attention of workers all over the civilized world, and we are much indebted to the American chemists, and to Morley in particular, who have spared no trouble to arrive at trustworthy results. Stated in very few words, the result uniformly arrived at is that far from being in the integral ratio 1:16, which was so long accepted, the two atomic weights stand to each other in the relation of 1:15.88. But the difficulty of attaining to finality in such work is well illustrated by the case of nickel and cobalt. These elements have over and over again attracted attention on account of their atomic weights being so nearly alike. Recently Richards, assisted by Cushman and Baxter, has again attacked the problem, and the accounts given of the work are such as to impress the reader with the greatest confidence in the results. A variety of independent methods was used, and the consistency of the results obtained is remarkable. The conclusion ultimately arrived at is that cobalt has a slightly higher atomic weight (59) than nickel (58.7). Unfortunately, however, this does not settle the question, for, as Mallet observes in his Stas lecture—after pointing out that the general tendency of investigation up to that time had been to assign to cobalt a rather higher atomic weight than to nickel—on comparing the properties of the three sets of metals—Fe, Co, Ni—Ru, Rh, Pd—Os, Ir, Pt—cobalt plainly occupies a position intermediate between iron and nickel, and therefore its atomic weight should be lower than that of nickel. No better example can be given of the severity of the struggle that is being waged between theory and practice, and of the difficulty with which the victory is to be won.

Those desiring to study the subject of atomic weights more fully should consult F. W. Clarke’s *Recalculation of the Atomic Weights*, issued by the Smithsonian Institution in 1897. In this invaluable monograph reference is made to all that had been done in this department of chemistry. The subject is kept up to date in the annual reports published in the *Journal of the American Chemical Society*.

MOLECULAR WEIGHTS.

The conception the chemist forms of the properties of an element is a very complex one, and is based not only on the study of the element as it occurs in a separate form, but of every available compound. The series of impressions thus obtained are ultimately combined into an *ideal*, which in the chemist’s mind constitutes the “character” of the element, and it is such a series of ideals that he has before him when considering the periodic system. He is, in fact, to a great extent guided by instinct. But in the case of elements, as in that of individuals, the determination of character is often attended with very great difficulty, a true estimate being only slowly arrived at, and when at last such an estimate is formed, it can only be very partially expressed in words. It is therefore justifiable to say that imagination and even sentiment play an important part in chemistry, and that if too rigidly and narrowly interpreted, facts may become very misleading factors.

One of the greatest difficulties in the way of forming a correct estimate of the properties of an element arises from the extraordinary manner in which properties are dependent on molecular composition; the task is equivalent to that of studying individuals through observations of crowds in which they are barely distinguishable. Familiar instances are afforded by oxygen and ozone, and by **Properties and molecular composition.** ordinary yellow and red phosphorus. No two substances are more unlike in behaviour than are oxygen and ozone, yet both are composed of the same “stuff,” the difference being that the one has diatomic (O_2) and the other triatomic (O_3) molecules. Again, the inactivity of nitrogen, as we know it, is altogether

remarkable in view of the impression which a study of nitrogen compounds conveys that the element is a highly active one. An extreme instance is afforded by carbon. No conception of the properties of this element can be obtained by studying it in any of the forms in which it is ordinarily met with, and the reason is not far to seek. As ordinary amorphous carbon is converted by oxidation into mellitic acid, $C_6(CO_2H)_6$, a derivative of benzene, it may be assumed that it contains at least 12 atoms in its molecule; but mellitic acid contains a ring composed of 6 atoms of carbon—the benzene ring, and for the reason, among others, that there is an obvious tendency on the part of carbon to form such rings, it is not improbable that each of the six atoms associated with the ring in mellitic acid was originally present in the carbon in a benzene ring which underwent destruction during oxidation. On this assumption the carbon molecule contains at least 42 atoms of carbon. What is true of elements is equally true of compounds—especially of oxides. Thus, whereas carbon and silicon yield comparable chlorides of simple composition, CCl_4 and $SiCl_4$, their oxides are totally different, carbon dioxide being gaseous, whilst silicon dioxide is a non-volatile solid that fuses with difficulty. The difference is undoubtedly due to the fact that the molecule of the latter is complex, x in the formula $(SiO_2)_x$ having possibly a high value. Another striking illustration of the dependence of properties on molecular composition is afforded by the two oxides of nitrogen, NO_2 and N_2O_4 ; the former is an intensely coloured gas characterized by an absorption spectrum of extraordinary complexity, whereas the latter is a colourless crystalline solid. Although the force of such facts has long been recognized, they are by no means sufficiently brought under the notice of students. Even in the case of gases, although Avogadro's theorem is accepted as the basis of our system, its consequences are too often disregarded in the text-books, many of which are disfigured by the appearance of H, O, and N as symbols of hydrogen, oxygen, and nitrogen, for example. Canizzaro's striking Faraday lecture, delivered in 1872 (*Journ. Chem. Soc.* pp. 941-967), dealing specially with the application of Avogadro's theorem, may be consulted with advantage by all who wish to gain correct views on such a question.

Ultimately all peculiarities such as have been referred to must be traceable to peculiarities inherent in the elements; in order that this may be done, and that the extent to which properties depend on molecular composition may be ascertained, the determination of molecular weight becomes an operation of the first importance, and it is not to be forgotten that the determination of molecular weight is a necessary step in the determination of atomic weight. Very great improvements in the methods of determining gaseous densities have been effected in recent times, chiefly by Victor Meyer, and whereas formerly it was only possible to deal with gases, methods are now available for the determination of the molecular weights of liquids and of solids in solution. The form of apparatus introduced by Victor Meyer (in 1877) is known and in use everywhere. It consists of a cylindrical bulb attached to a long narrow stem, which is closed at the upper end by a stopper. Near this end a side tube is sealed on through which gas can escape and be collected. By surrounding the bulb and part of the stem with the vapour from a liquid of constant boiling-point, or by placing it in a furnace, the temperature may be raised to any desired point. The only limit is that imposed by the material of which the apparatus is constructed; if porcelain or platinum be used, observations can be conducted at very high temperatures. At the time of his death Meyer was engaged in attempts to construct vessels which would permit of experiments being made at tempera-

tures far higher than those which platinum will withstand. In using the apparatus, the bulb is heated to a constant temperature, which is easily ascertained by watching whether air—or whatever gas the apparatus may contain—escapes from the side tube; the stopper is then withdrawn, a weighed quantity of the substance to be examined is deftly introduced into the tube, and the stopper reinserted. When the substance reaches the bottom of the bulb it quickly volatilizes, and displaces the gas from the bulb; this is collected and measured. There is no need to notice the temperature. The gas collected is measured under the prevailing atmospheric conditions; its volume is that of the vapour derived from the substance, assuming this to have been gasified under atmospheric conditions.

By means of this apparatus, Victor Meyer, in conjunction with Carl Meyer, was led in 1879 to make the altogether unexpected discovery that chlorine has a much lower density at high than at low temperatures. The experiment was made by dropping a known weight of platinous chloride into the bulb; this underwent decomposition into solid platinum and gaseous chlorine. At temperatures between 1200° and 1500° the value obtained was only about two-thirds of that to be expected on the assumption that ordinary chlorine was dealt with. Crafts and Meier, who repeated the Meyers' experiments, using ordinary chlorine, did not confirm their results. But both parties were right. It is now generally admitted that when the halogens are strongly heated the ordinary diatomic molecules undergo dissociation into monatomic molecules, e.g.,

This change takes place comparatively readily in the case of iodine, much less easily in the case of bromine, and only to a very slight extent when ordinary gaseous chlorine is heated. When platinous chloride is strongly heated, however, the chlorine is initially separated from the compound in the monatomic state, and hence it is that much lower values are then obtained. The same is true of platinous bromide as compared with ordinary bromine. The result is one of great interest theoretically, and justifies the assumption often made that in the nascent state substances may exercise different and more powerful effects than they do ordinarily. Meyer found that the complex (tetra-atomic) molecules of phosphorus and arsenic also undergo simplification at a white heat—the values approaching those calculated for diatomic molecules. When zinc and bismuth are volatilized, they—like mercury and cadmium—afford monatomic molecules; thallium, however, yields diatomic molecules. Numerous attempts have been made to determine the vapour densities of the alkali metals, but unfortunately they attack both platinum and porcelain vessels, and it is difficult to place confidence in the results.

The "freezing-point" and "boiling-point" methods referred to later have been applied to a number of the (heavy) metals in the form of alloys or amalgams. The results seem to show that, in most cases, the liquid metal consists of monatomic molecules. Speaking generally, in fact, there seems to be a far greater tendency on the part of non-metals than of metals to form complex molecules. It is more than probable that many of the properties connected with, and indeed characteristic of, the true metallic state have their origin in this circumstance. It is also not unlikely that important variations in the properties of metals, such as are occasioned by the presence of small amounts of foreign substances, may be the outcome of changes in molecular structure. Osmond has made this assumption in the case of iron, for example, to explain the existence of hard and soft varieties, and it is

difficult to account for the extraordinary behaviour of iron in any other way.¹

Numerous experiments have been made by Victor Meyer and others to determine, with the aid of his apparatus, the molecular weight of metallic chlorides at high temperatures, such knowledge being of great importance in discussing the valency of metallic elements. The results as a whole favour the view that in many cases the chlorides have the simplest possible composition at high temperatures, whilst they undoubtedly form more complex molecules at temperatures near to their boiling-point; stannous chloride, for example, is represented by the formula SnCl_2 at high, but by Sn_2Cl_4 at low temperatures. The case of aluminium is of special interest. This element occurs below boron in the periodic system and therefore should behave as a triad, but, as shown by Deville many years ago, the vapour of aluminium chloride not far above its boiling-point would seem to consist of molecules of the formula Al_2Cl_6 (compare Crafts, *Trans. Chem. Soc.* 1900, p. 993). Determinations made at much higher temperatures, however, give lower values, and the conclusion that aluminium is really a triad metal is apparently confirmed by the observations first made by Odling and Buckton in 1865, and supported by later experiments (cf. Quincke, *Zeits. phys. Chem.* 1889, p. 164), that aluminium methide, even at a temperature only 10° above its boiling-point, has a vapour density 20 per cent. lower than the value corresponding to the formula $\text{Al}_2(\text{CH}_3)_6$, and that as the temperature is raised the density approaches to that required by the formula $\text{Al}(\text{CH}_3)_3$. But such inquiries need to be carried out in a much more systematic and exact manner than heretofore, especially now that a new field has been opened up by H. B. Baker's recent important observations, which show that ammonium and mercurous chlorides may be volatilized unchanged if only the presence of moisture be most scrupulously avoided; all previous observers had found that both undergo decomposition when volatilized (*Trans. Chem. Soc.* 1900, p. 646).

VALENCY.

The conception of valency, introduced into chemistry by Frankland in 1852, may be said to be the dominant principle on which our entire system of rational or constitutional formulæ is founded, and therefore the subject is one of the utmost importance. It may be defined as the doctrine of the functional activity of the elements, and includes the consideration not merely of the extent to which, but also of the manner and mode in which, an element or radicle enters into combination with others. The valency of an element is usually defined as merely its atom-fixing power relatively to that of hydrogen—elements being classed as *uni-, bi-, ter-, quadri-*valent, or as *monads, dyads, triads, tetrads*, according as their atoms unite with one, two, three, four atoms of hydrogen or their equivalent. In this form the conception is not only a narrow one, but a totally inadequate expression of the facts. Proof is not wanting that this is gradually being realized, and it may be hoped that ere long the complex character of the function will be more clearly recognized. The first step will then have been taken towards a truer appreciation of the phenomena. An admirable although brief summary of the historical development of the conception of valency is to be found in the lecture delivered by Professor Japp in memory of Kekulé (*Trans. Chem. Soc.* 1898, p. 97).

¹ A valuable summary of our knowledge of the metals, from the points of view referred to in this paragraph, by Mr. F. H. Neville, is to be found in the Report of the British Association for 1900. A table of "intermetallic" compounds is given in this Report which is of interest as bearing on intermetallic valency.

The view that has met with almost general acceptance is that put forward by Frankland, according to which, whilst each element exhibits a maximum valency, it may manifest one or more subordinate valencies, the affinities in abeyance in cases in which only the lower valency is manifest mutually satisfying each other. By a logical extension of this view elements have been divided into those of odd and those of even valency, and it has been held that all elements belong either to one or other of these classes; it will be shown later, however, that this is not justified in practice. Kekulé, whose services in this field rank with those of Frankland, maintained that valency could not vary. He considered that it was necessary always to make use of *monad* elements in determining valency, and moreover that the only compounds on which valid arguments could be based were those which could be volatilized without undergoing decomposition. In discussing this question Professor Japp goes so far as to say: "Of all the doctrines which we owe to Kekulé, that of fixed valency is probably the one that has met with least acceptance even among chemists of his own school. At the present day it is, so far as I am aware, without supporters." But he adds, "yet Kekulé held it to the last." Such a fact cannot be overlooked. That he went too far in asserting that valency could not vary is probably true, but the essential feature in his objection—that in many cases valency was over-estimated by the Frankland school—cannot be so easily disposed of. Kekulé, it is to be remembered, although not the originator of our system of formulæ expressive of structure, may yet fairly be said to have done so much to promote and extend their use that he is to be regarded as practically the father of modern structural chemistry. He saw clearly that structure is the determining factor to be taken into account in all such discussions, and hence it was that he would only allow *monad* elements to be used in determinations of valency. In objecting to the use of compounds such as ammonium chloride and phosphorus pentachloride as criteria of valency, Kekulé took a further step, the importance of which still remains unappreciated, by dividing compounds into two classes—*atomic* compounds and *molecular* compounds. In the former the components are held together by atomic affinities or true valencies; the latter are composed of atomic compounds held together by "molecular affinities." Views such as these have not proved acceptable, probably because chemists have been unwilling to base any distinction on stability, having in mind the great differences in stability met with among compounds, and also because they have been unwilling to believe in the existence of different orders of affinity. The discovery by Thorpe in 1875 of a highly stable phosphorus pentafluoride is undoubtedly supposed to have placed Kekulé's objection out of court.

The first difficulty that arises in determining the valency of an element is in the selection of a measure. In the case of elements capable of forming volatile hydrides an unexceptionable standard is at hand in hydrogen, but few come under this category. Hydrocarbon radicles such as methyl (CH_3) are so entirely comparable with hydrogen that they form an equally efficient standard, and as many elements form methides which do not furnish volatile hydrides, some assistance may be obtained by calling such radicles into requisition. But in cases to which these criteria are inapplicable the difficulty becomes very great; indeed, it is doubtful if a trustworthy standard can then be found. A difficulty of another order is met with in determining whether the atom-fixing power of an element is to be

Views of valency.

Difficulties of determination.

regarded as a constant or variable quantity—or perhaps it is better to say, in determining the maximum valency of an element. In substance this difficulty arises from the difficulty previously referred to of obtaining and applying a satisfactory standard of valency. A third, and perhaps the greatest difficulty of all arises from the circumstance that valency is a dependent variable, the degree in which it is manifest depending on the conditions under which the element is placed.

Apparently the only saturated molecules known to us at present, *i.e.*, molecules destitute of all power of exercising an external influence, are those of gases such as helium and argon. Even hydrogen is to some extent unsaturated, to judge from its behaviour towards the metals platinum and palladium. On account of its properties generally, however, and of the extreme difficulty with which it is compelled to assume the liquid state, it may be said to follow helium closely; consequently it may be supposed that the hydrogen atom is a strictly univalent atom, and that when it is associated either with itself or with another radicle its affinity becomes all but neutralized.

Tested by their power of combining either with hydrogen or methyl, the elements generally (in so far as these tests are applicable) may be resolved into the four groups of which the four hydrides HCl , H_2O , H_3N , H_4C are types. But, except in the last of these groups, the compounds produced are unsaturated. Hydrogen chloride and ammonia very readily liquefy in presence of water, in which they are intensely soluble; and water, considering its composition in comparison with that of hydrogen chloride and ammonia, and the fact that the analogous sulphur compound is gaseous and but slightly soluble in water, is altogether remarkable on account of its high boiling-point, its high capacity for heat, and its extraordinary power of dissolving oxygenated compounds generally and also chlorides, bromides and iodides. Apparently the only plausible—if not the only possible—interpretation of these peculiarities is that the three hydrides in question are all eminently unsaturated compounds. Assuming this to be the case, their attractive power may be regarded as exercised either (1) by the molecules as wholes; or (2) by their constituents independently, although not necessarily to equal extents; or (3) by one or other of the constituents.

The study of carbon compounds appears to justify the belief that in very many cases the activities which they display proceed rather from centres than from the molecules as wholes. Taking into account the estimate we are able to form on general grounds of the properties of hydrogen, on

the one hand, and on the other of elements such as chlorine, oxygen and nitrogen, it therefore seems probable that in the hydrides of these elements the attractive power is exercised entirely by the element which is associated with the hydrogen; that chlorine in hydrogen chloride, oxygen in water, and nitrogen in ammonia are each possessed of considerable residual affinity. It is to be noted that this residual affinity is by no means indiscriminately exercised. To put the point in conventional terms, whereas oxygen is prepared to behave as a dyad to all comers—to associate with them by means of its two affinities—fluorine alone being scorned, it is prepared to exhibit residual affinity only in presence of a select few; and most interesting of all, it seems to accord preferential treatment to itself and its near allies, the halogens. The behaviour of oxygen is all the more remarkable when it is contrasted with that of sulphur, the element with which it is most nearly allied; as tested by its power of combining with other substances, in comparison with water, sulphuretted hydrogen

is absolutely inert, and yet sulphur commonly ranks as an element of higher valency than oxygen. The peculiarity of oxygen referred to is specially manifest in the properties of ordinary water; the production of a substance so remarkable among hydrides, it may almost be said, can only be explained by the assumption that the residual affinity of the oxygen in the molecule of the dihydride OH_2 compels molecule to unite with molecule. To what extent complication proceeds we cannot yet say—the estimates vary; but of one thing we are certain, that placid as the fluid is in appearance, it must be pictured as at all times the seat of an extraordinary turmoil of dissociative changes. The view that oxygen is not to be regarded as capable of acting only as a dyad, but that it can also manifest a higher valency, has been definitely advocated in various quarters of late years—notably by Meldola, by Brühl in explanation of the properties of hydrogen peroxide, and by Collie (*cf. Trans. Chem. Soc.* 1899, p. 715); but in all these cases the oxygen has been pictured as acting as a tetrad, not merely as displaying residual affinity.

The argument which leads us to regard the oxygen in water and many other compounds as possessed of residual affinity would lead us also to conclude that this is also manifested—although in very different degrees—by the chlorine in hydrogen chloride and by the nitrogen in ammonia. The question then arises whether the union of these two compounds, when ammonium chloride is formed, takes place in such a way that the elements become re-distributed and separately centred around the nitrogen atom so that this acts as a pentad; or whether merely the residual affinity of each molecule comes into operation. This is the old historic question which was discussed by Kekulé and his contemporaries in the 'sixties, and decided by him in the latter sense, but which the general verdict of chemists has decided in favour of the doctrine of varying valency. In the interval numerous facts have come to light which bear on the problem although they do not solve it. Baker's recent observation, already referred to, may be held to meet Kekulé's objection that ammonium chloride cannot be volatilized unchanged; but as the compound at once breaks down in presence of a mere trace of water, it is a question whether the objection does not retain its force. An argument of real weight in favour of nitrogen being regarded as a true pentad in the ammonium compounds has been furnished by the discovery of derivatives of the hypothetical amine oxide H_3NO , corresponding with those which have long been known of the equally hypothetical phosphine oxide H_3PO ; their existence was first recognized by Wernick and Wolfenstein in 1898. Such compounds are formed on oxidizing tertiary amines—dimethylaniline, for example—by means of hydrogen peroxide, and by the action of methyl and ethyl iodides on hydroxylamine. They are highly basic substances, which combine directly with acids (*cf. Bamberger, Dunstan and Goulding, Trans. Chem. Soc.* 1899, p. 792).

On the assumption that the ammonium salts are molecular compounds, a quaternary ammonium derivative formed by uniting an amine Nabc with the iodide Id should differ from one produced from the amine Nabd and the iodide Ic . Experiments to test this assumption were made in 1875 by Meyer and Lecco, who on the one hand combined ethyldimethylamine with ethyl iodide, and on the other methyldiethylamine with methyl iodide; finding the products to have identical properties, they expressed the opinion that the ammonium derivatives were to be regarded as atomic compounds. Similar experiments made by Ladenburg at about the same date led to inconclusive

Saturated molecules.

Structure of ammonium compounds.

results. Lossen pointed out at the time that Meyer's results did not necessarily justify the interpretation he gave to them, inasmuch as the differences likely to arise in such a case might be so slight as to escape detection, particularly as crystallographic identity—on which Meyer and Lecco had placed special reliance—was, as a matter of fact, to be expected. At a later date, owing to the introduction of stereo-chemical considerations, the problem assumed a different aspect, and it became clear that the existence of isomeric asymmetric optically-active ammonium compounds was to be expected. The existence of such compounds was rendered probable, but not proved, by observations made by Le Bel in 1891, and has lately been established beyond question by Pope and Peachey (*Trans. Chem. Soc.* 1899, p. 1127), who have succeeded in resolving benzylphenylallylmethylammonium iodide into two powerfully optically-active isomerides. Although the problem is not solved by this important discovery, as it is conceivable that a molecular compound might also exist in isomeric optically-active forms, it is brought nearer solution, as a possible method of determining the structure of ammonium derivatives is at last placed in our hands. Yet it is evident that there may, and indeed will, be exceptional difficulty in arriving at a conclusion, and that the utmost caution must be used in interpreting even negative results, as the possibility must be foreseen of interchanges of position readily taking place within the molecule. Le Bel has laid particular emphasis on this, but from a point of view which is open to question.

In the case of compounds of non-metallic elements generally with halogens, the halogen is invariably displaced with great readiness by the use of alkalis. It is therefore highly remarkable that the compound $N(CH_3)_4I$, for example, should not be in the least affected by even the strongest caustic alkali, and that the halogen in such compounds behaves much as does that in alkylic haloids. This would seem to be a strong argument in favour of the view that the halogen is not simply associated with the nitrogen, but retained in combination with the hydrocarbon radicle. An even stronger case may be based on the similar behaviour of the phosphonium haloids, seeing that the compounds of phosphorus with halogens are so readily attacked even by water. It may be, however, that it is an effective answer to this argument to say that such behaviour affords proof of the error of the current view which asserts that when an alkali acts on ammonium haloids the halogen is attacked by the metal; in reality hydrogen is attacked by hydroxyl, the halogen only indirectly "falling a victim" to the metal, so that in the absence of hydrogen there can be little or no action. The case is one which well illustrates the difficulty of interpreting facts.

A class of facts which more than any other favours the view that the ammonium derivatives are molecular compounds may now be referred to. The basic qualities of ammonia, it is well known, are invariably diminished by the introduction of other radicles in place of hydrogen, and the extraordinary variations in basicity manifest amongst its derivatives cannot fail to arrest attention. Aniline, for example, is a very weak base in comparison with ammonia. But the chloranilines are still weaker, trichloraniline being so feeble that although soluble in acids it is precipitated on adding water. A more remarkable case is that of phenylhydrazine, $C_6H_5.NH.NH_2$, which yields only monacid salts; and hydrazine itself, $H_2N.NH_2$, although capable of forming diacid salts, has a marked tendency to combine with only a single equivalent of acid.

A large number of compounds are now known in which several nitrogen atoms are united in a ring, frequently in

conjunction with carbon. The nitrogen atoms seem to be united within the ring, on the one side by one and on the other by two affinities, so that the three affinities are entirely engaged within the ring. It is remarkable that the nitrogen in such compounds is in many cases entirely destitute of basic properties, and in fact inactive to an extraordinary degree. The same may be said of the nitrogen in compounds such as azobenzene, as the few compounds these form with acids are decomposed by water. But the most striking example of inactivity is afforded by the remarkable compound diazoimide, $N_2.NH$ —which may or may not have a ring structure; not only is this compound destitute of basic properties, but it actually behaves as a weak acid.

Therefore it cannot be asserted that nitrogen is a "basic" element. It is basic, as a rule, only in the *aminic* condition; the "ammonium function" is a strictly dependent function and highly discriminative.

The determination of the valency of the halogen elements is of primary importance, as we are practically forced to rely upon them as standards in many cases.

They commonly rank as well-defined monads, but as it is clear that iodine may exercise triadic functions, the remaining halogens can scarcely be denied the rank of potential triads. The question to be settled is whether any effects they may produce beyond the functions of a true monad are to be ascribed to residual affinity, or whether they are actual triads. At present the evidence is inferential, as there are no valid methods available of determining the structure of the compounds coming under consideration—for example, phosphorus pentachloride and the double chlorides generally. In all such instances we have to deal with at least two unknowns. Chemists have long been in the habit of dividing double chlorides into two classes—one comprising mere "double salts," of which very little proper notice was taken; the other compounds of a somewhat higher order of stability, such as the platinichlorides and aurichlorides, which have been regarded by many as atomic compounds, and in conjunction with compounds such as OsO_4 have been quoted as proof that platinum may function as an octad. Obviously, in the present state of our knowledge, the only fact of which they afford proof is that chlorides may combine. The supposition that the constituents in double chlorides generally may be held together through the agency of the chlorine atoms is one which cannot be dismissed from consideration; we do not hesitate to explain the formation of double cyanides, which are analogous compounds, by such an assumption, and, moreover, the existence of compounds such as the chlorates and perchlorates, and the extraordinary inertness of a part of the halogen in some of the cobaltamine compounds, almost compel belief in the existence of stable rings containing halogen atoms in which the halogen acts as a linking element. The application of this view to fluorine is of particular importance. There can be no question that this element is possessed of residual affinity in a far higher degree than any of the allied elements. The vapour of hydrogen fluoride near to its boiling-point (19°) consists of complex molecules (Mallet), which, as Thorpe and Hambly have shown, are only completely resolved into simple molecules at a temperature near to the boiling-point of water (*Trans. Chem. Soc.* 1889, p. 163). Double fluorides of remarkable stability are formed with exceptional ease. The properties of some of these are worthy of special consideration—notably hydrogen silicon fluoride, a compound analogous in composition to hydrochloroplatinic acid. In consequence of its relation to carbon the valency of silicon may be regarded as established. If silicon be a tetrad, we are, however, almost compelled to assume that in hydrofluosilicic

Valency
of the
halogens.

acid two molecules of hydrogen fluoride are associated with the molecule of silicon tetrafluoride through the agency of fluorine atoms; and it is worth while noticing that the stability of silicon tetrafluoride in presence of water is increased in a remarkable manner through its association with hydrogen fluoride. In view of these considerations, it is impossible to accept phosphorus pentafluoride as proof that phosphorus is a pentad. The still more remarkable compound sulphur hexafluoride, a gas which is not acted upon even by potash, recently discovered by Moissan (*C. R.* 1900, 130, p. 865), in like manner cannot be regarded as proof that sulphur is a hexad. It may almost be said that its extraordinary inertness is only compatible with the view that the sulphur and fluorine atoms form a closed chain or ring.

Sulphur is commonly supposed to be capable of acting not only as a dyad, as in sulphuretted hydrogen, but also as a tetrad on the evidence afforded by the sulphonium compounds, and as a hexad in consequence of the existence of the oxide SO_3 . The sulphonium compounds are the sulphur analogues of the quaternary ammonium compounds, and according as the latter are regarded as atomic or molecular compounds, so must the former be equally so regarded. Most important observations bearing on this problem have been recently made by Pope and Peachey (*Trans. Chem. Soc.* 1900, p. 1072), who have shown that it is possible to obtain the sulphonium compound which is formed on combining methylethyl sulphide with bromacetic acid in isomeric optically-active forms—a discovery which appears to prove that sulphur can function as a tetrad much as carbon does. Inasmuch as we are at present unable to determine the structure of sulphur trioxide, its existence cannot be accepted as proof that sulphur functions as a hexad. As bearing on this subject, the following striking passage may be quoted from Mendeléeff's Faraday lecture (p. 653):—

The periodic law has demonstrated that the maximum extent to which different non-metals enter into combination with oxygen is determined by the extent to which they combine with hydrogen, and that the sum of the number of equivalents of both must be equal to 8. Thus chlorine which combines with 1 atom, or 1 equivalent of hydrogen, cannot fix more than 7 equivalents of oxygen, giving Cl_2O_7 ; while sulphur, which fixes 2 equivalents of hydrogen, cannot combine with more than 6 equivalents, or 3 atoms of oxygen. It thus becomes evident that we cannot recognize as a fundamental property of the elements the atomic valencies deduced from their hydrides; and that we must modify, to a certain extent, the theory of atomicity if we desire to raise it to the dignity of a general principle capable of affording an insight into the constitution of all compound molecules. In other words, it is only to carbon, which is quadrivalent with regard both to oxygen and hydrogen, that we can apply the theory of constant valency and of bonds, by means of which so many still endeavour to explain the structure of compound molecules.

Mendeléeff in these remarks altogether leaves out of account the possibility that the oxygen atoms in the oxides are not always separately attached, and apparently he does so advisedly; yet the properties of ruthenium and osmium tetroxide and of the perchlorates, for example, almost necessitate such an admission. As an empirical generalization, the limit he fixes to oxidation is of remarkable interest and importance, and it is noteworthy, bearing in mind the resemblance fluorine bears to oxygen, that the sum of the equivalents in the highest fluoride is the same as in the highest oxide of sulphur. May it be that the same "law" applies to the oxides and fluorides of non-metallic elements?

It remains to point out that an argument of great weight in favour of the view that iodine functions as a triad is supplied by Victor Meyer's discovery in 1889 of the iodonium compounds, which apparently bear the same relation to iodine that the sulphonium compounds bear to sulphur,

and the ammonium compounds to nitrogen. Diphenyliodonium hydroxide, $\text{I} \begin{Bmatrix} \text{C}_6\text{H}_5 \\ \text{C}_6\text{H}_5 \\ \text{OH} \end{Bmatrix}$, is readily soluble in water,

forming a strongly alkaline solution. On adding potassium iodide to a solution of the base, the corresponding iodide is thrown down as a yellow precipitate closely resembling lead iodide. When heated, this iodide is very readily converted into iodobenzene, heat being developed. It is very difficult, indeed impossible, to apply the molecular compound hypothesis to such substances.

From the above sketch, in which only a few of the main points are touched on, it will be obvious that the problems to be solved are many and difficult. At present we have little but shadowy impressions to guide us; certain dogmas are taught in the schools, and these influence our judgment, if indeed we can be said to exercise any judgment in the matter. It is time the facts were more carefully correlated, and that systematic inquiries were instituted, as the determination of the valency of elements may be regarded as in a measure a determination of their structure. Fortunately a new beginning has been made in this direction by the recent extension of stereo-chemical conceptions to elements other than carbon; indeed, the facts brought to light are already sufficient to carry the problem a stage farther. As sulphur is found to yield optically-active sulphonium derivatives, and therefore to resemble carbon, it must be supposed that this element can act as a tetrad; and on similar grounds the nitrogen in the ammonium compounds must be allowed to rank as a pentad. But seeing that the formation both of ammonium and of sulphonium compounds takes place only within very narrow limits, and that, as previously pointed out, nitrogen is basic only under special conditions, it is clear that in the case of the four affinities of the sulphur and of the five of the nitrogen atom, two of the former and three of the latter differ greatly from the remainder, and it would seem both in magnitude and character. A similar argument applies to other elements the valency of which apparently varies. If such a conclusion be warranted, the problem after all remains very much what it was when the question was raised by Kekulé.

In recent years the attempt has been made—largely on the authority of Helmholtz (Faraday lecture, *Trans. Chem. Soc.* 1881, p. 277)—to give a more precise form to the conception of valency, by regarding it from an electrical standpoint—by assuming that definite indivisible charges of electricity, positive or negative, are associated with the atoms of matter, the number of charges corresponding with the number of units of affinity manifested by the atom, i.e., its valency. These charges are supposed to condition the formation of compounds, the atoms clinging to the charges, and the charges of opposite sign clinging to each other. This hypothesis is the basis of the ionic dissociation hypothesis, to be discussed later, which has become so popular in recent years. But the new view is but a paraphrase of the old view. If the nitrogen atom, for example, carry five unit charges, it is difficult to understand why two of them should so often remain in abeyance; on the other hand, if only three charges are associated with the atom, it becomes necessary to admit that the unit charge may be divided—a supposition which is contrary to the hypothesis. The hypothesis does not take into account the fact that the *fundamental* molecules, even of so-called atomic compounds—water molecules, for example,—rarely, if ever, behave as saturated, but more or less readily and firmly unite with other molecules to form molecular aggregates. Helmholtz, seeing the difficulty, said that he did not suppose that the existence of other molecular forces, working directly from atom to atom,

*Helmholtz
on valency.*

was to be excluded. But, apart from the fact that a hypothesis which requires so much helping out is of little practical use from the chemist's point of view, it seems necessary to admit that whatever may be the nature of chemical affinity, the same forces are active throughout—that what sometimes is termed residual affinity is of the nature of ordinary affinity, and that the difference is in quantity rather than in quality.

STRUCTURE AND ISOMERISM.

The study of structure is correlative with that of valency; in fact they are strictly interdependent studies, our views on valency being founded on the success with which we are able to apply them in deducing satisfactory structural formulæ. Of late years chemists have devoted their attention almost exclusively to the investigation of carbon compounds, to such an extent as even to provoke the complaint that they are guilty of unduly neglecting the study of other elements. But even if true there would be slight reason to deplore this. In consequence of the extraordinary activity displayed by workers in organic chemistry, our knowledge of carbon compounds has reached a high degree of development, and materials are fast being accumulated from which it will be possible ultimately to deduce precise conclusions as to the manner in which properties are dependent on structure; since it is now clear that the properties of the carbon compounds are primarily functions of their structure, and only in a minor degree dependent on their composition. The number of carbon compounds already known is legion, and there are still infinite possibilities before us. The technique of the subject is also highly developed, and new combinations are readily effected; it is easy, therefore, as a rule, to test any hypothesis that may be framed, and ultimately to secure evidence which is sufficient either to prove or disprove its accuracy. But in the case of all other elements a far less plastic material is dealt with, and the field of investigation is a comparatively narrow one; it is therefore less easy to avoid a dogmatic construction of the evidence. The difficulty of dealing even with such simple compounds as the chlorides has already been referred to. To deal with the oxides is still more difficult. Indeed, there can be little doubt that our knowledge of the structure of inorganic compounds generally is far less definite than is often supposed to be the case, and that much is taught in the text-books for which there is no justification. To take two examples, the alkalis and acids. Caustic soda and potash are now invariably represented by the formulæ NaOH , KOH , but there is no evidence which can be called evidence that these are correct: they are but an expression of a prevailing fashion, being used because the view is held that the relationship of the alkalis to water is—or ought to be—that represented by such formulæ, and because of the existence of alcohols. It is, at least, as probable that they are but hydrates of the oxides, e.g., $\text{Na}_2\text{O} \cdot \text{OH}_2$. Again, sulphuric acid is always represented as $\text{SO}_3(\text{OH})_2$; the arguments on which this formula rests, however, are equally applicable to the old Berzelian formula, $\text{SO}_3 \cdot \text{OH}_2$. The statement commonly made that by the action of phosphorus pentachloride sulphuric acid is first converted into SO_3HCl and then into SO_2Cl_2 , and that thereby proof is obtained of the existence of two OH groups in the acid, to begin with, is half wrong, as the second product is pyrosulphuryl chloride, $\text{S}_2\text{O}_5\text{Cl}_2$, not sulphuryl chloride, SO_2Cl_2 . Moreover, the production of the compound SO_3HCl cannot be held to prove that the acid contains the hydroxyl group; as this compound is readily obtained by combining sulphuric anhydride with hydrogen chloride, its production may be a consequence of the removal of

“water” from the acid by the action of the pentachloride, and the consequent union of the residual oxide with hydrogen chloride formed by the interaction of water and phosphorus pentachloride. It is not impossible that SO_3HCl is a molecular compound, and not an acid chloride, as the corresponding compound formed by combining ethyl chloride with sulphuric anhydride behaves as a mild form of the latter, i.e., as a sulphonating agent, not as an acid chloride. Lastly, it may be pointed out that the properties of sulphuryl chloride, SO_2Cl_2 , are altogether peculiar, and not those of an acid chloride; as a rule it acts as a chlorinating agent, consequently its conversion into sulphuric acid by water affords no proof of the constitution of the acid. It may well be that water is initially “chlorinated” by it, and that in consequence the SO_2 group becomes oxidized to SO_3 , which then unites with water, forming sulphuric acid.

It is unnecessary to pursue such arguments farther. It is sufficient to point out that in many cases our views of structure are of the nature of preconceived opinions, being based on a too narrow interpretation of the facts. It is time that students were made more fully aware of the precise value of the formulæ they are in the habit of using, as it is essential that the chemist should preserve a free and balanced judgment. The dogmatic treatment too frequently accorded to our subject is absolutely subversive of true scientific method and serves to retard progress.

Passing to carbon compounds, the greatest advance to be noted in our knowledge of structure is that due to the introduction of geometrical conceptions by van't Hoff and Le Bel independently in 1874, *Stereo-isomerism*, which has given rise to the now well-known doctrines of stereoisomerism, i.e., isomerism due to differences in the arrangement of the atoms in space. In this doctrine it is assumed that the molecule is a stable system of material points, and that the radicles associated with a carbon atom occupy fixed positions; it is further supposed that they are situated in the manner represented by taking the tetrahedron as the model of the carbon atom and grouping the four radicles with which it is associated in all saturated compounds at the four corners of the model—of which the carbon atom may be supposed to occupy the centre of gravity. On this assumption, a compound CR'_4 can exist in only one form, so long as any two of the radicles are identical, but when all four are unlike two forms are possible. The models of these two forms are two tetrahedra which cannot be superposed but bear to each other the relation of right to left hand; the two forms are therefore said to be *enantiomorphously* related, and as neither planes nor centre of symmetry can exist in such forms, the carbon atom which is their central feature is termed an *asymmetric* carbon atom.

Of greatest importance is the explanation this doctrine affords of cases of isomerism such as that met with in the two tartaric acids, the separation of which from racemic acid was Pasteur's great achievement and the one which first gave him fame. Pasteur, indeed, in discovering the relationship of these acids and their possible structure, clearly foreshadowed the hypothesis (cf. Frankland, Pasteur Memorial Lecture, *Trans. Chem. Soc.* 1897, p. 691). It is now known that in all cases in which carbon compounds manifest the power in solution of rotating the plane of polarized light—as do the two tartaric acids—they contain one or more asymmetric carbon atoms. On the other hand, it has been shown that in the case of a large number of compounds represented by a formula containing an asymmetric carbon atom, but initially produced in an optically-inactive form, it is possible, by methods such as were introduced by Pasteur, to resolve the inactive product into two isomerides of equal but opposite optical

activity.¹ The formation of optically-active nitrogen compounds foreseen by Le Bel and established by Pope and Peachey, and the still more recent discovery of such compounds derived from the metal tin and from sulphur by these latter chemists (*Proc. Chem. Soc.* 1900, p. 42; *Trans. Chem. Soc.* 1900, p. 1072), have afforded proof that the doctrine of asymmetry may be extended to elements other than carbon, and it may be confidently expected that these are not the only cases in which it will be found to be applicable. The extraordinary value of the doctrine of asymmetry will be appreciated when its application to compounds such as those of the sugar group—which are all optically-active—is understood, especially when it is borne in mind that prior to the introduction of the theory it was impossible to explain in any satisfactory manner several cases of isomerism occurring in this group, and this too at a time when the number of compounds included in the group was far smaller than is now the case.

Among the many investigations into minute structure carried out in recent years, none ranks higher in importance or is more full of interest than that of E. Fischer on the sugars, in the course of which he has been led not only to synthesize glucose,

Isomeric Glucoses.

but also to prepare a large number of new isomeric hexoses, and to place their constitution beyond all doubt with the aid of the van't Hoff-Le Bel theory. As a monument of experimental skill the inquiry stands unrivalled, and no better illustration can be given of the perfection to which analytic and synthetic methods have been carried by organic chemists. The carbohydrates—a class of compounds of supreme importance on account of the part they play as structural and food materials in the economy of plants and animals—stand in close genetic relationship, and glucose (dextrose) being the end term of the series, and the product into which most of the more complex members of the group are resolved by hydrolysis, has long attracted the attention of chemists. At an early date it was discovered that both glucose and fructose (lævulose)—the two isomeric hexoses of the formula $C_6H_{12}O_6$ which are formed on hydrolysing cane sugar—are derivatives of the paraffin hydrocarbon normal hexane, C_6H_{14} , in which the six carbon atoms are known to be arranged just as the links are in a simple branchless chain. Both yield mannitol, $C_6H_{14}O_6$, a well-known natural product, on reduction. Mannitol is proved to be a hexhydric alcohol, $C_6H_5(OH)_6$, by its conversion into a hexanitrile, and as it is a highly stable compound (alcohols containing several hydroxyl groups attached to one carbon atom being unstable), there can be no doubt that the six atoms of oxygen which it contains, and which were originally present in the hexoses, are each separately associated with a carbon atom. When mannitol is distilled with a solution of hydrogen iodide, it is converted into hexylic iodide, $C_6H_{13}I$, which on further reduction yields the hydrocarbon, normal hexane. Glucose behaves as an aldehyde on oxidation, being converted into monobasic gluconic acid, so that one of the oxygen atoms is present as COH; consequently its formula may be written:—

The behaviour of fructose, on the other hand, is that of a ketone rather than that of an aldehyde; but two ketoses can be derived from an alcohol such as mannitol:—

It was not until 1885 that Kiliani succeeded in discrimi-

nating between these two formulæ, as well as in proving the correctness of the formula commonly assigned to glucose. The method he adopted consisted in, as it were, attaching a label to the CO group, and subsequently determining the position of the label. The label used was carboxyl, CO_2H , the group characteristic of acids, which was attached by affixing hydrogen cyanide to the CO group and then hydrolysing the cyanogen group:—

To determine the position of the carboxyl group the acids were then reduced, *i.e.*, the OH groups were displaced by hydrogen by means of hydrogen iodide, and they were thus converted into acids of the acetic series of the formula $C_7H_{14}O_2$ (heptylic acids). The acid from glucose proved to be the normal acid, and that from fructose butylmethylacetic acid, proving that the CO group in glucose was at the end of the chain, but that it formed, as it were, the second link in fructose:—

E. Fischer's entry on the scene dates from the year 1884, when he made the all-important discovery of phenylhydrazine, $C_6H_5.NH.NH_2$ or $Ph.NH.NH_2$. Although not the Rosetta stone which enabled him to decipher the minute structure of glucose and its congeners, this compound made possible for the first time the separation and identification of such compounds. Its use and value depend on the fact that keto-compounds generally are converted by it into *hydrazones*, which are usually well-defined crystalline substances:—

In the case of the hexoses, which are readily oxidized, the action, however, usually proceeds a stage farther, an *osazone* being formed by the oxidation, at the expense of the phenylhydrazine, of the "alcohol" group contiguous to the hydrazone-group, and the action on the new keto-compound thus produced of another molecule of phenylhydrazine; thus:—

The first of these formulæ represents the intermediate product formed from glucosehydrazone; No. II., that derived in like manner from fructosehydrazone; No. III. represents *glucosazone*, the final product whether glucose or fructose be used. The production of one and the same substance from the two hexoses is a result of peculiar importance as bearing on their structure, for it will be obvious that it affords the proof that a greater part—the four upper tiers, as it were—of their molecules is identically constituted.

On reference to the formula of glucose, it will be noticed

¹ For a full discussion of the doctrine and its consequences see van't Hoff's *Arrangement of Atoms in Space*. English translation by Eilart (Longmans, Green, and Co.).

that each of the four carbon atoms in the four $\text{CH}(\text{OH})$ groups is combined with four different radicles, so that there are four *asymmetric* carbon atoms in the formula. The number of modifications of an asymmetric compound—which is not itself symmetric—is 2^n , where n is the number of such carbon atoms; it is therefore to be supposed that 16 isomeric aldohexoses of the formula $\text{C}_6\text{H}_{12}\text{O}_6$ can exist. At the time Fischer began to work at the group only one was known besides glucose—galactose, which is obtained together with glucose on hydrolysing milk sugar. In 1894, when Fischer summarized the results of his work, he was able to speak of no fewer than eleven of the sixteen, and to define their structure precisely.

The next chapter of discovery to be considered relates to the synthesis of fructose and glucose, one of the most memorable achievements in chemistry in view of the part these play in plant economy. Butlerow, a distinguished Russian chemist, as far back as 1861, by digesting trioxymethylene, the solid polymeride of formic aldehyde, H_2CO , with lime, obtained a sugar-like substance, methylenitan, to which he assigned the formula $\text{C}_7\text{H}_{14}\text{O}_6$. Attention was specially directed to this research by Baeyer, in 1879, in the course of the celebrated paper in which

he discussed the formation of sugar in the plant. **Synthesis of fructose.** Baeyer maintained that formic aldehyde must be regarded as the primary product formed by the reduction of carbon dioxide in the plant, and as that from which glucose and similar substances are gradually built up. Owing to the difficulty of preparing formic aldehyde, the subject was left untouched for a considerable time until Löw, in 1886, greatly improved the method of producing the aldehyde—so much so, that it is now manufactured on a very large scale, and used in making certain aniline dyes and also as an antiseptic agent. Löw carefully repeated Butlerow's work, and obtained results which he regarded as confirmatory of Baeyer's suggestion; he described the product as a sweet, unfermentable syrup, of the formula $\text{C}_6\text{H}_{12}\text{O}_6$, and termed it *formose*. Löw, however, assigned the formula $\text{C}_{18}\text{H}_{22}\text{N}_4\text{O}_8$ to the osazone prepared from this formose, whereas that of glucosazone is $\text{C}_{18}\text{H}_{22}\text{N}_4\text{O}_4$. To explain this discrepancy, E. Fischer repeated Butlerow's and Löw's experiments, and arrived at the conclusion that the main product was in reality a compound of the same composition as glucose, though resembling it only distantly in properties, for which formose was a very suitable name. At the same time he discovered in the product a relatively small proportion of an isomeric substance which was subsequently identified as the α -acrose to be referred to later. Meanwhile, Löw had continued his experiments, and by using magnesia in place of lime, had obtained a fermentable product which he named methose. In Fischer's hands this also proved to be α -acrose. This substance was discovered by Fischer and Tafel in 1887, and was first obtained by cautiously adding baryta to a solution of acrolein dibromide, prepared by combining the aldehyde acrolein, $\text{CH}_2\text{:CH.CO.H}$, with bromine. A better method of producing it, subsequently discovered, is to oxidize ordinary glycerol by means of bromine and alkali, and to subject the product to the action of very dilute alkali at 0° . Glycerol yields two compounds when oxidized—the corresponding aldehyde and the corresponding ketone, and apparently α -acrose is formed from these by "condensation" in the manner indicated in the equation:—

It should be mentioned, however, that it is only one of several products.

The osazone prepared from α -acrose was found to

resemble most closely that obtained from glucose and fructose, acrosazone differing only from glucosazone in being optically inactive. This observation showed that a most important step had been taken towards synthesizing the natural hexoses, as it justified the conclusion that α -acrose was merely the inactive form of either glucose or fructose—a view which was ultimately confirmed, but only after years of work. In the first place, it was necessary to reproduce the hexose from the osazone, the form in which alone it can be isolated from the crude synthetic product. Ultimately it was found that the action of phenylhydrazine on the hexoses could be reversed by means of muriatic acid, the group N.NHPh being thereby removed and displaced by oxygen, giving rise to an *osone* or *onal*—a compound combining in itself the properties of aldehyde and ketone, which on reduction by means of zinc dust and acetic acid is converted into a ketose; thus—

The compound prepared from acrosazone was found to have the properties of fructose, to be fermentable by yeast, to give lævulinic acid when boiled with muriatic acid, and to be converted by the action of sodium amalgam into α -acritol, a substance indistinguishable from mannitol except by its inactivity toward polarized light. As illustrating the difficulties met with in the research, it may be mentioned that starting from a kilogram of glycerol, only 0.2 gram of α -acritol could be obtained, in consequence of the number of the operations and the bad yields afforded by some of them. The character of α -acritol was ultimately deciphered by a method of indirect approach. Prior to Fischer's investigations, the attempt had often been made to reconvert mannitol and the isomeric alcohol dulcitol—which, besides being a natural product like mannitol, is formed on reducing galactose from milk sugar—into sugars by subjecting them to oxidation, but the results obtained were inconclusive owing to the difficulties met with in isolating the products. It was here that phenylhydrazine again proved to be an invaluable agent. With its aid Fischer and Hirschberger were able to show in 1887 that when mannitol is oxidized by means of nitric acid, it yields, besides fructose, an isomeride of glucose, mannose, which is the true aldehyde of mannitol, glucose belonging to a stereoisomeric series. Mannose and glucose are, however, most intimately related, as both ultimately yield glucosazone when subjected to the action of phenylhydrazine; hence it follows that they differ only in respect of the first asymmetric carbon atom above the COH group.

The investigation was assisted by the discovery made at this stage that mannose, the existence of which had so long lain hidden, was easily procurable from natural sources—Tollens and Gans obtaining it by hydrolysing salep mucilage, and Reis from so-called reserve cellulose, vegetable ivory turnings being a particularly suitable material from which to prepare it. On oxidation, mannose, like glucose, yields a monobasic acid—mannonic acid, which is a stereoisomeride of gluconic acid. When the aqueous solution of this acid is evaporated, the acid loses the elements of a molecule of water and is converted into a lactone, $\text{C}_6\text{H}_{10}\text{O}_6$, which crystallizes well. Now it had been observed by Kiliani that when arabinose—a sugar belonging to the pentose group, *i.e.*, one containing

five atoms of carbon—is combined with hydrogen cyanide, and the cyanide is hydrolysed, an acid isomeric with ordinary gluconic acid is obtained, and Kiliani had prepared from this acid the corresponding lactone. Kiliani's lactone and that obtained from mannonic acid were found by Fischer to be extraordinarily similar, but to differ in optical activity; by mixing the two lactones in equal proportions he obtained an optically-inactive product.

The final step was taken at this stage. It was found that the lactones referred to could all be converted into corresponding sugars by combining them with hydrogen by means of sodium amalgam, the mannolactone giving ordinary mannose, the isomeric lactone an isomeric mannose of equal but opposite activity, and the inactive lactone an inactive mannose. Corresponding mannitols were obtained by subjecting these aldoses to further reduction, and it was found that the inactive mannitol was identical with α -acritol. Hence it followed that the α -acrose separated from acrosazone was an inactive mixture of ordinary fructose with an isomeride of equal but opposite rotatory power. A separation was effected by destroying the ordinary fructose by fermentation with beer yeast, and then adding phenylhydrazine. An osazone was thus obtained which was the stereoisomeride of glucosazone prepared from ordinary fructose.

Although fructose had been obtained, it yet remained to prepare glucose. Bearing in mind the relation of mannose to glucose, it was to be expected that the one would be convertible into the other, but it could be foreseen that owing to their instability it would be difficult in practice to effect the conversion. Fischer, therefore, preferred to attempt to convert the corresponding monobasic acids into each other, as these were more stable, and Pasteur's researches already provided a method, viz., that used in preparing *lævotartaric* acid from ordinary *dextrotartaric* acid. He soon found that ordinary gluconic acid could be obtained from mannonic acid, and *vice versâ*, by heating their solutions with quinoline under pressure at 140° . The final step in solving the problem was then easily taken by converting ordinary gluconic acid into its lactone and reducing this latter.

Having thus succeeded in preparing substances identical with natural dextrose and *lævulose* entirely by artificial means, and starting from formic aldehyde—which can itself be produced from carbon dioxide, the material from which the plant derives its carbon—Fischer devoted his attention to the preparation of other stereoisomerides of glucose in order to obtain the data necessary to determine the exact configuration of the individual compounds. To understand his methods, it is necessary to bear in mind the manner in which the sixteen possible hexaldoses are structurally related. An asymmetric carbon system in which the four radicles attached to the carbon atom are arranged in a given order—say clockwise—may be termed a positive (+), and one in which they are arranged counter-clockwise a negative (−) system. When there are two such systems in a compound, four different arrangements are possible, provided the compound as a whole be asymmetric, viz.—

But if, as in the case of tartaric acid,

the compound is symmetric, being composed of two like systems, two of the four forms (those included in brackets) are identical, and the number of stereoisomerides is reduced to three; moreover, in this latter case only two of the forms will manifest optical activity, the third being

inactive, as it consists of two equal systems of opposite sign. In the case of the hexaldoses, which are all represented by unsymmetrical formulæ, symmetry is produced when the terminal groups become identical, as in the formation either of the corresponding hexhydric alcohol or of the corresponding tetrahydric di-acid:—

Consequently, whereas there are sixteen possible hexaldoses, there are only ten corresponding hexhydric alcohols and ten di-acids. In the following table the possible configuration of the four asymmetric systems are arranged so as to indicate the pairs of forms (5 11, 6 12, etc.) which give rise to one and the same substance when the molecule becomes symmetrical.

				11	12	13	14	15	16
				+	+	+	+	+	−
				+	+	+	−	−	+
				+	−	−	+	−	−
				−	+	−	−	−	−
+	+	−	−	−	+	−	−	−	−
+	−	+	−	+	−	−	+	−	−
+	−	+	−	+	+	+	−	−	+
+	+	−	−	+	+	+	+	+	−
1	2	3	4	5	6	7	8	9	10

Besides proving that the hexaldoses can be reproduced by reducing the lactones formed from the manobasic acids into which they are first converted by oxidation, Fischer has shown that it is possible to effect a similar reversal even in the case of the dibasic acids which are formed by continuing the oxidation. This discovery is of fundamental importance, as it gives a means of dealing, as it were, with both extremities of the molecule, and even of reversing the positions of the terminal groups in the hexaldoses. Taking the case of the saccharic acid, $\text{CO}_2\text{H}.\text{[CH}(\text{OH})]_4.\text{CO}_2\text{H}$, formed on oxidizing ordinary glucose, if the configuration be one of those represented under 1, 2, 3, or 4 in the above table, it must be a matter of indifference which of the two CO_2H groups is reduced to $\text{CH}_2(\text{OH})$ and which to COH —the result will be the same; but not so in any other case. Experiment has shown that the hexaldose obtained from ordinary saccharic acid is not glucose, but an isomeride now known as gulose. The optical isomeride of this gulose is obtained by making use of the gluconic acid which is the optical isomeride of that prepared from ordinary glucose. The importance of such a result is obvious; not only is the series extended, but it is placed beyond question that configurations 1–4 do not occur in either glucose or gulose, and in view of the simple relation which mannose bears to glucose, and seeing that the difference resides in the asymmetric system adjoining the COH group, it becomes possible to establish the configuration of glucose, gulose and mannose.

Since d-glucose¹ and d-gulose both yield d-saccharic

¹ To distinguish the isomerides of opposite optical activity, it is usual to prefix the letters d- and l-, but these are used only to indicate the genetic relationship, and not the character of the optical activity; ordinary fructose, for example, being represented as d-fructose—although it exercises a *lævorotatory* power—because it is derived from d-glucose.

acid on oxidation, the configuration in this and the corresponding l-acid must be sought from among those numbered 5-10 in the above table. Nos. 7 and 8 can be at once ruled out, however, as acids so constituted would be optically inactive and the saccharic acids are active. If the configuration of d-saccharic acid were given by either 6 or 10, bearing in mind the relation of mannose to glucose, it would then be necessary to represent d-mannosaccharic acid by either 7 or 8—as the forms 6 and 10 pass into 7 and 8 on changing the sign of a terminal group; but this cannot be done as mannosaccharic acid is optically active. Nos. 6 and 10 must, in consequence, also be ruled out. No. 5, therefore, represents the configuration of one of the saccharic acids, and No. 9 that of the isomeride of equal opposite rotatory power. As there is no means of distinguishing between the configuration of a dextro- and lævo-modification, an arbitrary assumption must be made. No. 5 may therefore be assigned to the d- and No. 9 to the l-acid. It then follows that d-mannose is represented by No. 1, and l-mannose by No. 4, as mannose is produced by reversing the sign of the asymmetric system adjoining the terminal COH group.

It remains to distinguish between 5 and 11, 9 and 15 as representing glucose and gulose. To settle this point it is necessary to consider the configuration of the isomeric pentoses—arabinose and xylose—from which they may be prepared. Arabinose being convertible into l-glucose and xylose into l-gulose, the alternative formulæ to be considered are—

If the asymmetric system adjoining the COH group, which is that introduced in synthesizing the hexose from the pentose, be eliminated, the formulæ at disposal for the two pentoses are—

When such compounds are converted into corresponding dibasic acids, $\text{CO}_2\text{H}[\text{CH}(\text{OH})]_3\text{CO}_2\text{H}$, the number of asymmetric carbon atoms becomes reduced from three to two, as the central carbon atom is then no longer associated with four, but with only three different radicles. Hence it follows that the "optical" formulæ of the acids derived from two pentoses having the configuration given above will be—

and that consequently only one of the acids will be optically active. As a matter of fact, only arabinose gives an active product on oxidation; it is, therefore to be supposed that arabinose is the - - - compound, and consequently—

When xylose is combined with hydrocyanic acid and the cyanide is hydrolysed, together with l-gulonic acid, a second isomeric acid, l-idonic acid, is produced, which on reduction yields the hexaldose l-idose. When l-gulonic acid is heated with pyridine, it is converted into l-idonic acid, and *vice versa*; and d-gulonic acid may in a similar manner be converted into d-idonic acid, from which it is possible to prepare d-idose. It follows from the manner in which l-idose is produced that its configuration is $\text{CH}_2(\text{OH}) + - - + \text{COH}$.

The remaining aldhexoses discovered by Fischer are derived from d-galactose from milk-sugar. When oxidized this aldhexose is first converted into the monobasic galactonic acid, and then into dibasic mucic acid; the

latter is optically inactive, so that its configuration must be one of those given in the sixth and seventh columns of the table. On reduction it yields an inactive mixture of galactonic acids, some molecules being attacked at one end, as it were, and an equal number of others at the other. On reducing the lactone prepared from the inactive acid, an inactive galactose is obtained from which l-galactose may be separated by fermentation. Lastly, when d-galactonic acid is heated with pyridine, it is converted into talonic acid, which is reducible to talose, an isomeride bearing to galactose the same relation that mannose bears to glucose. As it can be shown that d-galactose is $\text{CH}_2(\text{OH}) + - + - \text{COH}$, d-talose is $\text{CH}_2(\text{OH}) + - + + \text{COH}$.

Apart from the value they possess as extending our knowledge of a particular group of compounds, and because they furnish a complete justification of the doctrine of isomerism due to asymmetry, Fischer's researches supply evidence which cannot be gainsaid that the systems with which the chemist has to deal are intrinsically of a high order of stability, and that the changes they undergo are rarely, if ever, simply the outcome of a state of "intramolecular wobble"; in fact, they afford clear proof that such changes are dependent on and conditioned by extra-molecular or catalytic influences. It will suffice to call attention to a single example in illustration—that afforded by the conversion of gluconic into mannonic acid, and *vice versa*. If in the case of a series of compounds such as the pentahydroxypentanecarboxylic acids any tendency to "wobble" existed, it is to be supposed that of the numerous possible configurations one would prove to be the most stable, and that eventually this would be produced whichever of the isomerides were subjected to the influence of a degree of heat sufficient to cause a change. But nothing of the kind occurs, the change being strictly limited and confined to a particular region within the molecule—to a region which, on various grounds, is to be regarded as particularly susceptible to external influences. The change, in fact, affects only the carbon atom to which the carboxyl group is attached, and it is easy to understand and explain its character. There is every reason to suppose that in the first instance the carboxyl group combines with water—for it will suffice to regard the effect as produced by water alone—and becomes converted into the group $\cdot\text{CO}(\text{OH}) + \text{OH}_2 = \cdot\text{C}(\text{OH})_2$. By the removal of one of the OH groups in conjunction with an atom of hydrogen from the contiguous CH.OH group, an ethenoid compound is formed containing the group $\cdot\text{C}(\text{OH})\text{:C}(\text{OH})_2$. In the final stage this compound combines with water, but in two ways, the ethenoid linkage being split partly on the one side and partly on the other, so that two stereoisomeric acids are formed, but in unequal proportions, owing to the unequal influence exercised by the $\text{C}_4\text{H}_5(\text{OH})_4$ and OH groups attached to the one member of the pair of ethenoid carbon atoms.

The glucoses are much more sensitive to change than are the acids to which they give rise. Lobry de Bruyn has, in fact, shown that when merely left in contact at ordinary temperatures with weak alkali they undergo change in a manner precisely similar to that in which the more stable acids are changed on heating with water. Thus glucose, mannose and fructose are reciprocally converted the one into the other, and although, owing to the formation of acid products, actual equilibrium is never established, the state of reciprocal transformation is practically that represented by the symbols—

It is easy to conceive that changes may take place with

Intra-molecular stability.

such readiness that their complex character and the part played by the catalyst may be entirely overlooked, so that they may come to be regarded as simple intramolecular changes.

Much discussion has taken place on the subject of dynamic isomerism during recent years, and the view has even been advocated that substances may exist in an unsteady state, having at one moment one configuration and an altogether different one at another. Although there is no reason to suppose that such is the case, and the evidence to the contrary is almost conclusive, as a matter of convenience it is well to distinguish isomerides which are so sensitive that they change spontaneously under the influence of necessarily adherent impurities so soon as the conditions are such as to render change possible. Such substances have been called tautomeric; they are more appropriately distinguished as dynamic isomerides, being dynamically equivalent compounds. The conditions which limit the stability of isodynamic compounds have been fully discussed by Lowry (*Trans. Chem. Soc.* 1899, p. 211). The point of chief importance to be borne in mind in connexion with such compounds is that in the fluid state they occur in admixture in dynamic equilibrium, and can only exist separately in a stable condition when in the solid state at temperatures below the stability limit, although the proportion of one of the forms present when equilibrium is reached may be infinitesimal, and the substance consequently appear to be homogeneous. The recognition of dynamic isomerides has an important bearing on the determination of structure from chemical considerations. The outcome of the discussion which has arisen on the subject has been to emphasize the need of extreme care in basing final conclusions on chemical considerations alone, as well as to show the value of physical properties as determinants of configuration. What is of even greater importance, it has drawn attention to the fact that what were formerly regarded as direct products of substitution are in reality very frequently, if not always, simply end products of a series of changes involving, in the first instance, addition—not displacement—and attended with an alteration in type. Ethylic acetoacetate may be referred to as a compound of special interest in connexion with the question under discussion. Under most conditions its behaviour is such as to require its representation as a ketonic compound, $\text{CH}_3\text{CO}\cdot\text{CH}_2\cdot\text{CO}_2\text{Et}$, but in some cases compounds are obtained from it which are clearly derivatives of an enolic form, $\text{CH}_3\text{C}(\text{OH})\text{:CH}\cdot\text{CO}_2\text{Et}$, i.e., a form which is both an ethenoid and an *ol* or alcohol. It is easy to understand how the one form may pass into the other—in the case of the action of sodium ethylate, for example. Instead of hydrogen being displaced by sodium, the ethylate is attracted to the ketonic oxygen—a compound being formed from which alcohol separates, leaving the sodium in combination with the oxygen. The oxygen therefore ceases to be ketonic and becomes “hydroxylic”; thus

When the product is subjected to the action of an alkyl iodide the operation is reversed, and the ketonic type is reverted to; thus

In the year 1875 chemists had prominently under their notice only two types of hydrocarbons—open chain hydrocarbons, such as those of the paraffin, ethylene and acetylene series, and cycloid or closed chain hydrocarbons, such as benzene, naphthalene and anthracene. Not only has our knowledge of these types been considerably extended in the interval, particularly in the case of benzenoid hydrocarbons,

but other distinctly different types have been discovered. The chief interest attaching to these discoveries has lain in the fact that they have disclosed remarkable differences in behaviour depending on the size and structure of the cycloids. The study of the dimensions and characters of such compounds has in consequence assumed considerable importance. It has gradually been placed beyond doubt that the formation of cycloids can only occur in many cases within certain narrow limits, and many facts have been put on record which tend to show that the “affinity” exercised by carbon and other elements in cycloids is a distinctly directed or directive effect. It appears probable, indeed, that considerations inherent, perhaps, in the van't Hoff-Le Bel doctrine of “tetrahedral” carbon may find application, although in quite a different manner, in this field as well as in that of stereoisomerism.

It was long supposed that the simplest ring obtainable contained six atoms of carbon, and the discovery of trimethylene by Freund in 1882 came somewhat as a surprise, especially in view of its behaviour with bromine and hydrogen bromide. Trimethylene is formed on withdrawing the bromine from trimethylene bromide.

Poly-methylene rings.

In comparison with the isomeric ethenoid (ethylene or ethene-like) hydrocarbon propylene, $\text{CH}_2\text{HC}\cdot\text{CH}_2$, it is remarkably inert, being only very slowly attacked by bromine, which readily combines with propylene. But on the other hand, when digested with a saturated solution of hydrogen bromide it is readily converted into normal propyl bromide, $\text{CH}_3\cdot\text{CH}_2\cdot\text{CH}_2\text{Br}$. The separation of carbon atoms united by single affinities in this manner at the time the observation was made was altogether without precedent. A similar behaviour has since been noticed in other trimethylene derivatives, but the fact that bromine, which usually acts so much more readily than hydrogen bromide on unsaturated compounds, should be so inert when hydrogen bromide acts readily is one still needing a satisfactory explanation. A great impetus was given to the study of poly-methylene derivatives by the important and unexpected observation made by W. H. Perkin, junr. in 1883, that ethylene and trimethylene bromides are capable of acting in such a way on the sodium derivative of ethylic acetoacetate as to form tri- and tetra-methylene rings. Perkin has himself contributed largely to our knowledge of such compounds. Penta- and hexa-methylene derivatives have also received considerable attention, and the presumed presence of rings of this kind in camphor and allied compounds has led to an increased interest being taken in their study. The uniform result of all inquiries up to the present time has been to show that the instability of the trimethylene ring is exceptional.

Von Baeyer has sought to explain the variations in stability manifest in the various poly-methylene rings by a purely mechanical hypothesis (*Ber. deut. chem. Ges.* 1885, 2279). Assuming the four valencies of the carbon atom to be directed from the centre of a sphere towards the four corners of a regular tetrahedron inscribed within the sphere, the angle at which they meet is $109^\circ 28'$. Baeyer supposes that in the formation of carbon “rings” the valencies become deflected from their positions, and that the tension thus introduced may be deduced from a comparison of this angle with the angles at which the strained valencies would meet. He regards the amount of deflection as a measure of the stability of the “ring.” The readiness with which ethylene is acted on in comparison with other types of hydro-

Baeyer's strain hypothesis.

Structure of hydrocarbons.

carbon, for example, is in harmony, he considers, with the circumstance that the greatest distortion must be involved in its formation, as if deflected into parallelism each valency will be drawn out of its position through $\frac{1}{2}.109^{\circ} 28'$. The values in other cases are—

The general behaviour of the several types of hydrocarbons is certainly in accordance with this conception, and it is a remarkable fact that when benzene, apparently the most stable of all cycloids, is reduced by heating with hydrogen iodide, it is not, as was long supposed to be the case, converted into hexamethylene, but into methylpentamethylene (cf. Markownikoff, *Liebig's Annalen*, 1898, 302, 1); and by no means a few other cases of the conversion of six-carbon rings into five-carbon rings have been recorded in recent years. Similar considerations will apply to rings containing other polyad elements besides carbon, but it is impossible to discuss these cases at present on account of the inadequacy of the evidence as to the "valency" of such elements. As an illustration it may be pointed out, however, that in the case of the two known types of lactones—the half-acid, half-alcoholic ethers formed from hydroxyacids by internal condensation—the γ -lactones, which contain four carbon atoms and one oxygen atom in the ring, are more readily formed and more stable (less readily hydrolysed) than the δ -lactones, which contain one oxygen and five carbon atoms in the ring. That the number of atoms which can be associated in a ring by single affinities is limited there can be no doubt, but there is not yet sufficient evidence to show where the limit must be placed.

Baeyer has suggested that his hypothesis may also be applied to explain the instability of acetylene and its derivatives, and the still greater instability of the polyacetylene compounds. The objections to all such "explanations" is their purely "mechanical" character, and in using them it is necessary to bear this in mind. More especially must it be remembered that what is needed is not so much an explanation of instability as of the greater activity of certain types of compound. This dynamical side of the problem has hitherto been practically entirely left out of account, it being impossible to deal with it with the means at present at our command.

In the case of closed chain hydrocarbons in which the carbon atoms are not fully saturated with hydrogen as they are in the poly-methylenes, conditions prevail which have the effect of introducing limitations, so that apparently there are but few forms possible. Of these the benzene ring, composed of six atoms of carbon, is the most stable, this ring, or colloca-tions of such rings, being produced particularly in changes occurring at very high temperatures—as in the formation of coal-tar for example. The question of the intimate structure of benzene is therefore of special interest. It has been a subject of constant discussion since Kekulé in 1865 enunciated the conception that the six carbon atoms are directly united together in a closed chain, each of them being also united with a single hydrogen atom, so that the cycloid consists of six CH groups, and is therefore a symmetrical structure. This has been proved to be the case in the most absolute manner possible. Each carbon atom in the ring is, *ex hypothesi*, associated with neighbour-

ing carbon atoms in such a manner that at least two of its affinities are engaged—one on either side—and a third affinity of each atom is in combination with hydrogen. To account for the disposal of the fourth affinity Kekulé suggested as most probable that the carbon atoms were united alternately by one and two affinities, and to the present day this hypothesis is regarded with favour. Two great objections have been urged against it, however. The first is that di-derivatives in which the radicles are associated with contiguous carbon atoms—so-called ortho-compounds—should differ according as these carbon atoms are associated by a single or by two affinities. No such difference has been observed. This objection has always been felt to be of the greatest weight. To dispose of it, Kekulé suggested that the distribution of the affinities within the ring must be supposed to vary, so that at one moment the configuration will be that represented by the first, and at the next that represented by the second of the following figures:—

On this assumption the compound AB is a mixture in equal proportions of substances which cannot be separately dealt with. The explanation has never been regarded as satisfactory, no independent evidence having been obtained which would make it necessary to admit that such an oscillation of the affinities can and does take place. On the contrary, the results of modern inquiry appear uniformly to favour the view that when such changes occur they are not the result of mere internal oscillation, but are occasioned by catalytic influences, and take place only because the molecule becomes included with other bodies in a system. An argument of far greater weight against the ethenoid formula of benzene is furnished by the behaviour of benzenoid compounds generally in comparison with that of ethenoid compounds. Ethylene, and practically all of its derivatives, are eminently unsaturated compounds, combining—under appropriate conditions—with bromine, the halhydrides, &c., with the greatest readiness. Benzene, therefore, if it contain these ethenoid linkages, should be even more active than ethylene. But such is not the case, the behaviour of benzenoid compounds generally being rather that of saturated than of unsaturated compounds, as in most cases they afford substitution derivatives. This argument becomes convincing when dihydro- and tetrahydro-benzene are taken into account. These behave as ethenoid compounds, being prone to change and combining as readily as the corresponding open chain derivatives do with various other substances. It cannot, therefore, be argued that the association of several ethenoid linkages in a ring has the effect of reducing their activity.

The diagonal formula advocated by Claus, in which the affinities are represented as united in pairs across the ring, although not open to the criticisms which apply to Kekulé's formula, has met with but little support; there would seem, in fact, to be an instinctive objection to the assumption that affinities can act across one another. This difficulty is got over in the "centric" formula proposed by the writer (*Phil. Mag.*; *Trans. Chem. Soc.* 1887, 264), and shortly afterwards by v. Baeyer, in which the fourth affinity of each carbon atom is assumed to be only directed towards the centre of the ring—no one of the carbon atoms being regarded as

**Kekulé's
benzene
formula.**

**Other
benzene
formulae.**

connected with any other carbon atom not contiguous to it in the ring, although each is supposed in a measure to exercise an influence over each and all the other carbon atoms. This conception is represented by the following symbol:—

Notwithstanding its vagueness, the centric symbol appears to be better adapted than any of those hitherto proposed as a means of formulating the behaviour of benzene.

Whatever its structure, the benzene complex has altogether peculiar properties. The hydrocarbon itself, under certain conditions, combines readily enough with chlorine and bromine, forming a hexachloride and hexabromide; but none of its homologues and scarcely any of its derivatives furnish similar compounds. Under all "ordinary" conditions benzene and its homologues yield substitution derivatives. When subjected to the action of either chlorine or bromine, benzene responds somewhat sluggishly, but much depends on the catalyst used in determining the interchange; comparatively little heat is developed. The homologous hydrocarbons, as a rule, are far more easily acted on by halogens. The benzene hydrocarbons are also readily converted into nitro-derivatives by nitric acid, and into sulphonic acids by sulphuric acid, the action of both agents taking place more readily in the case of the higher than of the lower terms of the series. There is every reason, however, to suppose that substitution is not directly effected. In the case of mono-derivatives, probably the centric mechanism breaks down initially, and a compound is formed by the union of the agent with contiguous carbon atoms of the hydrocarbon; this change is immediately followed by one in the reverse direction in which one of the radicles thus introduced into the molecule becomes separated together with an atom of hydrogen. For example:—

The action may take place in one or the other direction, or in both, according to circumstances. Thus, on nitrating benzene by nitric acid ($\text{HO}\cdot\text{NO}_2$) alone, both nitrobenzene and phenol are produced, the latter, of course, undergoing further nitration, as it is readily acted on; but if the nitration be effected in presence of sulphuric acid, the separation of water from the compound first formed by the union of the benzene with the nitric acid is promoted owing to the affinity of this agent for water, and consequently nitrobenzene is practically the sole product.

The mono-derivatives of benzene are all convertible into higher derivatives, and in some cases are far more readily acted on than is the original hydrocarbon; but the benzene hydrocarbons are not peculiar in this respect, as it is well known that even in the paraffin series the higher terms are much more readily acted on than are the lower ones, and that the alcohols, for example, are readily attacked under conditions under which the hydrocarbons from which they are derived are unaffected. As it is to be supposed that in most, if not in all cases, the available

energy of the system becomes reduced in the formation of the substitution derivative, it is rather to be expected that if acted on in the same way, *i.e.*, if the nature of the process be the same, substitution derivatives would be less amenable than the parent compounds. The fact that this is not always so may, therefore, be regarded as proof that the radicle introduced into a hydrocarbon in some cases itself plays an important part in conditioning change, and is itself attractive. This view derives much support from the study of the behaviour of phenol and aniline, both of which are extraordinarily sensitive in comparison with benzene—the mere addition of bromine in excess to an aqueous solution of either giving rise immediately to a precipitate of the tribromo-derivative, although benzene itself is but slowly and imperfectly converted into monobromobenzene when placed in contact with an excess of the halogen. In like manner the nitration of phenol is readily effected by means of dilute nitric acid, being without difficulty extended to the formation of the tri-nitro compound, while to nitrate benzene it is necessary to use a fairly concentrated acid, and nitration is with difficulty extended beyond the formation of the di-derivative. Again, phenol is rapidly sulphonated by ordinary concentrated sulphuric acid, which acts but very slowly on benzene. In the case of the carbinols—the alcohols derived from the open chain hydrocarbons—the action of acids is to form an ethereal salt; ordinary alcohol, for example, yields ethylic hydrogen sulphate. Being alcohols the phenols should behave similarly, and there is reason to suppose that they do. The explanation of their apparently different behaviour is to be found in the fact that in the case of the sulphates derived from the carbinols there is no tendency for the SO_3 group to separate from the oxygen atom of the carbinol, and eventually to enter into combination with the hydrocarbon radicle; in the case of the sulphate derived from the phenol, however, such a change readily occurs, it being necessary, for example, to heat the salt $\text{KSO}_3\cdot\text{OC}_6\text{H}_5$ only moderately to convert it into the sulphonate $\text{HO}\cdot\text{C}_6\text{H}_4\cdot\text{SO}_3\text{K}$. On this account the formation of the sulphate from the phenol is easily overlooked.

But it is necessary to go further in order to explain the behaviour of benzenoid derivatives generally, and to consider the cases in which the formation of intermediate compounds such as the sulphate cannot take place. The behaviour of the mixed ethers formed from phenols by introducing alkyl radicals in place of the hydroxylic hydrogen is specially suggestive. These compounds resemble phenol in being more amenable to treatment than is benzene, but they are very distinctly less active than phenol. The difference is most striking, however, when corresponding derivatives are contrasted. Phenol is converted by sulphuric acid into phenolparasulphonic acid, $\text{HO}\cdot\text{C}_6\text{H}_4\cdot\text{SO}_3\text{H}$. If bromine be added to an aqueous solution of this compound, diorthobromophenolparasulphonic acid is produced almost immediately; if an excess of bromine be used, the sulphonic group is also displaced by bromine, tribromophenol being formed, but this action does not set in until the whole of the phenolsulphonic acid has been dibrominated. The corresponding sulphonate derived from methylphenyl ether, $\text{CH}_3\cdot\text{O}\cdot\text{C}_6\text{H}_5$, formed by introducing methyl in place of the hydrogen in the OH group in the phenolparasulphonic acid, behaves in a remarkably different manner towards bromine, yielding no trace of dibromo-acid, but only the monobrominated acid. But only a part of the compound is thus acted upon; from the remainder the bromine simply displaces the sulphonic group. Acid radicles have a still more marked effect, bromine being without action on benzoylet phenolparasulphonic acid ($\text{C}_6\text{H}_5\cdot\text{CO}\cdot\text{O}\cdot\text{C}_6\text{H}_4\cdot\text{SO}_3\text{H}$) under conditions

under which the unbenzoylated acid is entirely converted into tribromophenol.

Results such as these show that the introduction of various radicles in place of the hydroxylic hydrogen most materially affects the character of the influence exercised by the oxygen in phenol, and they afford a clue to the manner in which the action takes place. It can scarcely be doubted that initially the oxygen attracts the bromine to itself, and that when the bromine has thus been made a part of the molecule, it is capable—under proper conditions—of producing further changes, and eventually of displacing hydrogen in the hydrocarbon portion of the molecule. "*Ce n'est que le premier pas qui coûte*"—everything depends on the bromine becoming introduced into the molecule. The affinity of oxygen for bromine—and it may be supposed for other agents—is evidently of a somewhat fickle character; it varies greatly according to the nature of the groups with which the oxygen is associated, some rendering the oxygen altogether indifferent.¹

The properties of anilineparasulphonic acid are modified in precisely the same way as are those of phenolparasulphonic acid by introducing hydrocarbon and acid radicles in place of the hydrogen atoms in the NH_2 group. Thus dimethylanilineparasulphonic acid yields only a monobromo-derivative, whereas the unmethylated acid is at once converted into tribromaniline by bromine; in this case the sulphonic group does not become displaced. If, however, acetyl or benzoyl be introduced in place of one of the hydrogen atoms of the NH_2 group, bromine is at once able to displace the sulphonic group, parabrom-acet- or benz-anilide being formed together with the monobrominated sulphonic acid. Evidently, therefore, the influence of nitrogen, like that of oxygen, varies greatly according to the nature of its associates.

Assuming that the first stage in the formation of the substitution derivative from the phenol or amine consists in the attraction by the oxygen or nitrogen of the particular agent used, it remains to determine what are the consequent changes. With this object in view, the behaviour of acetanilide on chlorination is especially deserving of study. Initially this compound exchanges its aminic hydrogen for chlorine, and probably a change of this kind invariably takes place when amines are chlorinated. The compound thus produced, phenylacetylchloramine, $\text{C}_6\text{H}_5\cdot\text{N}(\text{C}_2\text{H}_5\text{O})\text{Cl}$, when carefully purified, is a fairly stable substance, but if it be brought into contact with a trace of hydrogen chloride, it is rapidly converted into parachloroacetanilide, much heat being developed; on this account, in preparing it and similar compounds it is necessary to avoid the presence of hydrogen chloride. The transference of chlorine from the nitrogen atom into the hydrocarbon radicle

which is provoked by hydrogen chloride, would seem to be dependent on the combination of the chloramine with hydrogen chloride, whereby a condition of extreme instability is engendered. Probably the first change to follow this is one in which the atom of chlorine associated with the nitrogen atom escapes together with an atom of hydrogen from the hydrocarbon complex. It may be supposed that this would lead to a "wave of disturbance" being generated within the ring, and that for the moment

¹ The discovery of diethylperoxide, $\text{C}_2\text{H}_5\cdot\text{O}\cdot\text{O}\cdot\text{C}_2\text{H}_5$, a relatively stable compound, by Baeyer and Villiger, has afforded direct proof that the "activity" of oxygen is much reduced by association with hydrocarbon radicles.

the nitrogen atom would also be unsaturated; as a consequence, the centric mechanism might break down and lapse into the ethenoid condition. If, at such a moment, hydrogen chloride were again to combine with the molecule, a compound might be formed which could undergo decomposition in such a way that the chlorine atom remained in the orthoposition, the hydrogen atom separating with the chlorine atom attached to the nitrogen atom—or the two chlorine atoms might attract each other, in which case the chloramine would be reduced. As a matter of fact, only a relatively small proportion of orthochloroacetanilide is formed, the para-compound being always the chief, and under most conditions, the sole product; it therefore seems probable that when the conditions permit, instead of the two chlorine atoms actually separating from the system in the manner pictured, they attack the para-position, removing the hydrogen atom and taking its place. With regard to the possible reduction of the chloramine, although unobserved in the case of phenylacetylchloramine, such an action actually does take place in some cases, parachlorophenylacetylchloramine, for example, being converted into parachloroacetanilide and chlorine by the action of a concentrated solution of hydrogen chloride, although if heated with water and a trace of hydrogen chloride it undergoes isomeric change into dichloroacetanilide. No more striking proof could well be given that the hydrocarbon radicle is insensitive to direct attack by chlorine, and that its chlorination is effected indirectly.

That sulphonation involves a similar series of changes there can be little if any doubt, as acetanilide behaves towards sulphonating agents just as it does on chlorination; when cautiously dissolved in moderately strong fuming sulphuric acid, it is in the first instance converted into the sulphaminic acid $\text{C}_6\text{H}_5\cdot\text{N}(\text{C}_2\text{H}_5\text{O})(\text{SO}_3\text{H})$. If the liquid mixture be at once poured into water, and the solution boiled, only aniline para-sulphonic acid is obtained, but if the mixture be preserved at a low temperature and allowed gradually to hydrate, and then boiled with water, besides para-acid a considerable amount of ortho-acid is also produced. In this case, as on chlorinating acetanilide, the ortho-compound is formed when the substituting radicle is, as it were, let down gently; otherwise the para-derivative is alone produced.

As compounds such as dimethylaniline, $\text{C}_6\text{H}_5\cdot\text{N}(\text{CH}_3)_2$, are chlorinated, sulphonated, &c., without difficulty, it cannot be supposed that the introduction either of chlorine or of the sulphonic group into the aminic group is an essential preliminary to the introduction of either the one or the other of these radicles into the nucleus. The explanation given above, in fact, does not necessarily require the direct transference of the radicle from the aminic group into the nucleus, but it is clear that such a direct transference may take place, in view of the fact that nitrosomethylaniline, $\text{C}_6\text{H}_5\cdot\text{N}(\text{CH}_3)(\text{NO})$, for example, is entirely converted into paranitrosomethylaniline, $\text{NO}\cdot\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{CH}_3$, by the action of hydrogen chloride, inasmuch as it can scarcely be doubted that if the NO group ever became separated from the molecule, it would not be entirely returned. A similar argument may be based on the complete conversion of diorthonitroparabromophenol into orthoparadininitroorthobromophenol by the action of bromine; and on the formation from orthiodanisole of pariodonitranisole on nitration

As iodine substitution derivatives are rarely formed by

the direct action of iodine, the latter change is a particularly striking proof of the transference of a radicle from one position to another within the molecule. That such transferences are but the end result of a series of changes more or less of the character of those pictured above is more than probable.

In the case of phenol and aniline, whatever the agent used in effecting substitution, the entering radicle as a rule always takes up either the para- or the ortho-position relatively to the OH or NH₂ group; in fact, when this is not the case, and a meta-derivative is formed, it is probably because—as will be explained later—the compound no longer acts as an OH or NH₂ derivative. In other cases in which para- and ortho-derivatives are exclusively formed, the influence exercised by the radicle present in the mono-derivative may obviously be regarded as of the same order as that exercised by either oxygen or nitrogen, and it is a logical extension of this argument to assume that the process by which the higher derivative is formed is similar in character, whether the mono-derivative contain OH, NH₂, Cl, CH₃, or any other radicle which conditions the entry of the second group into the para- and ortho-positions only. If this conclusion be accepted, it follows that CH₃ and other hydrocarbon radicles must be regarded as possessed of considerable attractive power, as the homologues of benzene are so much more readily acted on than benzene itself.

Certain radicles, notably acid radicles such as NO₂, SO₃H and CO₂H, condition the formation of meta-derivatives, mono-derivatives of benzene containing these radicles yielding but a small proportion of the ortho- and para-compounds. Thus nitrobenzene is almost entirely converted into metabromonitrobenzene when brominated, although when bromobenzene is nitrated the chief product is parabromonitrobenzene, no meta-compound being formed. Agents generally act on all mono-derivatives which afford meta-di-derivatives less readily than on benzene; hence it may be inferred that radicles such as NO₂ have little if any power of attracting "acid" agents such as the halogens, nitric and sulphuric acids, &c. It may further be supposed that not only do they not attract, but that they actually protect the ortho- and para-positions against attack, exercising an inhibiting power similar to, but even stronger than, that which—as previously pointed out—the oxygen and nitrogen of phenol and aniline appear to exert when associated with acid radicles. Consequently, if mono-derivatives containing acid radicles are acted on by agents which are sufficiently powerful to act on the hydrocarbon ring, they behave much as benzene behaves, but the position attacked is that which is least exposed to the influence of the acid radicle—that is to say, the meta-position. Proof of the correctness of this argument is afforded by the fact, that if an agent be used which is attracted by the acid radicle, substitution no longer takes place in the meta-position; thus when nitrobenzene is heated with powdered caustic soda it is converted into orthonitrophenol. On the other hand, if the basic or acid-attracting power of aniline be sufficiently lowered or neutralized, as for instance by combination with sulphuric acid or by benzylation, meta-derivatives are formed in no inconsiderable proportion on nitration and sulphonation.

It will be obvious that the issues raised by the study of the formation of substitution derivatives from benzene

are many and complicated, and that, in order to get behind the facts, it is necessary to take many considerations into account. In studying phenol and aniline, the peculiarities of oxygen and nitrogen must be reckoned with as much as those of benzene; on the other hand, much is learnt of the manner in which

these elements exercise their functions by studying phenol and aniline. It is too often forgotten that phenol is a derivative of oxygen, and aniline a derivative of nitrogen, and that these compounds are not merely to be regarded as derivatives of benzene; in point of fact, it is only when they are considered from the former point of view that their benzene function can be properly understood, and that it becomes apparent how false an estimate is usually formed of this function. In the formation of benzenoid derivatives, in cases in which the attack proceeds from a radicle in position 1, the para-derivative is almost invariably the chief if not the sole product, and so much is this the case that attention has been called, over and over again, to the need of giving expression to the fact in the formula of benzene. The centric symbol, more than any other, may be said to indicate and almost to require such a result. For if the view be taken that, as explained above, addition precedes substitution, whatever change takes place in region 1, it is to be supposed that the *opposite* centric valency will be the one most affected; and if the effect be—as it most probably is—to release it either partially or entirely, region 4 will, as a rule, prevail over the other regions as a centre of activity into which the entering group will be determined. From this point of view the formation of ortho-derivatives is to be regarded as a consequence of the immediate contiguity of regions 1 and 2. But contiguity constitutes a disadvantage as well as an advantage, as it renders the possibility of reversal greater, and it is only in cases in which reversal occurs with comparative difficulty that the ortho-compound is formed in any considerable proportion. Thus the fact that phenol yields only a small proportion of the ortho-bromo-, but a considerable proportion of the ortho-chloro-derivative, may be ascribed to the circumstance that when once introduced chlorine is both more firmly held and less liable to be displaced by a reversal of the interchange.

Although similar to benzene in general behaviour, the hydrocarbons formed by the "fusion" of two or more benzene rings all exhibit distinctive properties; the study of these is of special interest and importance in considering the manner in which properties are correlated with structure. Naphthalene, anthracene and phenanthrene may be taken as examples.

Naphthalene, C₁₀H₈, is proved beyond question to consist of two benzene rings with one pair of carbon atoms in common. It is also certain that the two rings are alike, and that the compound as a whole is symmetrically constituted; consequently naphthalene is represented by the double hexagon symbol, and for all practical purposes this symbol is sufficient. As in the case of benzene, the determination of the inner structure of the molecule is a matter of great difficulty. It is noteworthy, in the first place, that naphthalene is much more sensitive to attack than is benzene; as no distortion of either ring is involved in the "fusion" of two rings, this fact is not in harmony with v. Baeyer's mechanical hypothesis. If the carbon atoms are represented as alternately singly and doubly linked, as in Kekulé's formula of benzene, there would be no fewer than five pairs of doubly-linked carbon atoms in the molecule. The behaviour of naphthalene cannot, however, be said to be that which a compound so constituted would be likely to exhibit, although it is distinctly more ethenoid in character than that of benzene. To apply the centric hypothesis to naphthalene, it is necessary to assume that one of the affinities of each of the two central carbon atoms common to the two rings *acts into* both rings, as pictured in the symbol, which is an assumption involving a somewhat wide departure from all ordinary views as to the manner in which affinity acts. Nevertheless the

symbol is one with the aid of which alone, perhaps, the general behaviour of naphthalene may be satisfactorily expressed. In the first place, it harmonizes with the fact that the complete sympathy, the every change made in account of the reluctance divided—influenced—exercised upon the two affinities common to both, the remaining four centric affinities of each ring would presumably be less attracted into the ring than in the case of benzene; consequently they would be more active outwards, and combination would set in more readily. When, as in the formation of naphthalene tetrachloride, for example, the one ring becomes saturated, the other might be expected to assume the normal centric form and become relatively inactive. This is absolutely the case. On the other hand, if substitution be effected in the one ring, and the affinities in that ring become attracted inwards, as apparently happens in the case of benzene, the adjoining ring should become relatively more active because the common affinities would act less into it. Hence, unless the radicle introduced be one which exercises a special attractive influence, substitution should take place in preference in the previously unsubstituted ring. In practice this usually occurs; for example, on further bromination, α -bromonaphthalene yields a mixture of the two dibromonaphthalenes

place, it harmonizes two rings are in common responding to the other. Then, on a relatively slight—balance—which would be two rings by the

brominated, or nitrated or sulphonated, the action is practically confined to the second ring. An alternative centric formula for naphthalene is that proposed by Bamberger.

Instead of representing it as a dicyclic hydrocarbon, formed by fusion of two benzene rings, this indicates that it is a monocycloid composed of ten atoms of carbon. The formula has the advantage that it may be constructed from

tetrahedral models of the carbon atom; but it involves the assumption that the molecule has within it a mechanism, equivalent in a measure to a system of railway points, which can readily close up and pass into that characteristic of benzene.

The isomeric hydrocarbons anthracene and phenanthrene, $C_{14}H_{10}$, are to be regarded as formed by the fusion of three benzene rings in the manner represented by the symbols

Anthracene.

Phenanthrene.

Their behaviour, and therefore their inner structure, is very different, however, and particularly noteworthy in comparison with that of naphthalene. In both cases the median ring is most easily acted on; but whereas phenanthrene behaves as a symmetrical compound, the behaviour of anthracene is that of an unsymmetrical compound, one of its lateral rings being far more readily attacked than the other. For example, both hydrocarbons at once combine with bromine, forming unstable dibromides, which are readily resolved into hydrogen bromide and monobromo-substitution derivatives; the further action of bromine leads to the production of a di-substitution-derivative. The action then stops in the case of phenanthrene, unless forced, but dibromanthracene readily combines with bromine, forming dibromanthracene tetrabromide. In both cases the dibromo-substitu-

tion derivatives are formed by the displacement of the hydrogen atoms in the median ring. The following formulæ afford a satisfactory expression of these facts, it being understood that the hexagons marked C have the centric structure:—

An entire change of properties is produced by saturating the two carbon atoms of the median ring in anthracene, and there can be little doubt that the lateral ethenoid ring lapses into the centric state, a symmetrical compound being produced. Thus anthracene dihydride has more of the properties of a saturated hydrocarbon, and anthra-

ertness; moreover, when the latter is attacked both lateral rings are equally readily acted upon. On the other hand, the behaviour of phenanthraquinone in no way differs in principle from that of phenanthrene. It is noteworthy that although the lateral rings in phenanthrene are in the condition of ortho-di-derivatives of benzene, they do not display the activity of ortho-homologues of benzene—which is a fact not without bearing on the question as to the character of the influence exercised by hydrocarbon radicles in promoting substitution. It has been previously pointed out that the evidence favours the view that the open chain hydrocarbon radicle in a benzenoid hydrocarbon has an attractive influence comparable with that exercised by oxygen in phenols and by nitrogen in amines; as it is not to be expected that the median closed chain which in phenanthrene occupies the place of the two separate radicles in an ortho-derivative of benzene would have any such influence, the behaviour of phenanthrene lends considerable support to this view. The argument may be one on which no great stress should be laid; it is advanced mainly with the object of calling attention to the way in which the study of polycyclic hydrocarbons may serve to elucidate questions of general importance. The bearing of individual facts on the broad problems of chemistry is too commonly overlooked nowadays, and it is very necessary that chemists should seek to appreciate more fully than they do at present the general interdependence of chemical phenomena, and to correlate their observations more carefully with the existing body of facts.

It remains to consider the behaviour of mixed cycloids in which multivalent elements other than carbon are included; this is in many respects very remarkable. Pyridine and thiophene may be taken as **Hetero-cycloids**. examples. Pyridine, C_5NH_5 , is derived from benzene by the displacement of one of the CH groups by an atom of nitrogen. The effect of this change is to lower materially the activity of the cycloid in comparison with that of benzene. Although the nitrogen in pyridine exhibits marked basic properties, apparently it has little or no influence—such as is exercised by the nitrogen in aniline—in promoting the introduction of substituting groups into the ring in place of hydrogen, substitution being effected only with difficulty. The arguments which favour the adoption of the centric formula for benzene apply with even greater force to pyridine, and render such a formula for this compound almost a necessity, but the adoption of the centric formula for pyridine has important consequences, as it involves the conclusion that the addition of a nitrogen affinity to five carbon affinities not only

has no disturbing effect, but apparently even strengthens the affinity of these latter for each other.

The case of thiophene is even more remarkable. In this compound two of the CH groups in benzene are displaced by a single atom of sulphur. Notwithstanding the great difference in composition, in general chemical behaviour the two compounds are almost indistinguishable, corresponding derivatives manifesting the most remarkable similarity, extending even to their boiling-points. Thiophene is more readily acted upon by halogens than is benzene, being attacked even by iodine, but it shows no tendency to combine with them, and yields only substitution derivatives. The most striking circumstance in connexion with thiophene, however, is the complete inertness of the sulphur atom, which shows no tendency to combine, and cannot even be oxidized; yet it cannot well be present otherwise than as a dyad. This behaviour appears the more remarkable when thiophene is compared with the corresponding compounds furfuran and pyrrole, containing respectively oxygen and the imido (NH) group instead of sulphur, these latter being far more active substances and remarkably sensitive to the action of acids. Whether the oxygen and imidogen exercise a special attractive influence, such as has been previously referred to, which sulphur cannot exercise, or whether the difference originates in a difference in constitution, cannot at present be decided, though the former appears to be the more probable explanation. It is noteworthy that in diphenylene sulphide (dibenzothiophene)—a compound which bears the same relation to thiophene that anthracene bears to benzene—the sulphur behaves normally in the sense that it is oxidizable, like the sulphur in open chain sulphides such as ethyl sulphide ($C_2H_5)_2S$. As thiophene in no way exhibits

the behaviour of an ethenoid compound, it is appropriately represented by the centric formula in the margin. But it is conceivable that the sulphur, although acting only as a dyad, has its extra affinities *twisted inwards* into the ring: hence their inactivity. No such condition need prevail in diphenylene sulphide, as there would be no carbon affinities directed inwards in the median ring if the lateral rings had a centric structure. This, again, is an example of the manner in which an instructive comparison may be made between single and complex cycloids. The difference between a "strutted" benzenoid system and a flaccid saturated cycloid is well shown in the fact that, although it is impossible to obtain an anhydride from metaphthalic acid, hexhydrometaphthalic acid, like glutaric acid, is without difficulty converted into an anhydride; and the same kind of difference appears to exist between thiophene and dibenzothiophene.

Diphenylene sulphide.

In concluding this section, the question may be raised whether the centric structure may still be preserved in compounds formed from benzene by satisfying two of the centric units of affinity. In the case of the derivatives of dihydrobenzene, C_6H_8 , such as the dihydrophthalic acids, there can be little doubt that the compound has lapsed into the ethenoid form, as these readily combine not only with bromine, but also with the halohydrates. But quinone, on the other hand, is a relatively inert compound, and it is therefore not improbable that it retains the centric structure, and may consequently be so represented—as in the margin.

Sufficient will have been said to indicate the nature of some of the chief problems presented by cycloid compounds. The number of varieties, especially of heterocycloids, made known since 1875 is very large, but apparently these may all be referred to a very limited number

of fundamental types, and it is therefore justifiable to assume that their formation is governed by comparatively simple laws.

In comparison with that of the closed chain compounds the behaviour of open chain compounds is in principle far simpler. In the case of saturated compounds substitution appears to take place directly, but there is no evidence to show the precise manner in which it is effected; in fact, little more can be said than that it occurs the more easily the higher the molecular weights. Whether or not at the moment of collision of the interacting molecules weak associations are established between them cannot at present be determined: the most that can be said is that it is by no means improbable that such is the case, and that the assumption is one which apparently would bring the behaviour of saturated into harmony with that of unsaturated compounds generally. A point of importance to be noted in this connexion, however, is the fact that the occurrence of several carbon atoms in association usually constitutes a position of weakness in the molecule. For example, to take the simplest case, propane, $CH_3.CH_2.CH_3$, is chiefly attacked in the median CH_2 group, a larger proportion of isopropyl chloride, $CH_3.CHCl.CH_3$, than of the isomeric propyl chloride, $CH_3.CH_2.CH_2Cl$, being formed when the hydrocarbon is chlorinated. In the case of a hydrocarbon of the type CHR'_3 , the hydrogen atom of the CH group is still more sensitive to attack than that in the CH_2 group of the type $CH_2R'_2$. Facts such as these serve to suggest that even in what are conventionally regarded as saturated compounds carbon exercises an attractive influence similar to that pictured above as exercised by oxygen, nitrogen, etc. Such a conclusion is in harmony with that already arrived at with reference to the influence exercised by saturated hydrocarbon radicles in the case of the homologues of benzene.

Effects similar to those produced by the association of several carbon atoms are observed to follow the introduction of negative radicles such as chlorine, bromine, or OH, the rule being that negative radicles tend to accumulate. Thus the primary alcohols of the formula $R'.CH_2(OH)$, are converted into aldehydols, $R'.CH(OH)_2$, by most oxidizing agents; and bromethane, $CH_3.CH_2Br$, when heated with bromine, yields chiefly ethylidene bromide, $CH_3.CHBr_2$. But there are many apparent exceptions to this rule. Thus, although aldehyde, $CH_3.COH$, is entirely converted into acetic acid, $CH_3.CO_2H$, when oxidized by bichromate mixture—the aldehydrol being presumably converted into the acid-hydrol, $R'.C(OH)_3$, which breaks up into acid and water—when oxidized by nitric acid it yields glycollic acid, $CH_2(OH).CO_2H$, and glyoxal, $COH.COH$. Similarly, if bromethane be brominated in presence of ferric bromide, it is converted into ethylene bromide, $CH_2Br.CH_2Br$; in fact, experiments made by V. Meyer and his pupils have shown that when bromides or chlorides are brominated in presence of ferric bromide, or chlorides chlorinated by means of antimony pentachloride, instead of a second atom of halogen becoming attached to the one carbon atom, it associates itself with the contiguous atom. In the case of the more complex hydrocarbons, by continuation of this treatment, the action may be extended from atom to atom along the chain—hexane, for example, giving a hexbromide in which each carbon atom is associated with a bromine atom. Such departures from the rule, however, but serve to prove it. In seeking to explain such variations, it is necessary to bear in mind that variations in the course of the interchange may be conditioned by the use of different agents, and that intermediate unperceived changes occur in all such cases. A catalyst such as ferric bromide plays an

Open chain compounds.

Effect of negative radicles.

all-important part, not merely in facilitating the occurrence of change, but also in determining its course. Probably it acts in more ways than one, both determining the initial attack by coupling halogen with hydride and also promoting the separation of halohydride (hydrogen bromide or chloride). If it be assumed that the catalyst combines either with the halogen atom or with the carbon atom with which this latter is associated, it would in a measure protect the hydrogen also associated with the carbon atom, and project the attack, as it were, upon the hydrogen atom associated with the contiguous carbon atom. In such cases it may well happen that an ethenoid compound is either potentially or actually formed as an intermediate product. Thus when aldehyde is oxidized in presence of nitric acid, perhaps a nitrate is first produced which loses water, and the compound thus formed then combines with the elements of the water molecule in the reverse order, giving rise to a derivative of glycol,

which on oxidation yields glycollic acid, $\text{CH}_2(\text{OH}).\text{CO}_2\text{H}$.

That oscillatory reversible changes are of far more frequent occurrence than is commonly supposed cannot be doubted, and there is every reason to suppose that many apparently obscure or abnormal cases are to be explained as consequences of such changes. One or two such instances may be referred to in illustration. It is well known that paraffin radicles are readily introduced into benzene and its homologues by the interaction of the benzene and an alkyl chloride in presence of aluminium chloride—one of the most remarkable of condensing agents. It is a peculiar property of this agent, however, that very frequently the entering radicle takes up the meta- rather than the ortho- or para-position, which is that assumed when milder agents producing similar effects—such as ferric chloride, and in some cases sulphuric acid—are used. Aluminium chloride, however, is not only a most powerful synthetic agent, but—as its discoverers, Friedel and Crafts, have shown—equally powerful as an analytic agent, destroying as readily as it builds up. Apparently reversal takes place much more readily in the case of para- or ortho- than of meta-compounds. To take a specific case, that of the butylation of toluene—the initial product is probably a mixture of para- and meta-butyltoluene in which the former largely preponderates, but the action being reversible in the manner expressed by the equation $\text{C}_6\text{H}_5.\text{CH}_3 + \text{BuCl} \rightleftharpoons \text{C}_6\text{H}_4(\text{Bu}).\text{CH}_3 + \text{HCl}$, and the para-compound being chiefly attacked as the action proceeds, the meta-compound is formed in an increasing proportion—so that ultimately little or no para-butyltoluene remains.

Regarding the behaviour of saturated compounds towards agents generally from the point of view discussed in this section, it is obviously analogous to that of benzenoid compounds; in fact there is no need to draw any radical distinction between the two classes. In both cases action takes place initially in much the same way, but different secondary changes supervene, chiefly owing to the fact that in saturated compounds, usually two, and sometimes three hydrogen atoms are associated with the carbon atom which is the centre of attack, but never more than one in the case of the benzenes.

The primary change in all interactions in which the ethenoid compounds are concerned appears always to be one involving the conversion of the ethenoid, by combination with the agent, into a saturated (paraffinoid) compound. The action probably takes place in two stages—in the first, the two molecules associate as wholes; in the second, the two

radicles, into which the agent is resolved, become distributed and combine with the ethenoid carbon atoms. Such changes occur, as a rule, very readily; indeed, there is reason to suppose that the combining power of ethenoids has been considerably underrated. Their activity must be ascribed to the “attractiveness” of the two contiguous carbon atoms united by ethenoid affinities, a form of union which leaves these atoms endowed with considerable residual affinity. Whatever the nature of this form of union may be, it has clearly less than twice the force of that by which carbon atoms are held together in paraffinoid compounds; consequently the use of the terms, “united by double bonds” and “by two affinities of each” is to be deprecated. The same may be said of the conventional method of formulating such compounds. Julius Thomsen has argued from his thermochemical observations that the two carbon atoms in ethylene are even less firmly united than are those in the corresponding paraffin ethane, and that the carbon atoms in acetylene have a negative affinity, but, as the writer has pointed out (*Phil. Mag.* Feb. 1887), the argument is based on a fallacy. In point of fact, although the ethenoid configuration is an unstable one, there is no reason to suppose that the carbon atoms are less firmly united than they are in ethane, but quite the contrary; the only conclusion to be safely deduced from chemical considerations is that the ethenoids are unsaturated, and in consequence capable of entering readily into interactions. The problem to be solved in connexion with them is the precise manner in which the carbon valencies operate effectively in such compounds; as yet we have no clue. A noteworthy property of the acetylenes is that of forming metallic derivatives—a property only observed in this class of hydrocarbons. It is commonly supposed that the hydrogen is directly displaceable by the metal, but it is more probable that it is only indirectly displaced, and that the formation of metallic derivatives from such hydrocarbons is an outcome of their highly unsaturated condition—not of any specific property of the hydrogen—which renders them capable of associating with metallic compounds. The formation of sodium acetylide, for example, may be represented in the following manner:—

In like manner it may be said that the displacement of the hydrogen in water by sodium is due to the attraction of the sodium by the oxygen, and merely a secondary phenomenon.

If the facts taught by the study of carbon compounds generally are considered from the point of view of the lessons they convey as to the valency of that **Complexity of carbon molecule.** element, and as to the manner in which carbon combines with carbon, it is clear that the immense variety of compounds may be referred to four simple types—the paraffinoid, the ethenoid, the acetylenoid and the benzenoid—the first two including both open and closed chain forms. In other words carbon atoms tend to combine—to exert their four units of affinity—in only four different ways. The maximum stability is attained in the cycloids, especially in benzenoids. When the tendency of carbon to form benzenoids of a high degree of complexity, and the great stability of these is taken into account, it appears to be almost a necessary consequence that the carbon molecule should itself be highly complex. Apparently it should be possible to “fuse” cycloid upon cycloid, much as cell may be added to cell in a honeycomb, and the stability of the system should increase rather than diminish with increased complexity, provided the conditions which obtain in a compound like anthraquinone

Ethenoid compounds.

are satisfied, *i.e.*, that the cycloids be so arranged as to give rise only to centric and saturated (paraffinoid) hexacycloids, and to exclude the formation of ethenoid rings such as presumably occur in anthracene. It is possible even to go farther, and from this point of view to explain the differences observed between the different forms of carbon. The diamond may well be a complex of the anthraquinone type, while both graphite and amorphous carbon may more nearly resemble anthracene in structure, the low stability of the former as compared with the latter being due to the presence in amorphous carbon of a greater number of ethenoid rings. Such assumptions would probably also serve to account for the colourlessness of the diamond, and for the opacity of the allotropic forms. For like reasons it is probable that amorphous carbon will be found to be the most, and diamond the least, refractive of the three forms. In order that the marginal affinities in a system of cycloids extending laterally may be satisfied, it is obviously necessary to assume that the cycloids may be arranged in two or more planes, *i.e.*, in layers. It is conceivable that in a system in which the marginal elements were all either centric or ethenoid, the marginal affinities to be satisfied would all lie in a single plane; but if the marginal elements were partly paraffinoid they would not all lie in a single plane. It is well known that the diamond as well as amorphous carbon at high temperatures is converted into graphite, which is the most stable of the three forms: it may well be that the change which takes place is that of a system of centric and paraffinoid elements into one in which the marginal paraffinoid elements become either centric or ethenoid.

The conception that the carbon atom may be symbolized by a tetrahedron affords an explanation of numerous cases of isomerism besides those in which an asymmetric arrangement of the radicles such as *Cis- and trans-isomerism.* would condition optical activity is to be postulated. In the case of ethenoid derivatives, in which a pair of carbon atoms are associated by two affinities of each, the affinities uniting the two atoms lie in one plane, whilst the remaining four affinities lie in a second plane at right angles to the first. Hence an ethenoid compound may be represented by $\begin{matrix} R_1 & \text{---} & R_2 \\ || & & || \\ R_3 & \text{---} & R_4 \end{matrix}$ such a symbol as is shown in the margin, in which the double vertical line indicates the "double bond" between the carbon atoms.

In such a case isomerism will arise if merely the position of R_3R_4 relatively to R_1R_2 be varied, the radicles lying in the one case on the same, and in the other on opposite sides of the plane uniting the two carbon atoms. Isomerides of this kind are not optically-active, as the radicles are all situated in one plane. So simple a difference in structure often involves a considerable difference in properties, as in the case of maleic and fumaric acids, for example. Of these the former alone yields an anhydride, and is therefore represented as the *cis*-form by symbol 1, fumaric acid, the *trans*-form being represented by symbol 2

Cis- and trans-isomerism occurs, it is supposed, not only among ethenoid compounds, but also in the case of saturated ring systems generally; in fact, the ethenoid compounds present but a special case of this kind of isomerism. In a ring system—whether composed of carbon atoms alone or of such in conjunction with other polyad elements—the affinities of the atoms which are united within the ring lie in the plane of the ring, and the two remaining affinities of each carbon atom lie in

planes at right angles to the ring plane. Numerous instances of this kind of isomerism are presented by the benzene-carboxylic acids, which have been studied more particularly by von Baeyer.

Enough will have been said to make clear the use that is made of the conception that the affinities of carbon are directed effects. The hypothesis has been of the utmost service, as with its aid it is possible to give a rational explanation of every case of isomerism hitherto described. But after all the model used is but a model, and probably a very imperfect expression of, if indeed it in any way approaches to, the actual state. There is little doubt that what is true of carbon is true of many if not of all the other polyad elements.

CHEMICAL CHANGE.

Chemical text-books teem with equations representing changes as occurring between *pairs* of substances, so that from the outset of his career the student becomes imbued with the notion that such expressions are faithful representations of the facts—especially as he witnesses many experiments in which *apparently two* substances are caused to interact; he is rarely made aware that the materials used are always more or less impure—that a *pure* substance in fact is, and must ever be, an ideal conception, and he is still less rarely led to reflect on the possible influence of "impurity" as causative of change. Yet, of late years, instance after instance has been brought forward of a "third substance" playing an all-important and indeed determinative part in conditioning the chemical interchange; so much is this the case that it is now seen to be more than probable that every interchange involves the co-operation of a "third" substance.

Many years ago Wanklyn stated (*Chem. News*, xx. 271) that dried chlorine is without action on sodium even when the latter is heated; but until Cowper pointed out, in 1883 (*Trans. Chem. Soc.* 1883, p. 153), that while dried chlorine is without action on copper and a number of other metals, the moist gas at once attacks them, the influence of moisture in promoting such interactions did not attract attention. In 1884 the important discovery was made by H. B. Dixon (*Phil. Trans.* 1884, p. 617), that a dried mixture of carbonic oxide and oxygen gases does not explode, but that a mere trace of steam renders it explosive, the rate at which the explosive wave travels in such a mixture being dependent, up to a certain point, on the amount of moisture present. H. B. Baker then showed (*Phil. Trans.* 1888, p. 571) that when moisture is, as far as possible, excluded, carbon, sulphur and phosphorus can be heated in an atmosphere of oxygen without undergoing visible combustion. Holt and Sims subsequently observed that dried oxygen does not oxidize either sodium or potassium (*Trans. Chem. Soc.* 1894, p. 432). In 1893 H. B. Baker extended his experiments to compounds, and made the very remarkable discovery that neither does oxygen combine with nitric oxide nor ammonia with hydrogen chloride when the gases are very carefully dried. The same observer has found that the reverse effect—the occurrence of decomposition—is also affected by the presence of moisture, it being possible, for example, to vaporize ammonium chloride and mercurous chloride without their undergoing decomposition if moisture be rigorously excluded. The utmost care, however, must be taken to secure such a result, it being necessary, for instance, in determining the density (by V. Meyer's method) to use an apparatus constructed of hard glass, since soft glass apparently retains sufficient moisture to invalidate the experiment. In some cases, although it has not been found possible to prevent the

occurrence of change, evidence that moisture exercises a determining influence is afforded by the observation that the rate of change is affected by the withdrawal of moisture. Thus Pringsheim, Dixon, and Baker have all found that the rate at which hydrogen and chlorine interact is diminished by carefully drying the gases. Experiments made by V. Meyer, in conjunction with Krause and Askenasy (*Liebig's Ann.* 264, p. 85; 269, p. 49), show that the same mixture of hydrogen and oxygen sealed up in a number of bulbs and heated to various temperatures behaved irregularly, interaction occurring in some to a far greater extent than in others placed under apparently the same conditions. Such results may be regarded as proof that even the interaction of hydrogen and oxygen is determined by a third substance.

But there are a number of cases in which the attempt has been unsuccessfully made to check the occurrence of change by removing moisture (cf. Cowper, *Apparent exceptions.* *loc. cit.*; H. B. Baker, *Trans. Chem. Soc.* 1894, p. 611); of none of these can it be asserted, however, that the precautions taken have been sufficient to preclude the assumption that with still greater care positive results would be obtained. Among the most, indeed the most, carefully conducted experiments of the kind are those of Shenstone on the production of ozone, and on the interaction of mercury and halogens (*Trans. Chem. Soc.* 1897, p. 471). According to this observer "well-dried oxygen ozonizes exceedingly badly," whence it may fairly be assumed that dry oxygen would not ozonize. On the other hand, when the well-dried gas was ozonized the ozone produced appeared to undergo decomposition very rapidly, while that produced when moist oxygen was used seemed to be stable. Shenstone therefore assumes that water vapour, at the ordinary temperature, retards the reversion of ozone to oxygen in a very remarkable degree. That this should be the case appears highly improbable, and it is necessary to seek for an explanation of the anomaly in some other direction. It is conceivable that a minute amount of "acid" impurity may intervene in the case of the dried gas and determine its decomposition, but that in the wet gas this impurity is rendered more or less harmless by condensation. Such impurity might be derived from the interaction of nitrogen and oxygen under the influence of the discharge, for it is known that "oxides of nitrogen" determine the decomposition of ozone. As regards the interaction of halogens and mercury, Shenstone was unable to detect any alteration in their activity consequent on drying. But when the complex character of his apparatus is taken into account, as well as the fact that it was not all made of hard glass, and that it could not be dried at a high temperature, it is more than probable that he was not able to carry the drying sufficiently far, especially when it is remembered how extraordinarily minute, according to H. B. Baker's later observations, is the amount of moisture required to induce decomposition in the case of mercurous chloride. Chlorine being a far more active agent than oxygen under ordinary conditions, it is to be expected that it will be far more difficult to check the occurrence of change when it is used than is generally the case with oxygen.

There can be little doubt that the evidence is sufficient to justify the conclusion that chemical interactions are not generally of the simple form

and that their occurrence is, as a rule, dependent on the introduction of some "third component" into the system. It is even probable that this is a rule absolute. If the attempt be made to determine the conditions which

must prevail in order that an interchange may occur, with a view of determining the nature of the "third component," the only conclusion at present possible is that they are essentially those *Nature of third substance.* which obtain in a voltaic circuit; in fact, if Faraday's doctrine of the unity of chemical and electrolytic change be accepted it follows that both are determined by like conditions. On this assumption, a circuit of change must comprise three distinct terms or components, one of which must be an electrolyte. On this view, it is easy to understand the occurrence of change in many cases on the introduction of moisture. It is only necessary to bear in mind that as we invariably operate in glass vessels which are to some extent soiled, it is impossible to avoid the presence of traces of acid or "salts," which render the water an electrolyte, and therefore that the introduction of moisture means the introduction of an electrolyte. Thus, in the case of the combustion of carbonic oxide, the system within which change occurs may be regarded as consisting of oxygen, carbonic oxide, and impure, *i.e.* conducting water, which conjoined form a conducting circuit within which the interaction occurs, *viz.* :—

As early as 1830 it was shown by de la Rive that the readiness with which zinc is attacked by an aqueous solution of sulphuric acid depends upon the amount of impurity it contains, and that the acid which acts most readily is that which has the highest electric conducting power. When purified as far as possible zinc is all but insoluble, and therefore it may fairly be supposed that ideal pure zinc would be insoluble in diluted sulphuric acid. It at once dissolves when coupled up with any relatively electro-negative conductor at a rate depending on the resistance in the circuit in which it is arranged and on the electromotive force developed in the interaction. The conditions which determine the dissolution of zinc may therefore be said to be that it forms one of the three components in a conducting circuit comprising itself, a relatively electro-negative chemically inert conductor, and an electrolyte which can exchange its electro-positive constituent for the zinc. The apparent inactivity of "pure" zinc has been ascribed to the circumstance that when placed in acid it immediately becomes coated with a protecting film of hydrogen—varnished, as it were—and that the part played by the impurity is that of depolarizer: that, in fact, it conditions the escape of the hydrogen. That the impurity, to some extent, exercises this latter function there can be no doubt; but, on the other hand, there is every reason to believe that three "components" are required to form a voltaic circuit. It is well known that the electromotive force of a zinc-sulphuric acid-couple (or triplet, to use a far more suitable expression) is a fluctuating value, and that the nature of the conductor is of some importance. Thus a cell containing a polished silver plate as positive element is less effective than one in which the plate is coated with finely divided platinum. It is not difficult to understand this, as the extent to which hydrogen escapes from the positive is much influenced by the character of its surface, and it is well known that finely divided platinum promotes the escape of gases from solution. Therefore when finely divided platinum is thus used, not only is the effect diminished which retention of hydrogen on the surface of the plate would have in increasing the resistance in the circuit, but the extent to which "polarization" or reversal takes place is also considerably diminished. In fact, it must not be forgotten that the action is a reversible one, *i.e.*,

Voltaic and chemical change correlative.

$\text{Zn} + \text{H}_2\text{SO}_4 \rightleftharpoons \text{H}_2 + \text{ZnSO}_4$, and that the extent to which reversal takes place depends on the power possessed by the positive electrode of conditioning the return of hydrogen into circuit.

In cells of the Daniell type a constant electromotive force is secured owing to the complete prevention of polarization and its consequences, but the depolarizer not only prevents back action and maintains the resistance constant by acting as a scavenger, but also always contributes to the development of energy in the circuit. Change, in fact, is often conditioned by the presence of a depolarizer, an exothermic series of changes being thereby converted into an endothermic series. Thus copper is insoluble in dilute sulphuric acid, its "heat of dissolution" in such acid being a negative value, which may readily be calculated from the known heat of formation of copper oxide and that of copper sulphate and water from the oxide and dilute sulphuric acid; thus

In presence of oxygen, however, the metal readily dissolves, the gas acting as the depolarizer,

A cell consisting of copper, dilute sulphuric acid, and oxygen, therefore, has an electromotive force of about $\frac{55960}{46000} = 1.2$ volts. Actually, copper sulphate is manufactured on a very large scale by the action of dilute sulphuric acid on granulated copper in presence of air.

In the case just considered, the third term of the system is not a substance which acts as a conductor in ordinary circumstances; but it is merely one which can become included in the system. It would therefore seem to be necessary, in order that chemical change may take place, that a circuit be established in a system composed of at least three "elements," which is conducting as a whole, and which contains, together with an electrolyte and a substance which sooner or later is attacked by the electrolyte, a third substance which may or may not take a material part in the change.

In the case of the combustion of carbonic oxide by moist oxygen, Dixon has argued that since carbonic oxide is inert towards oxygen, its oxidation in presence of moisture is a secondary effect, the steam acting catalytically as a carrier of oxygen. It is well known that at a high temperature carbonic oxide decomposes steam ($\text{CO} + \text{OH}_2 = \text{H}_2 + \text{CO}_2$), and Dixon supposes that the whole of the oxidation is effected in this way, the hydrogen being alternately oxidized and deprived of oxygen (*Trans. Chem. Soc.* 1898, p. 774). That a part of the carbonic oxide may be oxidized in this simple manner cannot be denied, but probably it is only a minor part; there must be some collisions in which only carbonic oxide and water molecules meet, but considering the proportions in which carbonic oxide and oxygen are present, it must frequently happen that their molecules will together collide with water molecules, in which case the interaction

$\text{CO} + \text{OH}_2 + \frac{\text{O}_2}{2} = \text{CO}_2 + \text{H}_2\text{O}$ is bound to occur; especially as it is a change in which heat is liberated, *i.e.* exothermic, whereas the interaction of carbonic oxide and water is one in which heat is absorbed, *i.e.*, endothermic. But apart from the question which is the preponderating change, they may equally be regarded as electrolytic changes, *i.e.*, as taking place only under the conditions which render the

occurrence of electrolysis possible—whatever these may be in the case of gases.

In order to test whether the high stability of the oxygen molecule renders a mixture with carbonic oxide inexplorable, and whether oxygen in the "nascent" state is more active, Dixon has made the interesting experiment of exploding a well-dried mixture of carbonic oxide and chlorine peroxide, the result being that much of the former remained unburnt just as when well-dried oxygen is used (*ibid.* 1896, p. 605). As it must be supposed that at the moment of explosion oxygen atoms are liberated, it might be expected that the oxygen from such a source should be specially active. On the other hand, when cyanogen is exploded with an excess of oxygen, it is entirely burnt to carbon dioxide, and Dixon supposes that the carbonic oxide formed in the wave front is slowly burnt behind the wave front. It should be mentioned that a spark of considerable intensity is required to initiate an explosion in such a mixture, and that the presence or absence of moisture apparently makes no difference in the readiness with which the mixture is inflamed. As it cannot be assumed that Dixon dealt with really dry gases, this probably means that a much smaller proportion of moisture suffices in the case of cyanogen to promote the interchange, and the completeness of the oxidation may be ascribed to the fact that cyanogen has a very high "heat of combustion." In the case of the explosion with chlorine peroxide, the chlorine would interfere by decomposing a portion of the water, and the effect of the atomic oxygen in promoting the change would be counterbalanced by the withdrawal of moisture. In general chemical behaviour, carbonic oxide is a far more saturated and less active substance than cyanogen, and water molecules would have less tendency perhaps to couple up with it than with cyanogen. It is desirable to call attention to this point in order to lay emphasis on the need, in discussing chemical interchanges, of taking into account both the compatibility of the various molecules present and the stability of the loose molecular complexes which may form prior to the occurrence of any interchange.

Although it may be said that a fairly general agreement exists to regard chemical changes as essentially electrolytic in their nature, there is far from being any agreement as to what really takes place—as to the character of the "mechanism" concerned in their occurrence. Williamson, in 1851, in his paper on the "Theory of Etherification," put forward in explanation of "the general process of chemical decomposition," the view that in an aggregate of molecules of any compound there is an exchange constantly going on between the elements which are contained in it. Thus in a drop of hydrochloric acid, supposed to be made up of a great number of molecules of the composition ClH , each atom of hydrogen does not remain quietly in juxtaposition with the atom of chlorine with which it first united, but on the contrary is constantly changing places with other atoms of hydrogen. Supposing the hydrochloric acid to be mixed with some sulphate of copper (of which the component atoms are undergoing a similar change of place), the hydrogen does not merely move from one atom of chlorine to another, but in its turn also replaces an atom of copper. Thus it is that at any moment of time at which we examine the mixture the bases are divided between the acids (*Quart. Journ. Chem. Soc.* 4, 110). Practically the same view was applied by Clausius in 1857 in explanation of the phenomena of electrolysis; but whereas Williamson had spoken only of exchanges going on, Clausius ascribed the occurrence of these to collisions taking place between the molecules of sufficient violence to cause some to split up into their constituents, which then wandered about till

**Gaseous
inter-
actions.**

they met with others of the opposite kind and united with them to form new molecules. On the assumption that the electromotive force acts on the molecular fragments during the intervals of freedom but does not produce disruption of the molecules, it is possible to understand that any electromotive force, however small, can produce sensible electrolysis.

Kekulé, in 1858, in discussing the manner in which interchanges are effected, took the very different view that in the first instance the molecules attract each other and become associated, and that atomic affinities then come into operation and cause the redistribution. He pictured the state of affairs in the following manner:—

He went so far as to speak of this conception as the simplest and as being universally applicable.

For many years practically no attention was paid to the dissociation hypothesis, and it was not until 1884 that interest was revived in it by Arrhenius, who gave a quantitative form to the hypothesis of Clausius by treating electrolytic conductivity as a measure of the extent to which dissociation may be supposed to have taken place in a solution. A still greater advance was made in 1887 by van't Hoff, who fully discussed the properties of solutions, and showed that the equations for the ordinary gaseous laws are equally applicable to solutions, provided that in the case of conducting solutions the increase in the number of molecules due to the "dissociation" be taken into account.

In the modern form of the hypothesis, substances which afford conducting solutions (acids, bases and salts) are assumed to undergo disruption or dissociation into separate ions *when dissolved* in water, the extent to which the ionic dissociation is effected depending not only on the substance, but also on the degree of dilution. Neutral substances, on the other hand, such as alcohol, sugar, &c., which do not behave as electrolytes in solution, are assumed to be undissociated. But ionic or electrolytic dissociation differs from ordinary dissociation—in which a compound is resolved into mutually independent simple molecules—in that the two ions into which the electrolyte is resolved are associated with opposite equal electric charges. These electric charges, like matter, are, in a sense, to be regarded as "atomic," a unit charge corresponding to a unit valency, so that each ion is capable of conveying only a certain charge; consequently the electric conductivity of a dissolved electrolyte is quantitatively proportional to the degree of ionization. The dissolved substance in its dissociated state—not the solution as a whole—is therefore the effective conductor. To deduce m , its *molecular conductivity*, the specific conductivity, k , of the solution is multiplied by v , the number of litres containing a gram molecular proportion of the substance. The molecular conductivities are, therefore, values which express the degree of conductivity due to the introduction of equal numbers of molecules of dissolved substances between the electrodes. If m_v be the molecular conductivity of a substance in a solution of dilution v , and m_∞ —deduced by extrapolation from the m_v values—that in an infinitely dilute solution, in the case of compounds of univalent ions, the degree of dissociation or ionization i_v in the solution of the concentration v and the molecular conductivity of the dissolved substance are so related that

$$i_v = m_v / m_\infty.$$

In the case of compounds containing multivalent ions a more complex relation obtains. In a system consisting of

water together with an undissociated substance and its ions, the ordinary laws of equilibrium govern the relation between the degree of dilution and the extent to which the substance undergoes dissociation; therefore, in the simplest case, that of a binary electrolyte E, the two ions of which are A and B, if e , a , and b are the molecular concentrations of the undissociated material and of its two ions respectively,

$$ab = eK, \text{ and } a = b$$

where K is a constant. If the total quantity of dissolved material be taken as unity and the dissociated fraction as i ,

$$a = b = i/v \text{ and } (1 - i)/v = e.$$

The relation between the degree of dissociation and the dilution is therefore that expressed by the formula

$$i^2 / (1 - i) = Kv.$$

Effect of dilution on degree of dissociation.

The case of dichloroacetic acid may be cited as one in which, as van't Hoff points out, the agreement between the calculated and observed results is especially close.

Whereas carboxylic acids generally are but slightly dissociated in moderately dilute solutions, strong mineral acids, the alkalies, and most metallic salts—especially those of alkali metals—are highly dissociated. This is well shown in the following table of results originally published by Ostwald in 1885, in which the molecular conductivities are given in arbitrary units:—

v .	HCl.	HBr.	HI.	HF.	Nitric Acid.	Sulphuric Acid.
2	77.9	80.4	80.4	...	77.9	92.7
4	80.9	83.4	83.2	6.54	80.4	96.4
8	83.6	85.1	84.9	7.59	82.8	100.6
16	85.4	86.6	86.4	10.00	84.9	107.4
32	87.0	87.9	87.6	13.14	86.3	116.3
64	88.1	88.9	88.7	17.38	87.4	127.3
128	88.7	89.4	89.4	23.11	88.2	139.2
256	89.2	89.6	89.7	30.30	88.4	150.6
512	89.6	89.7	89.7	39.11	88.8	160.9
1,024	89.5	89.5	89.3	49.49	88.9	169.1
2,048	89.5	88.9	89.0	59.56	88.2	174.4
4,096	88.6	87.6	87.8	69.42	86.6	177.1

It will be noticed that in the case of the three halohydrides, for example, a steady value is very soon reached, dissociation being practically complete at very moderate dilutions, in comparison with those necessary to produce anything like the same degree of change in the case of dichloroacetic acid quoted above. Moreover, the initial value differs but slightly from the final value—which is an indication that the acids are almost completely dissociated even in concentrated solutions; in fact, if 90 be taken as the limiting value, in the case of the halohydrides, HCl, HBr, and HI as well as in that of nitric acid, about 80/90 = 9 of a molecular proportion of the electrolyte is resolved into its ions when dissolved in only 2 litres of water. The different behaviour of hydrogen fluoride is of interest, as this hydride, it is well known, tends to form complex aggregates; apparently these only gradually undergo simplification on dilution, and consequently the electro-

lytic dissociation of the fundamental molecules is considerably retarded. A striking illustration of the influence of composition on the extent to which dissociation takes place is afforded by the substituted acetic acids, thus:—

	i ($v=1000$)	$K \times 10^5$
Acetic acid . . .	0.125	0.0018
Chloracetic acid . .	0.692	0.155
Dichloracetic acid .	0.981	5.1
Trichloracetic acid .	0.999	121.0

It is generally noticeable that the value of the dissociation constant K is subject to great variation as the structure changes; consequently this factor becomes of great importance in diagnosing the structure of electrolytes.

Ethereal salts, cane sugar, and other substances which undergo hydrolysis in presence of acids and alkalies are acted upon at rates which differ not only as the conditions of temperature and concentration are varied, but also according as the change is conditioned by the one or the other hydrolyst. Investigation shows that the relative activity of hydrolysts corresponds with the electric conductivity of their solutions; hence it is assumed that acids, &c., do not act as such in these cases, but that the ions are the active agents. From this point of view, the constant K is the measure not only of the extent to which a substance is dissociated, but also—with certain limitations—of its activity in chemical interchanges. The following results obtained by Ostwald with cane sugar may be cited as proof that the rate at which inversion is effected by the acids referred to, in comparison with that deduced for hydrogen chloride (in $\frac{1}{2}$ normal solution at 25°), is almost proportional to the degree of dissociation:—

	Rate of Inversion.	Degree of Dissociation.
Acetic acid . . .	0.0040	0.006
Formic acid . . .	0.0153	0.0245
Monochloracetic acid .	0.0484	0.0542
Dichloracetic acid .	0.271	0.272

As the hydrolysis of cane sugar is effected only by acids and not by alkalies or salts, it is customary to regard the action as brought about solely by the hydrogen ions, which are abundantly present in most acid solutions, but not in those of alkalies and salts. It should be noted, however, that although it is true, especially in the case of weak acids, that acids act the more readily the more highly they are dissociated, there is only a roughly approximate numerical proportionality between the inversion velocity and the quantity of hydrogen ions. It is also noteworthy, and difficult to explain, that the catalytic activity of the hydrogen ions is greatly stimulated by the presence of other ions; thus on adding to an acid solution an equivalent proportion of the corresponding potassium salt, the velocity of inversion is increased by some 10 per cent. in the case of strong acids, although it is decreased in the case of the weaker acids.

The ionic dissociation hypothesis is held to afford a simple explanation of the phenomena underlying the processes in use in analytical chemistry. Thus it is well known that the tests applied in detecting metallic and also non-metallic radicles are, with few exceptions, of general application—a metal,

Ionic hypothesis applied to chemical analysis.

for example, being detected by the same test whatever the salt may be in which it is present as positive constituent. This must be the case, on the ionic hypothesis, as the chemically active components in a solution are not the dissolved substances, but the ions into which they are resolved on entering into solution. The state of a salt AB is such that the undissociated salt and its ions A and B are in equilibrium; a second salt CD also exists in solution partly as CD and partly as the ions C and D. On mixing two such solutions interchanges occur, and a

new state of equilibrium is established in which the salts AD and CB also exist along with AB, AC, A, B, C, and D. The new salts are produced in quantities determined by the concentration, and if the solution be sufficiently dilute, the salts AB, AD, CD, CB are present in negligibly small quantities; consequently the properties of the solution are simply the properties of the dissolved ions, and there is no appreciable change on mixing AB with CD. But this is only true if the products are soluble. If the ions A and D are capable of uniting to form a substance which is insoluble under the conditions of the experiment, the compound AD is removed from the system as rapidly as it is formed, until eventually, when equilibrium is attained, only a very minute proportion of the ions A and D remains in solution. The effect on each other which two electrolytes having an ion in common often exercise by the one diminishing the solubility of the other is easily understood from this point of view. In the case of a saturated solution of a salt AB, the solid present is in equilibrium with the undissociated dissolved salt AB, which, in turn, is in equilibrium with its ions A and B; if now another salt containing either the ion A or the ion B be brought into the solution, the extent to which AB undergoes dissociation is reduced, because the proportion in which the one or the other of its ions is present in the liquid is increased. Consequently AB is partially thrown out of solution. The precipitation of sodium chloride on saturating its solution with hydrogen chloride, and the fact that the solubility of barium sulphate in water is reduced by the addition of either sulphuric acid or barium chloride, may be instanced as cases to which this explanation is applicable. The same principle is applicable in explanation of the lowering of the activity of weak acids by their salts. The fact that chlorine in chlorates, iron in ferrocyanides, &c., are not to be detected by the "ordinary" tests, is ascribable to the fact that they are not present in solution as simple ions, but as complex ions having altogether different and peculiar properties.

The considerable evolution of heat which occurs in neutralizing an acid by an alkali is apparently a contra-vention of the rule that practically no change occurs on mixing solutions of highly dissociated substances if there be no insoluble product. This, however, is held to be due to the fact that water itself is peculiar in being dissociated only to a very minute extent. Consequently water is the one product formed in the solution, and the heat evolved is to be regarded as that liberated by the combination of its constituent ions, thus:

In the case of all strong (*i.e.*, highly dissociated) acids and bases, therefore, the character of the change is independent of the nature of the acid and base. This conclusion is in striking accord with the well-known fact that the strong acids and alkalies all have practically the same heat of neutralization (*cp. Ency. Brit.* vol. v. p. 487). Further evidence of the same kind is afforded by the observation that in dilute aqueous solution all the metallic salts of a strong optically-active acid, such as bromocamphorsulphonic acid, have the same molecular rotatory power, *viz.*, that of the acid ion.

If water be regarded as very slightly dissociated, it is also easy to understand that it should act as a weak acid towards salts of very feeble acids and bases, which, in solution, undergo dissociation to an extent comparable with the degree of dissociation of water; in such cases, the ions A and B of the salt should combine with those of water, and recognizable quantities of the acid and base

derivable from the salt should be produced. The fact that solutions of cyanides smell of hydrogen cyanide is traceable to this cause. Another illustration is the liberation of the very weak base ammonia on boiling solutions of ammonium salts.

The study of ionic or electrolytic dissociation, and of the properties of solutions generally, in the main, involves the investigation of homogeneous equilibria, the principles governing which have long been familiar in connexion with the laws of mass action, developed by Harcourt and Esson (1866), and Guldberg and Waage (1867). The discussion of the facts relating to the saturation of solvents with dissolved matter is, however, now recognized as lying within a totally distinct province, and as involving the consideration of heterogeneous systems. Neglect of this fact has proved a constant source of error in the past, while its recognition has led within recent years to far-reaching and fruitful generalizations. The subject has received very full treatment at the hands of van't Hoff in his *Lectures on Theoretical and Physical Chemistry*. Formerly it was the custom to talk of a solution as being saturated with a certain dissolved material, but it is now recognized that it must be spoken of as saturated with respect to a particular material. The distinction lies in the fact, not formerly appreciated, that for a solution to become saturated it must be in contact with undissolved material. For example, on shaking water with excess of sodium chloride at 14°, each 100 parts of water dissolve 35.87 parts of sodium chloride, and being in contact with the solid salt, the solution is both in equilibrium with, and saturated with respect to, the solid. If the solution be separated from the solid it can no longer be described as a saturated salt solution, because it is no longer in contact with, and consequently not in equilibrium with solid sodium chloride. This modern method of regarding a state of saturation as a condition of equilibrium in a heterogeneous system, i.e., one in which there are at least two regions of different composition or concentration, leads immediately to a rational explanation of the phenomena of supersaturation which long perplexed chemists. Two cases

Super-saturation.

may be cited in illustration. It is possible to dissolve 40 parts of sodium sulphate in 100 parts of water at 30°, and on cautiously cooling the solution to 10° no separation takes place, although at 10°, in contact with the salt, water will only take up 9 parts of sodium sulphate per 100 parts. The solution containing 40 parts of the salt at 10° is commonly said to be *supersaturated*, but it cannot even be said to be saturated in the modern sense of the term. On dropping into it a fragment of the decahydrated salt, this salt at once crystallizes out, heat being evolved, and when, eventually, the temperature is reduced to 10°, the solution contains only 9 parts of the salt in 100 of water; this is because equilibrium has been established between solid and solution. Similarly, the solubility curve of sodium sulphate in water exhibits a break at 33°. The existence of this was long regarded as anomalous, but it occurs because below 33° the solid in contact with the saturated solution is the compound $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$, whilst above 33° it is the anhydrous sulphate. The hydrated salt decomposes at 33°, losing its water, and this temperature is therefore termed the *transition temperature*. At the transition temperature the solution is in contact and in equilibrium with both hydrated and anhydrous salt.

In the case of two salts capable of forming a double salt the conditions are somewhat more complex. The results obtained by Trevor (at 25°) with potassium and copper sulphates may be quoted in illustration. If the solution be in contact with the two salts and be saturated with

respect to each, it contains 5.2 per cent. of potassium, and 10.4 per cent. of copper sulphate. But if, instead of being in equilibrium with the single salts, it is in contact only with the double salt $\text{K}_2\text{SO}_4 \cdot \text{CuSO}_4 \cdot 6\text{H}_2\text{O}$, it contains 11.14 per cent. of the salt in solution. Lastly, the solution may be saturated with respect to the double salt and either of the single salts. At the same temperature, therefore, four different conditions of saturation equilibrium are possible, the condition which obtains depending solely on the salts in contact with the solution. If the temperature be also varied, the conditions become still more complex, owing not only to the changes in solubility, but also because alterations may take place in the degree of hydration and in the composition of the double salts. Thus, in the case of potassium and magnesium sulphates in solution at different temperatures, the conditions under which equilibrium obtains vary according as they lead to the separation of one or other of the compounds H_2O (as ice), K_2SO_4 , $\text{MgSO}_4 \cdot 6\text{H}_2\text{O}$, $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$, $\text{K}_2\text{SO}_4 \cdot \text{MgSO}_4 \cdot 6\text{H}_2\text{O}$, or $\text{K}_2\text{SO}_4 \cdot \text{MgSO}_4 \cdot 4\text{H}_2\text{O}$.

It should be pointed out that the great advance made in recent years in studying problems such as those just referred to is mainly due to the application by Willard Gibbs of the second law of thermodynamics to the study of the physical equilibria underlying chemical changes. It is characteristic of the results arrived at with the aid of this law, that they deal only with the difference in condition obtaining between the various parts of a system, and their validity does not depend upon the differences being of any particular chemical or physical type. The principles governing heterogeneous equilibrium have been formally expressed by Willard Gibbs in the so-called *phase rule*. This rule, however, is merely a convenient method of classifying the various cases of equilibrium which may arise, and in itself is of little use in diagnosing the conditions which hold in any particular case. Nernst has applied the principles enunciated by Willard Gibbs with signal success to the consideration of the equilibrium established when a soluble substance is distributed between two practically immiscible solvents in contact. For example—on shaking small quantities of succinic acid with a mixture of ether and water, the ratio $\frac{C_1}{C_2}$ of the amount of acid taken up by the

Solutions of double salts.

Distribution coefficients.

unit volume of ether, C_1 , and of water, C_2 , respectively, is found to be independent of the total concentration. This is known as the law of constant distribution coefficient. In the form given, it is obeyed only when the dissolved material has the same molecular weight in both solvents. On taking benzene, water, and benzoic acid, which consists of double molecules in benzene solution, the distribution of this acid takes place in such a manner that $\frac{C_1}{\sqrt{C_2}}$ is constant, C_1 being the amount of acid taken up by the unit volume of water, and C_2 that taken up by the benzene. The study of distribution coefficients, therefore, affords valuable information as to the molecular weights of substances in different liquid solvents. Its application to electrolytes in water and in non-dissociating liquids has furnished evidence supporting the electrolytic dissociation hypothesis. The method may even be applied to solids. In the case of isomorphous mixtures it affords evidence that these may properly be regarded as solid solutions of the one substance in the substance with which it is isomorphous. Thus thallium and potassium chlorates are isomorphous, and on crystallizing thallium chlorate from an aqueous solution containing a small proportion of potassium chlorate crystals of the former containing a small proportion of the potassium salt are deposited. Judging

from the ratio in which the potassium chlorate becomes distributed between the solid solvent (TiClO_3) and the liquid, it appears that the molecular weight of potassium chlorate is the same in both the liquid and the crystalline condition.

One of the most brilliant and fruitful generalizations of recent times has been van't Hoff's extension to dilute solu-

Extension of gaseous laws to solutions. tions of the well-known laws connecting pressure, volume, and molecular weight in gases. Although a liquid exerts no pressure other than that due to its mass upon the surface of a containing vessel, the existence in solutions of a state comparable with that which obtains in gases becomes evident on studying the phenomena of liquid diffusion. If, for example, a solution of sugar be enclosed in a vessel having semi-permeable walls—i.e., permeable by the water, but not by the dissolved substance,—and then the vessel be placed in water, diffusion of water into the solution sets in and continues until a certain pressure is attained: this is termed the *osmotic pressure*, and is found to be proportional to the number of molecules dissolved in the unit volume of liquid. Variations in temperature affect osmotic pressure in the same way that they affect gaseous pressure, consequently Avogadro's theorem is directly applicable to dilute solutions; in other words, equal volumes of dilute solutions (of any one solvent) under like conditions of temperature and osmotic pressure contain equal numbers of molecules. If osmotic pressure could be easily measured, a simple method of determining the molecular weight of dissolved substances would be to determine the osmotic pressures they develop; but, unfortunately, this is not the case, and the determinations are affected by considerable experimental errors. But there are certain properties of dilute solutions which can be easily measured which vary *pari passu* with the osmotic pressure. It has long been known that aqueous solutions of equimolecular concentration of salts such as sodium chloride, potassium chloride, &c., deposit ice when cooled to the same temperature, and van't Hoff has shown that the depression of the freezing-point of a solvent by addition of small proportions of a soluble substance is proportional to the variation in the osmotic pressure. The law that the freezing-point of a solvent is depressed to an extent proportional to the number of molecules of dissolved salt present in unit volume forms the basis of the now well-known freezing-point method of determining the molecular weight of dissolved substances. In a similar manner the vapour pressure of a solvent is lowered by the presence of dissolved material to an extent which is proportional to the osmotic pressure, and in weak solutions the decrease in vapour pressure is directly proportional to the rise in boiling-point of the solvent. On this is based the now familiar method of determining molecular weights by observing the rise in boiling-point of a solvent produced when known small amounts of soluble substances are dissolved in it. Both methods afford anomalous results when applied to aqueous solutions of electrolytes; but these meet with an explanation when the diminution in average molecular weight, i.e., the increase in the number of active molecules, consequent on the occurrence of ionic dissociation, is allowed for.

The ionic dissociation hypothesis is undoubtedly a conception of great beauty, and the success that has attended its application in the case of dilute solutions is of the most striking character. But it would be unscientific to yield to its charms without having fully considered the probability and sufficiency of the explanation which it affords, and the difficulties which stand in the way of its acceptance. Chemistry is so wide a subject, chemical phenomena are so complex and so hard to analyse and interpret, the difficulty of giving a quantitative expression to them is so

great, that chemists are but rarely prepared to undertake such a discussion; and it is easy to accept guidance and to yield allegiance to high authority, especially when it is exercised in the most autocratic and dogmatic manner possible hitherto. Unfortunately the advocates of the dissociation hypothesis have declined even to consider the objections which may be raised against it from the chemist's side.

One of the most fundamental objections to the hypothesis is that the number of compounds which are *per se* electrolytes being limited—to only a few fused salts, in fact—the explanation it affords of the occurrence of chemical change is at best only a very partial one. Water and all other liquids appear to be non-conductors in the pure state, and the arguments on which the assumption is based that water is dissociated to a very slight extent all involve reasoning in a circle. Pure water—a *pure* substance—is and must ever be an ideal conception; but as the resistance which water opposes to a current of electricity gradually increases as it is purified, and at last becomes enormously high, the facts warrant no other assumption than that it would be a non-conductor in the simple and pure state. The arguments based on the observation that it is slightly active chemically are of no independent value, since an impurity which would condition conductivity would equally condition chemical activity. The assumption which is made, in order to explain the constancy in the heat of neutralization of strong acids generally by alkalis, that water is only very slightly dissociated, involves a sharp distinction between water and other compounds, and consequently between oxygen and other elements, which is in no way warranted and is in opposition to the periodic generalization. It is generally recognized that oxygen and the halogens present many analogies, so that water should—and does—in many ways resemble the halhydrides; to assume, therefore, that water resists “ionic” dissociation whilst hydrogen chloride suffers almost complete disruption into “ions” is altogether unjustifiable and illogical.

When water is mixed, say with hydrogen chloride, a non-conductor *per se*, a solution is obtained which is readily electrolysed. But solvents generally do not act in this manner—in fact, only a limited number have the power of forming conducting solutions, and none is so active as water. To account for the influence of the solvent, F. Kohlrausch, in 1875, put forward the view that the ions which Clausius assumed to be present in a liquid are thereby prevented from coming too frequently into contact and merely recombining, and that consequently they are free during a sufficient length of time to be amenable to the guiding influence of the electromotive force. Parenthetically it may be pointed out that the dissociation postulated by Clausius was supposed to affect only a relatively small number of molecules at any one moment, whereas the dissociation postulated by the ionic hypothesis, in the case of strong acids and metallic salts, affects the major proportion of the molecules. Moreover, the process supposed to attend dissolution is one of a most extraordinary character; it may be likened to the case of a number of individuals jumping into a swimming-bath, and nearly all of them instantly parting with their arms and legs. If the solvent act as a mere screen, any solvent should suffice to render a potential electrolyte a conductor, but this is not the case. Moreover, as a number of substances when fused (silver chloride, stannous chloride, &c.) are conductors in the absence of any solvent, the screen hypothesis is not only an unsatisfactory and incomplete explanation of the facts, but its introduction appears to be uncalled for. Again, if the Clausius hypothesis be accepted, and it be assumed that some of the molecules in a liquid collide with sufficient violence to bring about their decomposition, it is to be expected

Peculiar influence of water.

that this would happen in liquids generally, although to different extents. Nor is it clear why the disruption should be of so partial a character, and lead only to the production of ions in the case of complex molecules; for example, acetic acid, *ex hypothesi*, is resolved only into H and $C_2H_3O_2$, instead of the molecule being more or less shattered to pieces. From this point of view it is impossible also to understand why only protochlorides and not perchlorides are electrolytes.

The discovery that chemical interchanges are in many cases not of the form $AB + CD = AC + BD$, but require the intervention of a third substance—the presence of an electrolyte being a *sine quâ non*—and that this is probably equally true of decompositions and isodynamic changes, indeed of every case of change, is almost conclusive evidence against the acceptance of the dissociation hypothesis either in the form suggested by Williamson or in that suggested by Clausius; in fact, no satisfactory evidence has been adduced that molecules are *per se* intrinsically so unstable as is suggested, or that they are in the habit of colliding with such violence as to smash each other to pieces.

As solvents generally do not condition electrolysis, but only particular solvents, it must be supposed that the solvent exercises a definite influence, and one which is not of a merely mechanical order¹; and that the molecules of solvent and solute in some way influence each other, and interact so as to pull each other to pieces as it were—in other words, that electrolysis is a dependent process. It is not a little remarkable that Faraday's prescience guided him to such a conclusion as the following passage (§ 523) in his fifth series of researches shows:—

The theory which I have ventured to put forth (almost) requires an admission that in a compound body capable of electrochemical decomposition the elementary particles have a mutual relation to and influence upon each other, extending beyond those with which they are immediately combined. Thus, in water, a particle of hydrogen in combination with oxygen is considered as not altogether indifferent to other particles of oxygen, although they are combined with other particles of hydrogen; but to have an affinity of attraction towards them which, though it does not at all approach in force under ordinary circumstances to that by which it is combined with its own particle, can, under the electric influence exerted in a definite direction, be made even to surpass it. This general relation of particles already in combination to other particles with which they are not combined is sufficiently distinct in numerous results of a purely chemical character . . . and it probably has a direct relation to and connexion with attraction of aggregation both in solids and fluids. It is a remarkable circumstance that in gases and vapours, where the attraction of aggregation ceases, there likewise the decomposing powers of electricity apparently cease, and there also the chemical action of quantity is no longer evident. It seems not unlikely that the inability to suffer decomposition in these cases may be dependent upon the absence of that mutual attractive relation of the particles which is the cause of aggregation.

In fact, when the phenomena generally of chemistry—and not merely the isolated behaviour of electrolytes—are taken into account, there can be little doubt that chemical changes are primarily associative and not dissociative in character, as was seen by Faraday; and that the force at work by which they are initiated is in all probability that which has been termed residual affinity. That this has not been more commonly recognized probably arises from the circumstance that it has been customary as a rule only to consider the end results of chemical operations. The view taken by Kekulé as to the manner in which chemical change is brought about needs but slight alteration to be in

harmony with such an argument; it is merely necessary to assume that when the complex formed by the association of the interacting or potentially interacting substances meets with the necessary third component, a conducting system is established, and that so soon as this is formed the change sets in. Residual affinities are in all probability the *polarizing* forces at work in such cases, by which the various components are led to associate and take up compatible positions. This hypothesis involves the assumption that complication, not simplification, precedes chemical change; that complex molecular systems are first formed from the interacting substances, and that these, on breaking down, suffer rearrangement of the parts—such rearrangement taking place in consequence of elements which were previously separate being brought into one common "sphere of activity" within which it is possible for them to interact. The function of condensing and other agents—of catalysts generally—on this hypothesis is that of collecting into one system the various elements necessary for the occurrence of a particular change. Such systems may be regarded as, and in fact would be, closed voltaic circuits. The action of aluminium chloride, for example, in conditioning the formation of homologues of benzene from the two substances benzene and methyl chloride—both undoubtedly dielectrics, which when together alone are entirely without action on each other—may be ascribed to the formation of an unstable compound of both with the metallic chloride. In like manner ferric chloride probably conditions the interaction of bromine and benzene by combining with both, and so bringing them within each other's range in an unstable system.

Ordinary cases of chemical change differ from those effected by an electric current merely in being cases of exothermic change which take place without any energy being supplied from without. How the current acts in promoting disruption cannot apparently at present be determined, but it is highly probable that it circulates within complex systems such as have been referred to. A rasping contact may be said to exist between the molecules of the dissolved substance and the solvent, and the action of the current upon each complex may be roughly compared with that of a dredging machine scraping mud from the bottom of a stream. A number of such dredgers arranged in series, each one of which picks up the mud delivered by the machine below, and thus carries it a stage higher up, so that mud only is visibly delivered at the one end of the system, may be taken as a simile of the manner in which the transport of the negative ion is effected; the water taken up in the buckets, but returned into the stream down which it flows, corresponds to the positive ion. But although both are concerned in the process, it cannot at present be determined whether the water or the dissolved substance in an aqueous solution is primarily split up; it is doubtful whether either is ever at once separately resolved into its ions. Probably in the first instance the system is resolved into two parts, one of which escapes—unless it act on the water—while the other being unstable often gives rise to secondary products. A solution of sulphuric acid, for example, appears to yield hydrogen and "oxidized sulphuric acid"; the extent to which this latter persists depends entirely on the conditions, *i.e.*, the concentration, the temperature, and the size and character of the electrode. That water should be the most active among liquids both as a solvent and in promoting electrolysis is in no way surprising, as no other compound exhibits residual affinity in so high a degree. To account for the behaviour of conducting chlorides, it is only necessary to suppose that individual like molecules exercise among themselves an influence similar to that exercised in

¹ It has been contended of late that the superior influence of water is due to its high specific inductive capacity. It is more probable that the power of water to condition electrolysis and its high specific inductive capacity are but correlated properties which have their origin in the high residual affinity of the oxygen.

other cases between the molecules of solvent and solute. The existence of compounds such as potassium triiodide renders it probable that the electrolysis of conducting chlorides, such as silver chloride, is conditioned by the attraction which they exercise for chlorine, and the behaviour of protochlorides in comparison with that of perchlorides is readily explained from this point of view.

Among the objections to the ionic hypothesis in explanation of chemical change, that afforded by the behaviour of enzymes as hydrolytic catalysts is one of the strongest. The hydrolysis of ethereal salts and of carbohydrates such as cane sugar by acids is supposed to be conditioned by the hydrogen ions, but enzymes—which act even more powerfully than acids on the carbohydrates—are not electrolytes, and therefore cannot be supposed to furnish hydrogen ions. Moreover they act selectively, a particular carbohydrate as a rule being hydrolysed only with the aid of a particular enzyme; in fact, there must be a correspondence somewhat like that of key to lock, and there is no doubt that the geometrical configuration of the enzyme relatively to that of the carbohydrate is the determining factor on which its action depends.

Although it is unquestionable, however, that besides being in many respects incompatible with the facts and irrational, the ionic dissociation hypothesis makes demands upon the imagination which it is practically impossible to grant, it is equally beyond question that the substances classed as electrolytes in effect behave as though they were dissociated in solution. What is the explanation of this remarkable circumstance? Can any rational process be imagined comparable with that of ionic dissociation and susceptible of similar treatment? Such an explanation is perhaps not far to seek, and may be found in the fact—too commonly overlooked—that in solvents generally there are always present two sets of molecules in equilibrium, viz., simple or fundamental molecules and complex aggregates formed by the association of several such simple molecules. The internal state of a mass of liquid must be pictured as one of intense activity and turmoil—as one in which dissociation is constantly going on, but inter-molecular, not intra-molecular or ionic dissociation. Liquid water, for example, is a mixture of fundamental molecules or *monads* such as are represented by the symbol OH_2 with complexes formed by the union of several of these simple molecules, in proportions depending on the temperature, and these two kinds of molecules are ever changing backwards and forwards the one into the other. The monads are presumably the chemically active molecules, but the complexes have little if any chemical activity. If it be assumed that chemical change and electrolytic conduction in liquids are dominated by the process expressed in the equation of equilibrium

$$M_x = xM,$$

M being the symbol of the fundamental molecule or monad, any condition which increases the proportion of monads will render the solvent more “active.” The effects produced on dissolving non-electrolytes are wrongly attributed to the dissolved substance; they are in reality due to the solvent monads, and it is the solvent, not the dissolved substance, that alone undergoes alteration in the case of substances which enter into solution as monads. Thus, to take the case of the osmotic pressure developed on dissolving any non-electrolyte in water—if a vessel containing water be divided into compartments by a permeable diaphragm, the equilibrium will be the same on either side, and therefore the pressure will be the same. But if a substance which cannot penetrate the diaphragm be dissolved in the water in the one compartment, its

molecules will interpose themselves as screens between those of the solvent, and prevent the reassociation of the monads; consequently these will be present in a greater proportion in the solution than in water. The monads will necessarily exercise an attractive influence over those in and beyond the walls of the diaphragm, and a flow will take place into the compartment containing the dissolved substance until equilibrium is restored. The osmotic pressure developed is therefore a measure of the extent to which the dissociation of solvent complexes into monads takes place. All substances which enter into solution as monads, if non-electrolytes, should produce the same effect when present in equimolecular proportions under like conditions of temperature and pressure—and Avogadro's law should therefore hold for dilute solutions. This is the well-known classic conclusion formulated by van't Hoff. In the case of associated non-electrolytes a disturbing factor is introduced if the molecule only gradually undergo dissociation into monads as dilution proceeds, and the behaviour of such compounds must be irregular. The depression of the freezing-point and the rise in boiling-point brought about by dissolving a substance in a liquid are necessary consequences of the presence of an increased proportion of monads.

Electrolytes, besides acting as mere mechanical screens, also exercise a specific influence in excess of that exercised by non-electrolytes, by themselves combining with solvent molecules. In such cases an attractive influence is exerted not only between the solvent monads, but also between these and the solute monads. If it be granted that electrolysis is the outcome of an interaction of the fundamental molecules of solvent and solute under the influence of an electromotive force, there is no difficulty in understanding the apparent increase in conductivity of electrolytes as the solution is diluted. The apparent effect produced by a dissolved substance must be greatest in a highly dilute solution, because in such a solution the solute is resolved to the maximum possible extent into its fundamental molecules, and these come most fully under the influence of the solvent monads, which are then necessarily present in maximum proportion.

From the point of view of the hypothesis here developed ions need have no separate existence, and the phenomena exhibited by solutions—whether physical or chemical—are mainly influenced by changes in the molecular composition of the solvent, the chief if not the only factor by which the changes are conditioned being the obscure function of the atoms termed residual affinity.

It will be appropriate to introduce here a brief reference to the nature of the chemical interchanges involved in vital processes, whether in plants or animals. Owing to the great advance in our knowledge, especially of synthetic processes, it is possible to form some conception of their general character, although such changes are necessarily to a great extent enshrouded in mystery. In the main they are of four kinds—reductive, synthetic, hydrolytic, and oxidative. It is generally believed that the first stage in assimilation involves the reduction of carbon dioxide under the influence of light, and that it proceeds *pari passu* with the separation of oxygen, somewhat in the manner formulated in the equation: $\text{CO}_2 + \text{H}_2\text{O} = \text{COH}_2 + \text{O}_2$; it is difficult, however, at present to regard this as more than a mere statistical expression. To judge from its properties, chlorophyll belongs to the class of quinones. But a quinone cannot cause reduction; on the contrary, it acts as an “oxidizing” agent in consequence of the readiness with which it combines with hydrogen, forming a hydroquinone or quinol. It is, therefore, probable that chlorophyll first undergoes reduction at the expense of some

*Chemistry
of vital
processes.*

easily oxidizable substance, and that the reduction of carbon dioxide is effected, wholly or in part, by the quinol of chlorophyll—one at least of these changes taking place under the influence of light. Assuming that formaldehyde, CH_2O , is the immediate product, it is highly probable that this is at once converted into a carbohydrate—in many cases into starch. To appreciate the importance of this change, it is necessary to consider the phenomena of

Fermentation.

fermentation; it is then obvious that the energy stored up in the carbohydrate system plays an all-important part. Fermentation is certainly at bottom a process of *hydrocatalysis*, and it can scarcely be doubted that the function of the enzyme is to introduce water into the circuit of change—to establish a circuit in which hydrolytic changes can occur, although not of the ordinary kind, but reductive on the one hand and oxidative on the other. Baeyer, in 1870, was the first to point out that the resolution of glucose during fermentation into alcohol and carbon dioxide, and, indeed, the phenomena of fermentation generally, may be accounted for by the assumption that translocation of hydrogen and oxygen atoms is induced through the alternate separation of the elements of water and their addition in a different order—changes which would involve the accumulation of oxygen atoms at certain parts of the molecule, thus constituting points of weakness where disruption of the molecule would inevitably occur. This is shown in the following formulæ, in the second of which the separating elements are indicated by dots:—

It will be seen that in the product of rehydration (III.), the terminal groups are fully reduced, whilst there has been an accumulation of OH groups in other parts of the system. In a molecule so constituted, changes might set in similar to those involved in the resolution of oxalic acid into carbon dioxide and formic acid.

The conception is one of remarkable beauty, and undoubtedly a sufficient explanation, as changes precisely similar to those attending fermentation may be effected by simple hydrolysis. Thus glucose may be converted into lactic acid by heating it with alkali, and on boiling fructose with muriatic acid an acid is formed, *i.e.*, lævulinic acid, $\text{CH}_2\text{CO.CH}_2\text{CH}_2\text{CO}_2\text{H}$, the production of which clearly involves a reduction of some of the CH_2OH and CH.OH groups, and oxidation of others, in the manner pictured by Baeyer. The changes attending fermentation are presumably functions of the protoplasm—in other words, they probably occur within very complex molecular systems of extreme instability, perhaps under the influence of, in contact with, the very same hydrolyst (enzyme) which, when separated from the cell, is so active in promoting the hydrolysis of cane sugar, or, if not, of substances of a similar nature. On inspecting Baeyer's formulæ it will be noticed that during rehydration the elements of the water molecule become added on to non-contiguous carbon-atoms; this appears to be a special feature of such changes. Supposing that the protoplasmic hydrolyst were to condition the formation of a conducting circuit in which any two of the carbon systems (CH_2OH , CH.OH or COH) of the glucose molecule and water mole-

cules were included, if the total hydrolytic change which could take place in such a circuit were exothermic, even if the change affecting the one group involved an expenditure of energy, water would be "electrolysed," and its hydrogen would effect the withdrawal of OH from the one group and its displacement by hydrogen, while oxygen would be added to the other group, it may be directly, or in consequence of the displacement of H by OH. The different effects produced by different organisms, on this hypothesis, would be the consequence of the hydrolysis affecting different systems. As most, if not all, fermentable compounds are asymmetric, and the enzymes are undoubtedly also asymmetric bodies, the direction of attack would depend on the character of the asymmetry of both hydrolyte and hydrolyst, and only compatible hydrolysts, *i.e.*, those compatible with the hydrolyte, would condition the hydrolysis, *i.e.* fermentation.

If only the conversion of glucose into alcohol and carbon dioxide be considered, there is a danger of regarding fermentation as a purely destructive process, but it must not be forgotten that in some cases products are obtained which afford the clearest evidence of the occurrence of constructive changes. It is, however, probable that some of these are the outcome of interactions occurring, as it were, naturally and independently between products of enzymic change, and that the direct function of the enzyme in fermentation may after all be only to induce simplification, not complication. Thus, to explain the production of isobutyl-carbinol (the inactive amyl alcohol of fusel oil) from glucose, it may be supposed that in the first instance the glucose is resolved by enzymic action into a mixture of glyceraldehyde, $\text{CH}_2(\text{OH}).\text{CH}(\text{OH}).\text{COH}$, with the isomeric glyceroketose, $\text{CH}_2(\text{OH}).\text{CO}.\text{CH}_2(\text{OH})$, which interact spontaneously, a new hexose, $(\text{CH}_2\text{OH})_2.\text{C}(\text{OH}).\text{CH}(\text{OH}).\text{CH}(\text{OH}).\text{COH}$, being formed, and that this in turn becomes transformed by enzymic influences into amyl alcohol. Again, to account for the production of butyric and caproic acids from lactic acid, it may be supposed that the latter is partly reduced by "fermentation" to the aldehyde $\text{CH}_2.\text{CH}(\text{OH}).\text{COH}$, and that an interaction then occurs spontaneously between this aldehyde and unchanged acid, giving rise to the complex acid $\text{CH}_3[\text{CH}(\text{OH})]_4.\text{COOH}$, which on further fermentation yields acetic, butyric, and caproic acids. The formation of fat from carbohydrates is doubtless a process of the same kind, in which at an early stage at least three molecules of glucose, or some substance closely related thereto, become condensed into one, much as three molecules of acetone $\text{C}_3\text{H}_6\text{O}$, yield a single molecule of phorone, $\text{C}_9\text{H}_{14}\text{O}$; the reduction of the complex so produced is then effected by enzymic influence. Recent observations, however, prove beyond question that the ordinary hydrolytic changes effected by enzymes are reversible, and therefore that the enzymes must be credited with synthetic powers. Croft Hill was the first to observe that glucose is partially converted into a biose by diastase, and he supposed that maltose was formed; later observations seem to show that it yields isomaltose: it may be that both are formed. Emil Fischer and E. Frankland Armstrong have since found that a mixture of glucose and lactose in contact with the kephir enzyme yields a biose closely related to if not identical with milk sugar.

Ordinary alcoholic fermentation is a nicely-balanced action in which the products of the presumed "electrolysis" of water are fully utilized, so that neither oxygen nor hydrogen is liberated. In butyric and many other fermentations, however, hydrogen is freely evolved, and in these cases somewhat more highly oxidized products (acids instead of alcohols) are formed; in fact, the evolution of hydrogen involves the occurrence of an amount of oxida-

tion corresponding to the hydrogen liberated, and in excess of that observed when no hydrogen is liberated. The production of butyric and caproic acids, of amylic alcohol, and also that of fat, can only be explained on the assumption that while one set of molecules undergoes reduction another set undergoes oxidation. The separation of oxygen as such has not yet been observed to take place during fermentation, but if hydrogen be evolved as the result of "excessive" oxidation, it would seem to follow that oxygen should be evolved if reduction took place to an extreme extent.¹ It is conceivable, and indeed probable, that the oxygen evolved from plants in sunlight owes its origin to an effect of this kind, and that it may be connected with the reduction of chlorophyll previously referred to as a necessary step in the reduction of carbon dioxide. In other words, the chlorophyll acts, in a measure, as a polarizable electrode or catalyst, against which hydrogen is delivered, and at which the dioxide suffers reduction, being one term in a complex circuit in which hydrolytic change is proceeding. It is a noteworthy fact that a tendency to form fat—the most highly-reduced normal product of vital metabolism—is particularly noticeable in the case of animals, and that oxidative changes occur in these to a far greater extent than in plants.

It is commonly supposed that interactions such as occur in animals and plants are not to be regarded as mere chemical changes, but that they take place within the protoplasm, and in subjection to its influence. It is possible to accept this interpretation, and yet to regard such processes as cases of chemical interchange pure and simple. The formation of starch and of fat may be taken as examples. It is impossible at present to explain under what conditions and precisely how these are formed, and yet they are so easily formed that it is probable that they are produced in a comparatively simple manner. The formation of starch from glucose is a process in which a large number of molecules of the latter become associated, and one in which, doubtless, molecule must be "presented" to molecule in some very definite manner. It may well be that glucose does not exist in an ordinary aqueous solution in the proper form to undergo consideration. There are at least two isodynamic forms of glucose:

Of these the second appears to be a relatively inert form, and this perhaps is the dominant, if not the only form, existing in a dilute solution. It is conceivable that such a molecule might enter into loose combination with a protoplasmic molecule in such a way as to cause its conversion, so to speak, into the more active aldehydic form, in consequence of the OH groups becoming attached to the protoplasm. The aldehydic group would then be in a position to operate freely. It is also possible that in the case of a compound such as glucose the configuration is such that the OH groups mutually interfere, and, as it were, promote a policy of vacillation, and that on one set becoming neutralized by attachment to the protoplasm another set becomes free to act uniformly, so that their activity can be manifested in a direction before impossible.

PHYSICAL PROPERTIES.

That physical and chemical properties are strictly correlative there is not the slightest doubt, but the exact nature of the relationship is far from understood, more

particularly because of the many difficulties in the way of arriving at really comparable values. In the case of gases, as the molecules are widely separated, they may be regarded as independent entities and outside the range of intermolecular attractions. But this is not the case with liquids or solids, and our knowledge of physical properties relates mainly to the liquid state. The molecules in liquids are undoubtedly held together with a degree of firmness—and to an extent—which varies from series to series, and even within series, so that although in the case of liquids composed of molecules which are easily separable, it may be possible to make comparisons at corresponding temperatures at which the character of interrelationship of the molecules is of the same order, or nearly so, for all the substances, in other instances this is impossible. Acetic acid may be cited as an extreme case. As the vapour of this compound, even at temperatures considerably above its boiling-point, is not composed of the fundamental molecules represented by the formula $\text{C}_2\text{H}_4\text{O}_2$, but mainly consists of complex molecules formed by their union, it is impossible to contrast acetic acid properly with compounds which are readily reduced to the unimolecular form. Whenever possible the boiling-point has usually been selected as the temperature at which there is likely to be the closest approach to uniformity of intermolecular conditions, but it is clear that this is by no means always the case. Thorpe and Rodger, who have very carefully studied the relationship between the viscosity of liquids and their chemical nature (*Phil. Trans.* 1894, p. 397), have shown that "temperatures of equal slope"—i.e., those at which $d\eta/dt$ is the same for different liquids—tend to reveal much more definite relations between the values of the viscosity co-efficients (η) and the chemical nature of substances than can be deduced from observations made at the boiling-point.

At one time there was a strong tendency to believe in physical constants, and to regard the molecular values as the sums of certain fixed atomic values. As the area of discussion has been widened, however, and not only compounds of relatively simple constitution, but also those more complex in structure have been studied, the conviction has gained ground that the "atomic" values are subject to considerable variation. Such variations almost always occur in cases in which they are to be expected on chemical grounds. Thus the nearest approach to constancy is observed in the paraffinoid hydrocarbons, which are remarkable on account of the simplicity and uniformity of their chemical behaviour as well as on account of their inertness. Ethenoid hydrocarbons differ entirely in many of their properties from the paraffinoids, the ethenoid linkage exercising a peculiar physical effect; the extent to which variation occurs within the series, however, cannot be judged of, as the material available for discussion is altogether insufficient. Benzenoid hydrocarbons exhibit an altogether peculiar and variable behaviour.

Not only are the peculiarities of the hydrocarbons reproduced in their derivatives, but in many cases other peculiarities become apparent which are clearly traceable to the influence exerted by the radicle introduced into the hydrocarbon complex. There is reason to suppose that in the case of paraffinoid compounds the hydrocarbon radicle has a practically constant influence, and that the variations observed in ascending the series may be referred to differences in the influence exerted by its associates. In other series probably both radicles are variants. In ethenoid compounds, in which two of the carbon atoms may be regarded as united by two affinities of each, but in such a way that the full force of each affinity is far from being exerted, the affinities are deflected from the mean positions

¹ It has recently been stated by Pakes and Jollyman (*Trans. Chem. Soc.* 1901, 322), that a little oxygen is contained in the gases produced by *B. pyocyaneus* when grown anaerobically.

Variation
of atomic
values.

which they tend to take up in the unrestrained carbon atom, and it may be supposed that the extent to which the affinities of the paired carbon atoms are deflected varies according to the nature of their associates. But the deflection would vary only within narrow limits; consequently, the limits within which the ethenoid "constant" may be expected to vary are narrow. In the case of benzenoid compounds a much wider variation may be possible. In discussing their chemical properties, it has already been pointed out that the centric system must be regarded as a plastic group within which considerable variation of the affinity relationships may take place. Physical properties tell the same tale. To give but one or two examples. No property affords a more sensitive test of changes in structure than the refractive power. If the refractive power of the C_6 group in benzene be calculated by deducting from the molecular refractive power the value of six hydrogen atoms—hydrogen being supposed to have a constant value in all compounds—and the difference be divided by 6, the value for the carbon atom is very nearly 6. If a similar calculation be made for the methylated homologues of benzene, assigning to CH_3 the value that it has in other series, the value for the carbon atom (in the C_6 group) is found to increase from 6 in benzene to 6.15 in trimethylbenzene (mesitylene). If a similar calculation be made for aniline, assuming that NH_2 has the value assigned to it in paraffinoid amines ($7.7 = 5.1 + 2.1.3$), a still higher value is obtained for carbon, viz. 6.3. Whether these variations are to be ascribed solely to variations in the centric system, or whether the associated radicles also vary, it is at present impossible to decide; the question has already been raised in discussing the occurrence of chemical change in the case of benzenoid compounds, and it has been pointed out that there is some reason to suppose that even the CH_3 group has special properties in benzenoid hydrocarbons, but the argument is by no means conclusive.

With regard to the alteration in physical properties consequent on the introduction of other elements into

**Special
Influence
of oxygen.**

hydrocarbons, oxygen exercises a greater effect perhaps than any other, and one which is especially noticeable in the case of properties which are mainly "intermolecular" effects. Thus the introduction of hydroxyl into the paraffins has the effect of converting very slightly viscous compounds of low boiling-point into relatively highly viscous compounds boiling at temperatures far above those at which the parent hydrocarbons are vaporized. There can be little if any doubt that the peculiar physical properties of oxygen compounds are to be correlated with their exceptional chemical activity—that the residual affinity which is possessed by oxygen in most of its compounds in so high a degree, and which conditions the preliminary associations determinative of chemical change, is also operative in causing the fundamental molecules to cling together and form complexes to an extent not met with in compounds of other elements, so that the special peculiarities of oxygen compounds may be ascribed to the oxygen. Whether the properties of the paraffinoid radicle are in any way modified by association with oxygen or other elements is a difficult question to decide. In discussing it geometrical considerations must needs be taken into account. In the normal paraffins and in the corresponding primary alcohols, the carbon atoms are arranged in a branchless chain, but in the secondary alcohols the hydrocarbon radicles have two, and in the tertiary alcohols three branches. The primary alcohols may, therefore, be pictured as simple filaments progressing, it may be, with a wave-like motion. As the hydrocarbon radicle is composed of saturated elements, it may be regarded as practically indifferent to all external attractions, and the

activity of the compound may be located at the oxygenated extremity or head, the hydrocarbon radicle being supposed to oscillate about a mean position relatively to the OH group. In the secondary and tertiary alcohols, in which the filaments are branched, the hydrocarbon radicles are brought into closer proximity with the OH group, and they will also tend to oscillate on one side of the mean position taken up by the primary radicle, unless the constituent groups are of such dimensions as to balance one another. Such differences in structure might alone condition a materially different behaviour of the molecules towards each other, which would be apparent in the viscosity, density, and boiling-point relationships. Optical properties, on the other hand, which are mainly conditioned by intermolecular structure, would be but slightly affected; and chemical properties should not be materially altered. As a matter of fact, considerable differences are noticed on contrasting the chemical behaviour of the lower with that of the higher terms of the series in the case not only of the alcohols, but also of the ketones and acids derived from the paraffins. As there is no reason to suppose that the hydrocarbon radicle undergoes any modification, it may be assumed that the oxygen is the inconstant element; but as only the lowest terms differ to any marked extent, it would seem that when a certain point is reached variation can no longer take place. To draw a rough parallel, the oxygen appears to behave much as if it were connected with the hydrocarbon radicle by a spring which cannot be extended beyond a certain limit; in the lower terms of the series the spring is not fully extended, but the limit is soon reached. Differences such as are observed between phenol, for example, and the paraffinoid alcohol, hexylic alcohol, are of interest from this point of view. Although of lower molecular weight, phenol is a crystalline solid at temperatures at which the alcohol is liquid, and as a liquid it is more viscid than the alcohol. Phenol also manifests weak acid properties, which may be regarded as evidence that the oxygen has some power of attracting bases. It has been shown also that phenol exists in many solutions as a double molecule. On all grounds, therefore, it seems probable that the oxygen in phenol has more residual affinity than that in hexylic alcohol. The great increase in viscosity which attends the introduction of several hydroxyl groups is also corroborative of the argument here used. The extreme viscosity of polyhydric alcohols, such as glycerol, is possibly a consequence of the arrangement of the three oxygen atoms in one plane in such a way as to constitute an "oxygen surface." Exact determinations of the viscosity relationships of isomeric asymmetric polyhydric alcohols of known configuration would be of great value as testing a point of this kind. Variations in the physical effects produced by oxygen are particularly apparent in compounds in which oxygen is associated with carbon by two affinities, much in the way that carbon is associated with carbon in ethenoids. Speaking generally, oxygen apparently behaves as though its two affinities took the form of a looped filament, the two ends of which represent its ordinary affinities, and the loop the dependent or residual affinity. The variations it exhibits may then be pictured as variations in the size of the loop, no secondary point of attachment remaining when it is reduced to a mere knot.

A factor of the highest importance, which in many cases conditions striking physical peculiarities, remains to be referred to, viz., that of co-operative action. If the heat of formation of chlorinated paraffinoid compounds be calculated from the heats of combustion, it appears, as J. Thomsen has pointed out, that on an average about 13,500 gram. deg. C. units of heat are developed in the fixation of a single atomic proportion of

**"Co-
operative
effect."**

chlorine; but that in the case of di-derivatives the average amount of heat developed is far greater, viz., $\frac{33,000}{2} = 16500$ units. As the value found for tri-derivatives is only $33,000 + 13,500$, it is to be supposed that the extra-outgoing of affinity is in some way due to an interaction of the two halogen atoms. Similar differences are apparent in the case of other properties. Thus the refraction equivalents of chlorine and bromine, calculated from observations made with compounds such as ethylene chloride and bromide, are distinctly higher than those deduced from observations made with monochlorides and bromides. Again, Thorpe and Rodger have shown that the viscosity constants of dichlorides and dibromides are remarkably different from those of the monochlorides and monobromides. But the effect is most obvious in the case of iodo-compounds. Thus the refraction equivalent (58.2) of methylene iodide, CH_2I_2 , is far higher than that calculated (52.1) on the assumption that the value of each atom of iodine is that of the iodine atom in methyl iodide. In all the cases referred to the two atoms of halogen are associated either with a single carbon atom or with contiguous carbon atoms, and there is little doubt that this will be found to be necessary to the production of the effect under consideration. One of the very few observations bearing on this point is that of Perkin, showing that the molecular rotatory power acquired in a magnetic field is considerably higher in the case of propylene bromide, $\text{CH}_3\text{CHBrCH}_2\text{Br}$, (10.82), than in that of the isomeric trimethylene bromide, $\text{CH}_2\text{BrCH}_2\text{CH}_2\text{Br}$, (10.34). The "co-operative effect" is most obvious, however, in compounds in which several benzenoid and ethenoid systems are conjoined. Thus if the atomic refractive power of carbon be calculated from the molecular refractive power of diphenyl, $\text{C}_6\text{H}_5\text{C}_6\text{H}_5$, its apparent value is about 6.4, whereas in benzene it is only about 6. Stilbene, in which an ethenoid group is interposed between two phenyl groups, Ph.CH:CH.Ph , is still more "abnormal" in its behaviour, its molecular refractive power (113.4) exceeding the calculated value by 12 units. The very high refractive power of cinnamic aldehyde, which exceeds the calculated value by 10 units, may be accounted for in a similar way, and even seems to suggest that this compound is to be represented as Ph.CH:C.CH.OH , rather than as Ph.CH:CH.CO.H , i.e., that it is the isodynamic form of the aldehyde.

It is by no means improbable that the principle here developed may prove to be of wide application, and that it will afford an explanation of the many "anomalies" which are apparent on contrasting the properties especially of benzenoid compounds with those of the paraffinoids; it may also serve to explain the fact that they often differ from paraffinoids in physical properties to an extent altogether disproportionate to the extent to which they differ from them in their chemical properties. Perkin's observations on the rotation of polarized light in the magnetic field by benzenoid compounds afford many striking illustrations of their peculiar behaviour (*Trans. Chem. Soc.* 1896, p. 1026). Thus, on contrasting the rotatory power of phenol with that of benzene, and that of heptylic alcohol with that of heptane, the difference due to the displacement of H by OH is 0.856 in the case of phenol, but only 0.181 in the case of the alcohol. That the superior effect exercised by the OH group is at least mainly due to the co-operative action of the centric system and the oxygen appears probable from the fact that the difference between toluene, Ph.CH_3 , and benzylic alcohol, $\text{Ph.CH}_2\text{OH}$ (0.243), is but slightly in excess of the paraffinoid value. Co-operative action can only be exerted by contiguous radicles. A comparison of the values for benzene, nitrobenzene, and the mono-derivatives containing halogens, leads to similar conclusions:—

	Mol. rot.	Diff.
Nitrobenzene . . .	9.361	1.923
Benzene . . .	11.284	1.314
Fluorbenzene . . .	9.970	2.540
Chlorobenzene . . .	12.510	1.996
Bromobenzene . . .	14.506	4.602
Iodobenzene . . .	19.108	

The fact that the differences are negative in the case of nitro- and fluorbenzene is in itself almost a proof of co-operation. When the effects produced by the other halogens in benzene are contrasted with those they produce in propylic compounds, the differences observed are—

Chlorine - 0.253. Bromine - 0.086. Iodine 0.321.

In benzene, therefore, chlorine has a slight negative influence, and only iodine has a marked extra positive effect: such a result is in harmony with the fact that in carbon compounds generally iodine alone has a marked tendency to exhibit residual affinity.

But by far the strongest argument in favour of the view here advocated is afforded by the consideration of the conditions which determine the appearance of colour in carbon compounds. The majority of coloured compounds may be referred to one type, that of quinone (α). Speaking generally, they contain two ethenoid groups $\text{C}:\text{R}''$, in ortho- or para-positions, in association with an unsaturated benzenoid nucleus. As compounds such as diketohexamethylene (β), in which the nucleus is saturated, are colourless,

colour must be supposed to originate in the co-operation of the two ethenoids with the unsaturated nucleus, and each must be regarded as an independent light-absorbing centre. Whether the nucleus be represented as a centric or as an ethenoid structure matters little; suffice it to say that coloured compounds are known of the dihydrobenzene type (γ), so that it is to be supposed that either the centric or the ethenoid-system may act as the third centre. A colour-producing system such as is present in quinone may, therefore,

be represented by the symbol = If this symbol be adopted as a broad definition of quinonoid structure, it is probably safe to assert that all coloured substances are quinonoids. Iodoform is a compound of particular interest from this point of view. Attention has already been directed to the exceptionally high refractive power of methylene iodide, CH_2I_2 , and to the probability that this is due to the co-operation of the two iodine atoms. Such a compound may be regarded as the analogue of diketohexamethylene, each iodine atom exercising an influence similar to that exercised by the CO group in the keto-compound. When a third atom of iodine is introduced, forming iodoform, CHI_3 , an effect is produced equivalent to that observed when diketohexamethylene is converted into quinone and a third absorbing centre is developed—the highly refractive di-iodide becoming intensely yellow when converted into the tri-iodo-derivative. The introduction of a fourth iodine atom has the effect of greatly intensifying the colour. From this point of view it is easy to understand that all tri- and tetriodides, but only polymerized di-iodides such as mercuric iodide (HgI_2)_x, should be coloured.

The appearance of colour in an open or pseudo-quinonoid system, as distinguished from a closed or true quinonoid system, is dependent on a certain intensity of effect being developed. Chlorine and bromine do not act sufficiently powerfully to condition colour, neither does the presence of three phenyl groups in association with a single carbon

atom suffice, triphenylmethane, CHPh_3 , being colourless, although abnormally refractive. It is also noteworthy that benzil, Ph.CO.CO.Ph , if coloured at all, is at most a very pale yellow substance; if not a consequence of its symmetrical structure, this may be due to the fact that the compound is one in which there is but little residual affinity. The colour of substances such as azobenzene, Ph.N:N.Ph , may be ascribed to the co-operation of the two phenyl systems with the diazo N:N system.

Quinone and its homologues, and indeed the simple quinones generally, are at most either yellow, or orange, or orange-red in colour; as a rule para-quinones are yellow; and the unsymmetrical ortho-quinones orange to red. The introduction of oxygen (as OH) or halogens usually has the effect of deepening the colour—a result, it may be supposed, of the introduction of a further slight co-operative effect. Colours other than yellows and reds—blue shades of red, greens and blues—are met with only in mixed quinonoids, *i.e.*, compounds in which the two C:R' groups are dissimilar, one at least being a more or less complex group. The colours of the rosaniline group, for example, are all derivatives of the complex $\text{R':C}_6\text{H}_4\text{:CPh}_2$, R' being usually either NH or NR' , and either NH_2 or a substituted NH_2 group being present in each of the Ph groups. The colour is much intensified by the association of several quinonoid or pseudo-quinonoid systems. Thus the simple diazo-dyes, formed from the diazo-benzenes and either phenol or aniline, or their homologues, are all derivatives of azobenzene, $\text{C}_6\text{H}_5\text{:N:N.C}_6\text{H}_5$, and resemble this compound in being yellows. The derivatives of azonaphthalene, $\text{C}_{10}\text{H}_7\text{:N:N.C}_{10}\text{H}_7$, are much deeper in colour, many pronounced reds being met with amongst them; the intensification of the colour is doubtless a consequence of the greater influence exerted by the naphthyl group. By diazotizing the amido-derivative of a diazo-dye, and then coupling the diazo-compound with amines or phenols, disazo-compounds are produced in which the azobenzene or azonaphthalene complex is contained twice. Still more complex substances are easily prepared by repeating such a series of operations. Many of these polyazo-dye stuffs absorb light so completely that they are almost black. The hydroxy-derivatives of anthraquinone afford another striking example of the influence exercised by accumulated effects. The lower derivatives are orange-red or red, the higher greens and blues; it is impossible to account for the difference on the assumption that it is due to the mere accumulation of hydroxyl groups in the one molecule, but it is easily understood if it be granted that anthraquinone itself is not the basis of the colour to which it gives rise, but an isodynamic compound. Thus the formation of alizarin may be assumed to involve the isodynamic change

The corresponding heteronuclear tetrhydroxy anthraquinone may be supposed to undergo change, thus:—

In the one compound a quinonoid system is developed on only one, but in the other on both sides of the complex.

If the argument here adduced be accepted as valid, there is no difficulty in understanding why a limited meaning must be attached to the conception of atomic constants. It would seem that, except perhaps in the paraffin series, we are called upon to study the behaviour of more or less elastic systems—not of atoms which can freely exert a constant individual influence. In such systems the affinities are more or less deflected and controlled and subject to change according to the influence which is brought to bear upon them, and therefore they exercise a varying effect. Still more important, probably, is the variation due to the degree of influence which the systems exercise by acting in co-operation.

A similar doctrine may be found to apply to metallic salts and to inorganic metallic compounds generally. That a profound difference exists between metals and non-metals there can be no doubt, and that the latter tend to form complexes comparable in some cases with the ethenoid and centric hydrocarbon systems is also in the highest degree probable. But the investigation of metallic salts is complicated and rendered much more difficult than that of carbon compounds by the tendency they display to form complex molecules, and also by the readiness with which they enter into combination with water. The conclusion that coloured carbon compounds are quinonoids, using this term in a broad sense, if extended to elements, would involve the conclusion that the structure of these is in many cases comparable with that of quinonoids.¹ The increase in the intensity of the colour as atomic weight increases in the case of the halogens; the intense blue colour of ozone in comparison with that of oxygen; and especially the intense colour and extraordinarily complicated absorption spectrum of nitrogen dioxide, are of interest from this point of view. In all these cases intensity of colour is associated with a high degree of chemical activity, and the conclusion is irresistible that the existence of residual affinity determines the appearance of colour. In any case it should be worth while to take into account the apparent simplicity of the mechanism by which colour is produced in carbon compounds, and to consider whether it may not be sufficient even to account for the complicated absorption spectra which characterize many compounds: it may well be that these have their origin in the superposition of effects produced at a very limited number of absorbing centres, and that colour is the outcome of intramolecular interferences.

In this article the attempt has been made to pass briefly under notice what appear to the writer to be the more important problems in chemistry which have been the subject of discussion during the period 1875-1900, and besides indicating the directions in which progress has been made, to give some idea of the problems which press for solution. The end the chemist has in view is to gain clear conceptions of the nature of the primary materials, *i.e.*, the elements, with which he has to deal, and an understanding of the operations into which they enter. He is called upon, however, to study their behaviour in crowds and companies in circumstances of great difficulty, in order that he may form an opinion of their behaviour as individuals and depict their characters. That so much success has already attended his labours is proof that the methods in use are essentially sound, but the opportunities awaiting future inquirers are infinite.

(H. E. A.)

¹ It is a question of interest whether the blue colour of oxygen be not due to the presence of complexes $(\text{O}_2)_x$. Abney's observations show that solutions of colourless salts in water are less absorptive in the infra-red region than in water *per se*; this may be regarded as proof that the colour of water is at least in part conditioned by the presence of molecular complexes.

Colours of
metallic
salts, &c.

Con-
clusion.

Chemnitz, a town of Saxony, Germany, in the fertile valley of the Mulde, 50 miles by rail W. by S. from Dresden and 51 S.E. of Leipzig. It is one of the principal commercial and industrial centres of Germany. Its importance arises from its cotton-spinning, hosiery, furniture, textile, and glove manufactures, in which a very considerable trade is done with the United Kingdom and the United States of America. Its locomotive and agricultural implement works are of world-wide reputation. It is also the seat of considerable dyeworks, bleachworks, chemical and woollen factories, and produces leather and straps, cement, small vehicles, wire-woven goods, carpets, beer, and bricks. The churches of St Peter (1888), of St Nicholas (1888), and St Mark (1895), and the synagogue (1899) are the principal new buildings of interest. The town is especially well provided with technical schools for training in the various industries, including a commercial, public, economic, and agricultural schools, and has a chamber of commerce. There are also industrial and historical museums, and collections of paintings and natural history. To the north-west of the town is the Gothic church of a former Benedictine monastery, dating from 1514-25, with a tower of 1897. Chemnitz is a favourite tourist centre for excursions into the Erzgebirge, the chain of mountains separating Saxony from Bohemia. Population (1885), 110,817; (1890), 138,954; (1895), 161,017; (1900), 206,584. The commune of ALT-CHEMNITZ (6398 in 1890) was incorporated with Chemnitz in 1894.

Chênée, a town of Belgium, in the province of and 3 miles S.E. of Liège, on railway to Verviers. It has forges, iron and copper foundries, and manufacture of glass. Population (communal) (1880), 5765; (1897), 8334.

Chenery, Thomas (1826-1884), English scholar and editor of the *Times*, was born in 1826 at Barbados, and educated at Eton and Caius College, Cambridge. Having been called to the bar, he went out to Constantinople as *Times* correspondent just before the Crimean war, and it was under the influence there of Mr Algernon Smythe (afterwards Lord Strangford) that he first turned to those philological studies in which he became eminent. After the war he returned to London and wrote regularly for the *Times* for many years, and eventually succeeded Delane as editor in 1877. He was then an experienced publicist, particularly well versed in Oriental affairs, an indefatigable worker, with a rapid and comprehensive judgment, though he lacked Delane's intuition for public opinion. It was as an Orientalist, however, that he had meantime earned the highest reputation, his knowledge of Arabic and Hebrew being almost unrivalled and his gift for languages exceptional. In 1868 he was appointed Lord Almoner's professor of Arabic at Oxford, remaining professor till he became editor of the *Times*, and he was one of the company of revisers of the Old Testament. He was secretary for some time to the Royal Asiatic Society, and published learned editions of the Arabic classic *The Assemblies of Al-Hariri* and of the *Machberoth Ithiel*. He died in London, 11th February 1884.

Cher, a department in the centre of France, watered by the river of the same name.

Area, 2819 square miles, with 29 cantons and 292 communes. The population decreased from 355,349 in 1886 to 342,889 in 1901. Births in 1899, 6843, of which 527 illegitimate; deaths, 6336; marriages, 2615. In 1896 there were 684 schools, with 50,000 pupils, and 6 per cent. of the population was illiterate. Bourges, the capital, had a population of 44,000. The area under cultivation in 1896 amounted to 1,645,780 acres, 1,035,408 acres of which were plough-land and 296,536 acres woods and forests. In 1899 the wheat crop returned a value of £1,414,000, and oats £648,000. The produce of the vines was valued at £185,000. The live stock in 1899 included 38,090 horses, 155,580 cattle, 369,000 sheep, and 42,220 pigs. The mining industry in 1898

registered 18,000 metric tons of iron, and the working in metals 17,000 metric tons of cast iron of the value of £480,000.

Cherbourg, a seaport and chief town of arrondissement, department of Manche, France, 46 miles N.N.W. of St Lô, and 230 miles from Paris by rail. The manufacturing industries of Cherbourg, other than those connected with the Government works, are now limited, the most important being engineering, steamboat-building, and the manufacture of agricultural implements. Shipping in 1899 comprised 946 vessels entered, tonnage 989,043, and 1021 cleared, tonnage 985,882. Of this Great Britain's share was, vessels entered 774, tonnage 408,707, and cleared 825, tonnage 198,011. Wines have become one of the principal imports, and the export of stone to England has largely increased during recent years. Cherbourg is a port of call for several lines of English and American transatlantic companies. There are a chamber of commerce, a civil and naval hospital, and four libraries. In the commercial harbour the inner basin has now a length of 1311 feet, a width of 650 feet, a depth on sill at ordinary spring tide of 25 feet, and 3026 feet of quayage; in the tidal harbour the depth of water varies from about 26 feet high spring to 7 feet low neap tide; length of quays 2952 feet. The military port with the connected buildings covers an area of 54 acres. It comprises three principal basins, with a minimum depth of 30 feet. Population (1881), 27,439; (1901), 42,952.

Cherbuliez, Charles-Victor (1829-1899), French novelist and miscellaneous writer, was born 19th July 1829, at Geneva, where his father was a classical professor at the university. He was descended from a family of Protestant refugees, and many years later resumed his French nationality, taking advantage of an Act passed in the early days of the Revolution. Geneva was the scene of his early education; thence he proceeded to Paris, and afterwards to the universities of Bonn and Berlin. He returned to his native town and engaged in the profession of teaching. After his resumption of French citizenship he was elected a member of the Academy (1881), and having received the Legion of Honour in 1870, he was promoted to be officer of the Order in 1892. He died 1st July 1899. Cherbuliez was a voluminous and successful writer of fiction. His first book, originally published in 1860, reappeared in 1864 under the title of *Un Cheval de Phidias*: it is a romantic study of art in the golden age of Athens. He went on to produce a series of novels, of which the following are the best known:—*Le Comte Kostia* (1863), *Le Prince Vitale* (1864), *Le Roman d'une honnête Femme* (1866), *L'Aventure de Ladislav Bolski* (1869), *Miss Rovel* (1875), *Samuel Brohl et Cie.* (1877), *L'Idée de Jean Tétoral* (1878), *Noirs et Rouges* (1880), *La Vocation du Comte Ghislain* (1888), *Une Gageure* (1890), *Le Secret du Précepteur* (1893), *Jacquine Vanesse* (1898), &c. Most of these novels first appeared in the *Revue des Deux Mondes*, to which Cherbuliez also contributed a number of political and other learned articles, usually printed with the pseudonym G. Valbert. Many of these have been published in collected form under the titles *L'Allemagne politique* (1870), *L'Espagne politique* (1874), *Profils étrangers* (1889), *L'Art et la Nature* (1892), &c. The volume *Études de littérature et d'art* (1873) includes articles for the most part reprinted from *Le Temps*. The earlier novels of Cherbuliez have been said with truth to show marked traces of the influence of George Sand; and in spite of modification, his method was that of an older school. He did not possess the sombre power or the intensely analytical skill of some of his later contemporaries, but his books are distinguished by a freshness and honesty, fortified by cosmopolitan knowledge and lightened by

unobtrusive humour, which fully account for their wide popularity in many countries besides his own. His genius was the reverse of dramatic, and attempts to present two of his stories on the stage have not succeeded. His essays have all the merits due to liberal observation and thoroughness of treatment; their style, like that of the novels, is admirably lucid and correct. (c.)

Cheribon (Dutch, *Tjeribon*), the most easterly residency of West Java, with an area of 262,064 square miles. It is separated from Tegal in the E. by the small river Losari, which also marks the boundary between the Sundase of West and the Javanese of Middle and East Java. The northern part of the residency, with the exception of the volcano Tjeri Mai (10,000 feet), consists of an alluvial coast plain, drained by the Manuk, which rises in the high mountains of Preanger. The Tandui, which also rises in Preanger, forms the southern boundary. Rice is cultivated on the low marshy grounds, and in addition to other products, tea is a special culture. The total population in 1897 was 1,577,521, comprising 867 Europeans, 21,108 Chinese, 1896 Arabs, other Oriental foreigners 120, natives, 1,553,530. **CHERIBON**, the chief town, has a roadstead, safe during the west monsoon, from which it is protected by the north and south trend of the coast. Imperfect drainage and the silting up of the little river Tjeribon long rendered the town unhealthy and the port almost inaccessible. Improvements have, however, been recently effected—a channel 900 feet long has been constructed, and the large number of Chinese and Arab residents indicate the commercial activity. Sugar and coffee are exported in considerable quantity, and the total port traffic amounts to about 200,000 tons annually. Railways and tramways afford land communication with Batavia, Samarang, and the neighbouring residencies, and steamers with the other islands of the archipelago.

Chernomorskaya, formerly a province of Russia, North Caucasia, now a separate military district of Kuban. It includes the narrow strip of land along the east coast of the Black Sea, from Novorossiysk, its capital, to nearly as far as Pitsunda, between the sea-coast and the water-parting of the main Caucasus range, which sends many spurs to the coast, leaving a narrow and extremely malarial belt between the mountains and the sea. A rich vegetation of a southern character, favoured by copious rains, grows along the coast; but the country, since the forced exodus of the Tcherkesses, is very thinly populated. It is divided into three districts: Novorossiysk, capital of the province (20,511), Veliaminovsk, and Soch (chief town Dakhovskiy Posad, 1040). Novorossiysk is connected by rail with the main line of North Caucasia, and a mountain road is being made from Veliaminovskaya (Tuapse) to Maikop in Kuban. A road runs all along the coast, upon which small Russian and pretty Czech villages are growing up. Population (1896), 49,745, chiefly Russians, also Greeks, Czechs, Armenians, and about 1300 Tcherkesses.

Cherso (Serbo-Croatian, *Cres*), an island belonging to the Austrian province of Istria, in the Gulf of Quarnero. Population, 10,180—two-thirds Serbo-Croatians and one-third Italians. The chief town, which bears the same name, has 4725 inhabitants. It is a harbour, and is provided with a shipwright's wharf. The principal resources of the population are the cultivation of the vine and olive, fishing and seafaring.

Chesham, a parish, urban district (1894), and market town of England, on the Chess, an affluent of the Colne, 13 miles S.E. of Aylesbury by rail, in the Aylesbury parliamentary division of Buckinghamshire. Under a local board from 1885, it was by the Local Government Act,

1894, erected into an urban district. Besides the ancient church of St Mary, Christchurch (1864), and a church built in 1887, there is a Congregational chapel (rebuilt in 1886), a Baptist chapel (rebuilt in 1898), a Wesleyan chapel (erected in 1897), and a Calvinistic chapel. Other buildings are the town hall and a mechanics' institute. There are numerous charities. All sorts of small dairy utensils, chairs, malt-shovels, &c., are made of beech, the growth of which forms a feature of the surrounding country. Shoemaking is also carried on. In Waterside hamlet, adjoining the town, are flour mills, duck farms, and watercress beds. Chesham publishes two weekly newspapers. In consequence of the constitution in 1898 of three new parishes the area of Chesham has been reduced to 10,360 acres. Its population on the old area of 12,746 acres was in 1881, 6502; on the new area (1891), 6075; (1901), 7245.

Cheshire or **CHESTER**, a north-western county of England, bounded on the N. by the Mersey, which separates it from Lancashire, on the N.E. by York and Derby, on the S.E. by Stafford, on the S. by Shropshire, on the W. by Denbigh, Flint, and the estuary of the Dee, and on the N.W. by the Irish Sea.

Area and Population.—The area of the ancient county is 657,068 acres or 1027 square miles. The population in 1881 was 644,037, and in 1891 was 730,058, of whom 352,936 were males and 377,122 females, the number of persons per square mile being 711, and of acres to a person 0.91. In 1901 the population was 814,555. The area of the administrative county, as given in the census returns of 1891, was 655,036 acres, with a population of 743,869; but since then several alterations have been made in the administrative area. In 1895 the parish of Tittenley in Cheshire was transferred to Shropshire; in 1896 part of the parish of Threapwood in Flint was transferred to Cheshire; in the same year part of the townships of Appleton-with-Hull, Latchford Without, and Walton Inferior was transferred from Cheshire to Lancashire; and in 1898 part of the township of Ashton-under-Lyne was transferred from Lancashire to Cheshire, and part of the township of Dukinfield from Cheshire to Lancashire. The area of the registration county is 643,791 acres, with a population in 1891 of 707,978, of whom 508,498 were urban and 199,480 rural. Within this area the increase of population between 1881 and 1891 was 13.76 per cent. The excess of births over deaths between 1881 and 1891 was 84,417, and the increase in resident population was 85,655. The following table gives the numbers of marriages, births, and deaths, with the number of illegitimate births, for 1880, 1890, and 1898:—

Year.	Marriages.	Births.	Deaths.	Illegitimate Births.	
				Male.	Female.
1880	4269	20,823	12,303	526	509
1890	5171	21,161	13,684	536	509
1898	5671	22,064	13,467	473	457

The number of marriages in 1899 was 5957, of births 22,004, and of deaths 13,893.

The following table gives the marriage, birth, and death rates per 1000 of the population, with the percentage of illegitimate births, for a series of years:—

	1870-79.	1880.	1880-89.	1890.	1897-98.	1898.
Marriages . .	15.5	13.8	13.6	14.7	14.1	14.7
Births . . .	35.4	33.8	32.1	30.2	30.0	28.7
Deaths . . .	21.4	19.9	19.0	19.5	18.4	17.5
Percentage of illegitimacy	5.4	5.0	5.1	4.9	4.6	4.2

In 1891 there were in the county 8651 natives of Scotland, 20,006 natives of Ireland, and 2254 foreigners.

Constitution and Government.—The ancient county is divided into eight parliamentary divisions; and it also includes the parliamentary borough of Birkenhead, returning one member, part of Stockport, returning two members, and parts of Ashton-under-Lyne, Chester, Stalybridge, and Warrington, returning one member each. The administrative county contains nine municipal boroughs: Birkenhead (110,928), Chester (36,281), Congleton (10,706), Crewe (42,075), Dukinfield (18,929), Hyde (32,768), Macclesfield (34,635), Stalybridge (27,674), and Stockport (78,875). Birkenhead, Chester, and Stockport are county

boroughs. The following are urban districts: Alderley Edge (2856), Alsager (2597), Altrincham (16,831), Ashton-upon-Mersey (5563), Bollington (5244), Bowdon (2788), Bredbury and Romiley (7107), Bromborough (1891), Buglawton (1452), Cheadle and Gatley (10,807), Higher Bebington (1540), Hollingworth (2447), Hoole (5341), Hoylake and West Kirby (10,911), Knutsford (5172), Lower Bebington (8387), Lymm (4707), Marple (5595), Middlewich (4669), Mottram in Longendale (3128), Nantwich (7722), Neston-cum-Parkgate (4154), Northwich (17,609), Runcorn (16,491), Sale (12,088), Sandbach (5556), Tarporley (2644), Walsley (53,580), Wilmslow (7361), Winsford (10,382), and Yeardsley-cum-Whaley (1487). The county is in the North Wales circuit, and assizes are held at Chester. The boroughs of Congleton, Crewe, Macclesfield, Stalybridge, and Stockport have separate commissions of the peace and separate courts of quarter sessions. The ancient county—which is chiefly in the diocese of Chester and partly in those of Lichfield, Manchester, and St Asaph—contains 254 entire ecclesiastical parishes.

Education.—There is a residential training college (Chester, Manchester, and Liverpool diocesan) at Chester. The total number of elementary schools on 31st August 1899 was 488, of which only 36 were board, and 452 were voluntary schools, the latter including 334 National Church of England schools, 28 Wesleyan, 29 Roman Catholic, and 61 "British and other." The average attendance at board schools was 10,024, and at voluntary schools 93,609. The total school board receipts for the year ended 29th September 1898 were over £67,693. The income under the Technical Instruction Act was over £55, and that under the Agricultural Rates Act was over £302.

Communications.—Besides being traversed by a network of railways and numerous small canals, Cheshire is now skirted on the north by the Manchester Ship Canal, opened in 1894. (See under LANCASHIRE.)

Agriculture.—Within recent years much attention has been paid to the improvement of agriculture by special training in dairy work and in farming. Nearly five-sixths of the total area is under cultivation, and of this about three-fifths is in permanent pasture, chiefly for dairy-farming purposes—the manufacture of cheese and milk supply. More than 14,000 acres are in hill pasture, nearly 2500 acres under orchards, and over 24,000 acres under woods. Oats occupy about three-fourths of the acreage under corn crops, and potatoes more than one-half of that under green crops, only about one-fourth being planted with turnips and swedes. There is a considerable acreage under small fruit. The following table gives the larger main divisions of the cultivated area at intervals of five years from 1880 :—

Year.	Total Area under Cultivation.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	536,348	79,534	37,043	54,644	363,420	1707
1885	540,551	79,472	42,091	58,818	359,580	590
1890	541,348	80,986	38,887	62,390	357,128	771
1895	539,555	78,242	39,483	63,621	355,750	495
1900	536,332	82,449	41,933	70,987	339,023	266

The following table gives particulars regarding the principal live stock for the same years :—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or in Calv.	Sheep.	Pigs.
1880	23,081	151,866	91,174	97,892	49,971
1885	21,966	172,019	101,892	86,343	62,988
1890	22,314	167,465	99,650	106,418	77,464
1895	26,143	170,136	102,791	92,456	78,392
1900	26,917	182,638	107,406	103,456	70,126

Industries and Trade.—According to the report of the chief inspector of factories for 1898 (1900) the total number of persons employed in factories and workshops in 1897 was 112,598, as compared with 114,391 in 1896. The number employed in textile factories was 43,182; between 1895 and 1896 there was an increase in the number of 2·3 per cent., but between 1896 and 1897 a decrease of 0·5. The main textile industry is cotton, employing 34,446 persons; silk employs 8025 persons. The non-textile factories in 1897 employed 60,936 persons, there being an increase between 1895 and 1896 of 6·4 per cent., and a decrease between 1896 and 1897 of 3·0 per cent. Over a third (20,766) were in 1897 employed in the manufacture of machines, conveyances, tools, &c. On the Mersey there are a number of shipbuilding yards, in addition to several large engine, machine, and iron works. In the manufacture of chemicals 5874 persons were employed, in clothing industries 9555, in print, bleach, and dye works 4474, and in the founding and conversion of metal 5068. Workshops in 1897 employed 8480 persons, of whom 4205 were employed in the clothing industry and 1054 in that of food. In 1899 there were 3489 per-

sons employed in mines and quarries. In the same year 127,972 tons of sandstone were raised, 26,785 of gravel and sand, and 20,967 of clay; but the principal minerals are coal and salt. The output of coal in 1890 was 637,402 tons, valued at £191,221; and in 1899 it was 721,431 tons, valued at £270,537. Rock-salt is obtained at Northwich and Winsford, and salt from brine is manufactured at Lawton, Wheelock Valley, Middlewich, Northwich, and Winsford. In the case of rock-salt the value in the returns is lumped with that of Lancashire, and in the case of salt from brine the quantity is lumped with that of Staffordshire, so that exact statements of the tonnage and value of the annual production are impossible; but in 1899 the amount was at least considerably over 1,000,000 tons, and the value must have closely approached £400,000.

AUTHORITIES.—Among the principal works are: Sir JOHN DODD-RIDGE. *History of the Ancient and Modern State of the Principality of Wales, Duchy of Cornwall, and Earldom of Chester.* London, 1630; 2nd ed. 1714.—KING. *The Vale-Royall of England, or the County Palatine of Cheshire Illustrated*, 4 parts. London, 1656; abridged by T. Hughes, London, 1852.—HANSHALL. *History of the County Palatine of Chester.* Chester, 1817-23.—J. O. (T. F. H.)

Cheshunt, a town and railway station in the Hertford parliamentary division of Hertfordshire, England, on the Lea, 7 miles S. of Hertford. Cheshunt College for theological instruction was established here in 1792 by the countess of Huntingdon. There are an ancient church, recently restored, two halls for public meetings, church rooms, a cottage hospital, and a recreation ground of 8 acres. Nursery and market gardening, largely under glass, brick-making, and saw-mills are the chief industries. Area of parish (an urban district), 8480 acres; population (1881), 7736; (1901), 12,288.

Chesney, Sir George Tomkyns (1830-1895), English general, colonel-commandant of Royal (late Bengal) Engineers, youngest son of Captain Charles Cornwallis Chesney of the Bengal Artillery, was born at Tiverton, Devonshire, on 30th April 1830. Educated at Blundell's School, Tiverton, and at Addiscombe, he entered the Bengal Engineers as second lieutenant on 8th December 1848. He was employed for some years in the Public Works Department and, on the outbreak of the Indian Mutiny in 1857, joined the Ambala column, was field-engineer at the battle of Badli-ke-serai, brigade-major of engineers throughout the siege of Delhi, and was severely wounded in the assault (medal and clasp and a brevet majority). In 1860 he was appointed head of a new department in connexion with the Public Works accounts. His work on *Indian Polity* (1868), dealing with the administration of the several departments of the Indian Government, attracted wide attention and remains a permanent text-book. The originator of the Royal Indian Civil Engineering College at Cooper's Hill, Staines, he was also its first president (1871-80). In 1871 he contributed to *Blackwood's Magazine* a brilliant skit called "The Battle of Dorking"—a picture of what might happen if the victorious German army, after defeating France, invaded England—which was republished in many editions and translations, and produced a profound

impression. He was promoted lieutenant-colonel, 1869; colonel, 1877; major-general, 1886; lieutenant-general, 1887; colonel-commandant of Royal Engineers, 1890; and general, 1892. From 1881 to 1886 he was secretary to the Military Department of the Government of India, and was made a C.S.I. and a C.I.E. From 1886 to 1892, as military member of the Governor-General's Council, he carried out many much-needed military reforms. He was made a

C.B. at the jubilee of 1887, and a K.C.B. on leaving India in 1892. In that year he was returned to Parliament, in the Conservative interest, as member for Oxford, and was chairman of the committee of service members of the House of Commons until his death on 31st March 1895. He wrote some novels, *The Dilemma*, *The Private Secretary*, *The Lesters*, &c., and was a frequent contributor to periodical literature. (R. H. V.)

CHESS.

THE article on CHESS in the ninth edition of the *Encyclopædia Britannica* was written in 1875. W. Norwood Potter, who appended his initials, was one of the foremost English players and writers on the game; he died in 1895. The article was, in essentials, the joint work of Steinitz and Zukertort. Dr J. H. Zukertort died in 1888, five years after his famous victory in the London tournament in 1883, and W. Steinitz survived his great rival about thirteen years. In 1876 England was in the van of the world's chess army. Two years previously Staunton, for years the English champion, had died. De Vere died a year later in the prime of life, being only twenty-nine years old. The latter was an irreparable loss, and England has produced no chess genius since. English-born players then were Boden, Burn, MacDonnell, Bird, Blackburne, and Potter; whilst among naturalized English players were Löwenthal, Steinitz, Zukertort, and Horwitz. Of this remarkable array of talent only Bird, Blackburne, and Burn survived in 1901. This illustrious contingent was reinforced in 1878 by Mason, an Irish-American, who came over for the Paris tournament, and by Gunsberg, a Hungarian, and more recently by Teichmann, who also made England his home. English chess under the leadership of the masters mentioned flourished. The chief prizes in tournaments, up to within comparatively recent years, were consistently carried off by the English representatives, as will be seen from the following list of tournaments from 1878 up to date:—

PARIS, 1878.—First, Zukertort; second, Winawer; third, Blackburne; fourth, Mackenzie; fifth, Bird. Winawer made an equal score with Zukertort, but was beaten in the tie match. Winawer, whose name was unknown, competed for the first time in the Paris tournament, 1878, and to the surprise of everybody he won the second prize (Kölisch being first) amongst competitors like De Vere, Steinitz, Neumann, and Rosenthal. He tied and divided the first and second prizes with Steinitz in Vienna, 1882, and won the first prize at Nürnberg, 1883. In this tournament B. Englisch of Vienna made his first appearance, and the promising talent of which he then gave evidence was fully justified in his career during the next nineteen years. It was also Mason's first appearance in Europe.

WIESBADEN, 1880.—First, second, and third a tie between Blackburne, Englisch, and A. Schwarz.

BERLIN, 1881.—First, Blackburne; second, Zukertort; third and fourth, Tchigorin and Winawer; fifth, Mason. Blackburne, who previously to this tournament was beaten in a match by Zukertort, rehabilitated his reputation by winning the first prize with three games to spare, Zukertort being second. Tchigorin made his first public performance in this contest.

VIENNA, 1882.—First and second, Steinitz and Winawer; third, Mason; fourth and fifth, Mackenzie and Zukertort; sixth, Blackburne.

LONDON, 1883.—First, Zukertort; second, Steinitz; third, Blackburne; fourth, fifth, and sixth equal, Mackenzie, Mason, and Englisch. This tournament, played in two rounds, endowed with large prizes, and the third draw only counting one-half each, was one of the most severe contests held hitherto. Zukertort won the first prize very easily, and also played the finest games. Steinitz challenged him shortly afterwards to a match, but it only came off three years later in America, and ruined Zukertort both in body and mind. Winawer, for the first time in his career, was not even placed.

NÜRNBERG, 1883.—First, Winawer; second, Blackburne; third, Mason; Bardeleben and Bird taking the other prizes. This

tournament is a milestone in modern chess history. The prizes having been comparatively small, it was thought that it necessarily must be a failure, the munificently endowed London tournament having just been concluded. But, strange to say, whilst in London fourteen players competed, there were nineteen entries in Nürnberg. Winawer, not placed in the former, won the first prize in the latter. A number of young and talented players made their first appearance, amongst them being Fritz, Bardeleben, Hruby, Riemann, Schottländer, Gunsberg, and of older masters L. Paulsen and the famous Dr Max Lange. It is also noteworthy that, having won the "Haupt" tournament at this congress, the afterwards famous Dr Tarrasch gained the title of "master."

HAMBURG, 1885.—First, Gunsberg, the next prizes being divided by Blackburne, Mason, Englisch, Dr Tarrasch, and Weiss; seventh, Mackenzie. Max Weiss of Vienna, Englisch's rival, made his first appearance here. This tournament was remarkable for the fact not only that five players made an equal score, and divided the five prizes after the first, but that Gunsberg wired to London that he had won the first prize, when Mason, who had to finish several adjourned games, could still have tied with him.

HEREFORD, 1885.—First, Blackburne; second and third, Bird and Schallopp; fourth, Mackenzie. In this tournament Mason and the late W. H. K. Pollock competed, as well as the well-known amateurs Rev. A. B. Skipworth, Rev. C. E. Ranken, and the late E. Thorold.

LONDON, 1886.—First, Blackburne; second, Burn; third and fourth equal, Gunsberg and Taubenhaus; fifth, Mason; Mackenzie, Bird, Lipschütz, and Hanham not placed.

NOTTINGHAM, 1886.—First, Burn; second, Schallopp; third and fourth equal, Gunsberg and Zukertort.

FRANKFORT, 1887.—First, Mackenzie; second and third, Blackburne and Weiss; fourth, Bardeleben; fifth and sixth, Berger and Tarrasch, followed by Englisch and L. Paulsen. Gunsberg, first in Hamburg, was not placed, nor Burn nor Zukertort. Mackenzie, of Scottish extraction, living in America, deservedly won first prize.

BRADFORD, 1888.—First, Gunsberg; second, Mackenzie; third and fourth, Mason and Bardeleben; fifth, Burn, followed by Blackburne and Weiss.

NEW YORK, 1889.—First and second equal, Tchigorin and Weiss; third, Gunsberg; fourth, Blackburne; fifth, Burn, followed by Lipschütz and Mason. There were twenty competitors, some Americans playing. Of the latter Lipschütz only was placed.

BRESLAU, 1889.—First, Dr Tarrasch; second, Burn; third, Weiss, followed by Bardeleben and Bauer, Gunsberg and Paulsen equal; Blackburne and Mason, the former for the first time not placed. This tournament is remarkable for the advent of Lasker, who gained his mastership in the "Haupt" tournament. Here also Mieses scored his first success.

AMSTERDAM, 1890.—First, Burn; second, Lasker; third, Mason; fourth, van Vliet; fifth, Gunsberg. There were only nine competitors, Lasker unexpectedly losing to van Vliet by a trap.

MANCHESTER, 1890.—First, Dr Tarrasch; second, Blackburne; third and fourth, Bird and Mackenzie; fifth and sixth, Gunsberg and Mason, followed by Alapin, Scheve, and Tinsley.

DRESDEN, 1892.—First, Dr Tarrasch; second and third, Makovetz and Porges; fourth and fifth, Marco and Walbrodt; sixth and seventh, Bardeleben and Winawer. Blackburne received only a special prize, Mason not being placed at all. Makovetz, a talented Hungarian, who never played afterwards, made his first appearance, as well as Walbrodt, a Berlin player of promise. The latter did not, however, justify the very high expectations formed of him.

LEIPZIG, 1894.—First, Dr Tarrasch; second and third, Lipke and Teichmann; fourth and fifth, Blackburne and Walbrodt; sixth, Janowsky and Marco. It was the first appearance of two great players, Lipke of Halle, and Janowsky, of Polish extraction, living in Paris; also of Teichmann, a well-known English resident, who gave great promise at the time when Lasker became known.

The success of this tournament was mainly due to the enthusiastic efforts of the late Dr Max Lange.

HASTINGS, 1895.—First, Pillsbury; second, Tchigorin; third, Lasker; fourth, Tarrasch; fifth, Steinitz; sixth, Schiffers, followed by Bardeleben and Teichmann. This tournament is historical for the advent of Pillsbury, the American champion, and Maroczy, the Hungarian champion; Lasker being only third; Tarrasch, after four successive first prizes, being only fourth; and Steinitz, fifth; whilst Schlechter, Blackburne, Marco, Janowsky, Mason, Walbrodt, Mieses, Bird, and Gunsberg were not placed at all. Hastings must be considered the beginning of the greater tournaments. It is also a curious fact that Maroczy, the eminent Hungarian, was refused admission to the minor tournament because his name was not known to the committee. Fortunately a vacancy gave him a chance of showing his skill. He won the first prize.

NÜREMBERG, 1896.—First, Lasker; second, Maroczy; third and fourth, Pillsbury and Tarrasch; fifth, Janowsky; sixth, Steinitz, followed by Schlechter and Walbrodt. Remarkable for the first appearance of Charousek, and for the fact that Dr Tarrasch was again low in the list, and Blackburne, Tchigorin, Marco, Winawer, and Charousek not placed at all. Charousek was just as obscure at Nuremberg as Maroczy was at Hastings. Dr Tarrasch detected the genius of the youthful candidate, and admitted him to the tournament.

BUDAPEST, 1896.—First, Tchigorin; second, Charousek; third, Pillsbury; fourth and fifth, Janowsky and Schlechter; sixth and seventh, Walbrodt and Winawer. Remarkable features: Maroczy not placed at all, and Dr Tarrasch only receiving a special prize for the best score against prize-winners.

BERLIN, 1897.—First, Charousek; second, Walbrodt; third, Blackburne; fourth, Janowsky; fifth, Burn, followed by Alapin, Marco, and Schlechter. Tchigorin, Winawer, and Teichmann not placed, whilst Englisch had to abandon the tournament and return to Vienna ill. He never recovered, and died a few weeks later.

VIENNA, 1898.—First, Dr Tarrasch; second, Pillsbury; third, Janowsky; fourth, Steinitz; fifth, Schlechter; sixth and seventh, Burn and Tchigorin; eighth and ninth, Lipke and Maroczy; tenth, Alapin. Blackburne received a special prize. Dr Tarrasch achieved a remarkable victory in this important tournament. Pillsbury's chances were better than his, but he managed to run him neck and neck, and beat him in the tie match which followed. Although Lasker did not compete, the tournament was quite as important as that at Hastings.

COLOGNE, 1898.—First, Burn; second, third, and fourth, Charousek, Cohn, and Tchigorin; fifth, Steinitz; sixth and seventh, Schlechter and Showalter, followed by Berger and Janowsky. It is curious that Cohn stood first up to the last round; in the end he gave way. Charousek, who was convalescent and played against the advice of the doctors, made a slip in one of the games, a serious drawback in so short a contest.

LONDON, 1899.—First, Dr Lasker; second, third, and fourth equal, Janowsky, Maroczy, and Pillsbury; fifth, Schlechter; sixth, Blackburne; seventh, Tchigorin; eighth, Showalter; ninth, Mason. A very important tournament, organized under the auspices of the British Chess Club. It was a two-game tournament, and a one-round tournament was held simultaneously. In the latter Marco, Mieses, and Marshall of America competed with some well-known British amateurs. Marshall won the first prize. The chief tournament was noteworthy for the fine games which occurred, and for the fact that Janowsky sacrificed the second prize by trying to win a game against Steinitz when with an easy draw in hand he could have secured it.

MUNICH, 1900.—Tie between Maroczy, Pillsbury, and Schlechter for the three chief prizes; fourth, Burn; fifth, Marco; sixth, Cohn; seventh and eighth divided between Berger, Janowsky, Showalter, and Wolf. Lasker did not compete, but a new star was found in Wolf of Vienna, whilst France was represented by a talented amateur, M. Billicard. It was a close contest between Pillsbury, Maroczy, and Schlechter. Maroczy abandoned the contest owing to ill-health, and the two others fighting out the tie made even games, and divided first and second prizes. A big "Haupt" tournament with twenty-two entries was held, and several other tournaments.

PARIS, 1900.—First, Dr Lasker; second, Pillsbury; third and fourth, Maroczy and Marshall; fifth, Burn; sixth, Tchigorin; seventh, Marco and Mieses. Schlechter, with an equal score to the latter two, did not obtain a prize, because his total was made up by a large number of drawn games, and under the rules this total was of inferior quality to the totals made up of won games. Marshall was unexpectedly successful; he beat both Lasker and Pillsbury, and for some time he had expectations of a higher place even than the one he eventually obtained. This was a two-game tournament, and a number of very fine games were produced. Janowsky, Showalter, and Mason were not placed. Didier, a French amateur, showed more talent than steadiness.

MONTE CARLO, 1901.—First, Janowsky; second, Schlechter; third and fourth, Scheve and Tchigorin; fifth, Alapin, followed by Mieses and Blackburne; Gunsberg, Marshall, Mason, Marco, and Winawer not being placed. This tournament was originated by the Société des Bains de Mer, M. Blanc, the director, entrusting the veteran master, M. Arnous de Rivière, with the carrying out of the scheme. A novel rule was introduced, viz., the first drawn game to count $\frac{1}{2}$ each, to be replayed, and in case of a draw again to count $\frac{1}{2}$ each, and in case of win $\frac{1}{2}$ to the winner. Theoretically this seems logical, but in practice it did not work as well, the result being just the contrary to what was expected. Some players indulged in too many draws. Otherwise the tournament was a success.

PROBLEMS.

A chess problem has been described as "merely a position supposed to have occurred in a game of chess, being none other than the critical point where your antagonist announces checkmate in a given number of moves, no matter what defence you play." Correct enough so far as it goes, the above description conveys no notion of the degree to which problem composing has become a specialized study of late years. At first but a modest adjunct of the game proper, owing its inception doubtless to the practice of recording critical phases from actual play, wherein the issue turned upon some particularly subtle and instructive manoeuvre or strikingly brilliant move, the art of the problem composer has grown in favour until its numerous devotees justifiably style it the "poetry" of the game. The growing perception of the fact that the construction of problems, being in the nature of an "art," was governed by certain æsthetic rules of taste, had the effect of gradually lessening their practical utility to players of the game, and in course of time the positions themselves ceased to bear necessarily any but the remotest resemblance to such as would be likely to arise in the course of play. The reason of this change, the first step in the evolution of the chess problem, is not far to seek.

A good chess problem exemplifies chess strategy idealized and concentrated. In the finest extant examples of actual play there will necessarily remain on the board both white and black pieces immaterial to the issue (checkmate), whereas in the "idealized" problematic presentation of the same combination the composer, being free to select his own materials, employs only *indispensable* force so as to focus attention on the idea, avoiding all material which would tend to "obscure the issue." Whilst the element of difficulty is a highly desirable one in a chess problem, it must be due solely to the intrinsic depth of ideas and the artistic manner in which it is expressed. Hence the use of otiose force is rigorously eschewed, and the first object in a problem composed in accordance with modern theories is to extract the maximum of *finesse* with a sparing use of the pieces. "Economy of force" must be combined with "purity of the mate," in the chief lines of play at least. A proper understanding of what is meant by "economy of force" will help to a better appreciation of the lines upon which the evolution of the chess problem has proceeded. A very common mistake until comparatively recent years was that of appraising the economy of a position according to the slenderness of the force used, regardless of the fact that economy is not a question of absolute values. The only true criterion is the ratio of force employed to the sum total of meritorious play in the course of the solution. The earliest composers strove to give their productions every appearance of real play, and indeed their compositions partook of the nature of ingenious end-games. The entire interest is usually centred in a single forced line of play. It was usual to give Black a predominance of force, and to leave the White King in apparent jeopardy. From this critical predicament he was extricated by a long series of checking moves, usually involving a number of brilliant

sacrifices. The number of moves was rarely less than five, and the conditions were not infrequently cumbered by restrictions on the movements of certain pieces. In the course of time the solutions were reduced to shorter limits, and the beauty of quiet (*i.e.*, non-checking) moves began to make itself felt. The early "transition" school, as it has been called, was the first to recognize the importance of economy as then understood, *i.e.*, the representation of the main point of strategic worth without any extraneous force. The mode of illustrating single-theme problems, often of depth and beauty, was being constantly improved, and the problems of C. Bayer, R. Willmers, S. Loyd, J. G. Campbell, F. Healey, J. B. of Bridport, and W. Grimshaw are, of their kind, still unsurpassed. In the year 1845 the "Indian" problem attracted much notice, and in 1861 appeared Healey's famous "Bristol" problem. To the transition period must be ascribed the discovery of most of those clever ideas which have been turned to such good account in the more richly varied contents of the modern school. In an article written in 1899 F. M. Teed mentions the interesting fact that his *incomplete* collection of "Indians" totalled over three hundred.

In the early 'seventies, which may be called the later transition period, a more general tendency was manifest (as it became recognized that further improvements were well-nigh impossible in the construction of one-idea problems), to illustrate two or more finished ideas in a single problem with strict regard to "purity" and "economy." In the years 1872-75 the theory of the art received greater attention than it had done previously, and the essays of C. Schwede, Kohtz and Kockelkorn, Lehner and Gelbfuss, helped to codify hitherto unwritten rules of taste. The last quarter of the 19th century, and its last decade especially, saw a marked advance in technical accomplishment, until it became a common thing to find as much deep and quiet play embodied in a single first-class problem as in three or four of the old-time problems. This broader conception of the idea of "economy" gave a great impetus to the practice of blending several distinct ideas in one elaborate whole, even at the cost of a slight increase of force, provided always that the principle of "purity" was regarded, if thereby the ratio aforesaid is enhanced.

In the composition of "two-movers" it is customary to allow greater elasticity and no very rigorous application of the principles of purity and economy. By this means a greater superficial complexity is attained; but neither the Teutonic nor the Bohemian school countenances this contravention of what they regard as fundamental æsthetic rules, and even amongst the English and American two-move specialists it is recognized that complexity, at the cost of discarding the canons of construction which obtain in the construction of problems of heavier calibre, is liable to abuse. Mr A. F. Mackenzie of Jamaica, however, is an uncompromising advocate of a relaxation of ordinary rules where two-movers are concerned, and he and a few others (notably T. Taverner, W. Gleave, H. and E. Bettman, and P. F. Blake) have won some of their greatest successes with problems which, under the stricter ruling of Continental authorities, would be tabooed.

Whilst in a sense it is fruitless to discuss the degrees in which composers of varying nationalities may claim to have advanced the art, since the true style is cosmopolitan, Bohemian (Czechish) composers have long stood unrivalled as exponents of that blending of ideas which is the distinguishing trait of the present-day problem. It would not, indeed, be too much to say that they were pioneers, and by their exceptional technical skill popularized the theories which nowadays find almost universal acceptance. Such is their skill in construction that the distinction

between main lines of play and subsidiary variations disappears entirely. Indeed, it is rare to find in a problem of the Bohemian school fewer than three or four lines of play which, so far as economy and purity are concerned, are unimpeachable. Amongst the earliest composers of the small band that was destined to revolutionize the standard of composition so widely, Anton König, the founder of this school, Makovsky, Drtina, Palet, and Pilnacek deserve to be honourably mentioned, but it was not until the starting of a chess column in the weekly journal *Svetozor* that the merits of the new school were fully asserted. It was in 1871 that Jan Dobrusky contributed his first composition to that paper. In 1872 the name of G. Chocholous first appeared, and three years later that of C. Kondelik. These three great composers set up a tradition for finished workmanship which has been worthily upheld without cessation to the present day. Pospisil, Dr Mazel, Kvicala, Kesl, Tuzar, Musil, and J. Kotrc; and later still, Havel, Traxler, and Z. Mach, are no unworthy followers of Dobrusky. The influence of the Bohemian school upon the somewhat conservative proclivities of the older English composers is commonly traced back to the publication of the second prize set of problems from the Leipzig tourney 1879, the work of G. Chocholous.

The characteristic faculty for blending several variations into one harmonious whole is not without "the defects of its qualities," and consequently we find amongst the less gifted exponents that the mere agglomeration of clean and economical variations is apt to be regarded as an end in itself. Hence a certain tendency to repeat combinations of similar companion ideas is discernible at times. The danger that mere virtuosity in facile construction should be allowed to usurp the place of freshness of invention and strategic depth was already apparent to Chocholous when, in an article on the classification of chess problems (*Deutsche Schachzeitung*, 1890), he warned the younger practitioners of the Bohemian school against what had been dubbed by H. v. Gottschall "Varianten-leierei," or the "grinding-out of variations." When this one reservation is made few will be inclined to dispute the pre-eminence of the Bohemian school. To some tastes, however, a greater appeal is made by the generally deeper if less richly varied play typical of the older German school, the quaint fancy untrammelled by hard-and-fast rules of the genial American composer, Samuel Loyd, or the almost ultra-studious immunity from "duals" which is the distinguishing trait of the English school.

The following masters in practical play are also known as composers of distinction: J. Berger, J. H. Blackburne, C. Schlechter, R. Teichmann, Dr H. von Gottschall, J. Mieses, and the late Professor Anderssen, whilst Dr E. Lasker and Steinitz and Zukertort have not disdained to contribute occasionally to the "poetry" of the game. Similarly the following composers are, or were in their time, noted players: Professor J. Berger, S. Loyd, J. G. Campbell, C. D. Locock, and F. M. Teed; and among ladies: Sophie Schett, Mrs T. B. Rowland, and Mrs W. J. Baird, whose record of tourney successes and remarkable accuracy entitles her to a place in the foremost ranks of British composers.

It is somewhat singular that a study, the pursuit of which entails high powers of imagination as well as deep and accurate analysis, has proved to be within the powers of those afflicted with blindness. Yet by universal acclaim Mr A. F. Mackenzie of Jamaica is unsurpassed at the present day. In one tourney he won the prize for three-movers, whilst that for two-movers fell to H. F. Lane, who has likewise to compose *sans voir*. Mr Mackenzie also won the first prize in the self-mate tournament of the

British Chess Magazine and first prize in the problem tournament of the *Wiener Schachzeitung*.

Problem Tournaments.—The idea of holding a problem competition open to the world was first mooted in connexion with the Chess Congress of 1851. The projected tournament was for the time abandoned, but in the year 1854 a tourney confined to British composers was held, and this—the earliest recorded—resulted in the two prizes falling to W. Grimshaw and Silas Angas respectively. A brief summary of the more important tournaments is appended, in which, however, no mention is made of the competitions held in the leading provincial chess columns of the United Kingdom, as to enumerate all would require too much space, whilst a choice would be invidious. Mention may be made of a few of the organs which have been conspicuously successful in attracting the participation of composers of the highest repute: *Leeds Mercury Supplement*, *Manchester Weekly Times*, *Liverpool Weekly Mercury*, *Bristol Mercury*, *Brighton Society*, and *The English Mechanic and Knowledge*. Amongst the prize-winners in these the most notable successes have fallen to G. Heathcote, Mrs Baird, P. F. Blake, P. H. Williams, W. Gleave, and P. G. L. Fothergill.

In the following list the winners of first prizes only are given. Where two or more names occur they represent winners in different sections of the same tourney:—

<i>Era</i>	1855	C. Bayer.
New York	1857	R. Willmers.
Bristol	1861	F. Healey.
London	1862	C. Bayer.
Le Palamède Français	1865	D. Lamouroux.
Paris	1867	C. Bayer.
British Chess Association	1872	S. A. Sørensen.
Paris	1878	J. Berger.
Leipzig	1879	Kohtz and Kockelkorn (joint).
Berlin	1881	E. Pradignat, L. Noack, and F. Dubbe.
<i>Brentano's Magazine</i>	1882	J. Dobrusky.
<i>Chess Monthly</i>	1882	H. Leprettel, Rev. A. Cyril Pearson.
Nürnberg	1883	J. Berger (2), F. Schröder, F. Geyerstam.
<i>Chess Monthly</i>	1884-86	A. E. Studd and F. Healey.
British Chess Association	1886	J. Pospisil.
Prague	1886	J. Kotre and J. Pospisil.
Counties Chess Association	1887	B. G. Laws.
Frankfort	1887	J. Berger and J. Jespersen.
Andrews Memorial (B.C.M.)	1888	J. Kotre.
Breslau	1889	G. Chocholous, R. Adam, and J. Pospisil.
<i>Münchener neueste Nachrichten</i>	1889	F. Schindler, A. Norlin, J. Pospisil.
<i>Bahn Frei</i>	1890	L. de Yong and Z. Bennecke.
<i>St. John's Globe</i>	1891	W. A. Shinkman.
Dresden	1892	O. Fuss and J. Pospisil.
<i>Chess Monthly</i>	1895	B. G. Laws, J. Jespersen, and V. Marin.
<i>Münchener neueste Nachrichten</i>	1893-9	M. Karstedt, F. Möller, F. Meyer, and R. Weinheimer.
<i>Schachmatny Journal</i>	1894	K. Musil.
Prague	1895	W. Tuzar and P. K. Traxler.
<i>Warsaw Courier</i>	1896	L. Vetesnik.
<i>Ruy Lopez</i>	1897	V. Marin.
<i>Neues illustriertes Blatt</i>	1898	J. Svejda.
<i>St. Petersburger Zeitung</i>	1898	J. Fridlitzius.
<i>British Chess Magazine</i>	1898	A. F. Mackenzie, M. A. Dahl, and O. Nemo.
Prague	1899	A. F. Mackenzie.
<i>British Chess Magazine</i>	1900	P. K. Traxler.
<i>Nuova Rivista</i>	1901	E. Pradignat.

Problem Literature.—The following are some of the best works in the English language to consult on chess problems:—J. B. of Bridport. *Chess Strategy*. 1865.—F. HEALEY. *A Collection of 200 Chess Problems*. 1866.—*English Chess Problems*. Edited by JAMES and W. T. PIERCE. 1876.—H. J. C. ANDREWS, E. N. FRANKENSTEIN, B. G. LAWS, and C. PLANCK. *The Chess Problem*

Text-Book. 1887.—A. F. MACKENZIE. *Chess: its Poetry and its Prose*. Jamaica, 1887.—J. A. MILES. *Chess Stars* (self-mates). 1888.—JAMES RAYNER. *Chess Problems*. 1890.—B. G. LAWS. *The Two-Move Chess Problem*. 1890.—*The Chess Bouquet*. Compiled by F. R. GITTINS. 1897.—Mr and Mrs T. B. ROWLAND. *The Problem Art* (second edition). 1898.—E. B. COOK, T. HENERY, and C. A. GILBERG. *American Chess-Nuts*. 1868.—SAMUEL LOYD. *Chess Strategy*. 1878.—W. H. LYONS. *Chess-Nut Burrs and how to open them*. 1886.—C. A. GILBERG. *Crumbs from the Chess Board*. 1890.—*Canadian Chess Problems*. Edited by C. F. STUBBS. 1890.—W. PULITZER. *Chess Harmonies*. 1894.—G. E. CARPENTER (N. Preti of Paris). *200 Chess Problems*. 1900.

History.—According to Mr W. S. Branch of Cheltenham, an authority on problem lore, the earliest known problem dates from the 9th century, and is ascribed to an Arabian caliph. The first known collection is that in a manuscript (in the British Museum) of Alfonso, king of Castile, dated 1250, containing 103 problems; whilst the collection of Nicholas de Nicolai of Lombardy, dated 1300, comprises 192 problems. Problems are to be found in the works of the undermentioned:—Lucena (1487), Damiano (1512), Polerio (1616), Carrera (1617), Stamma (1737), Ercole del Rio (1750), Lolli (1763), Ponziani (1769), Lewis (1817), Mendheim (1832), Alexandre (1846). Other early composers were: Bone, Bolton, D'Orville, L'Hermet, Capraez, Kling, Herlin, Kuiper, Angas, Micheson, Pavitt, Plachutta, Kieseritsky, and Silberschmidt. Coming to the period of the "transition" and "modern" problems (roughly speaking from the middle of the 19th century), the foremost composers of various nationalities have been: (Great Britain), J. G. Campbell, W. Grimshaw, J. B. of Bridport, F. Healey, C. W. of Sunbury, G. J. Slater, A. E. Studd, Mrs Baird, B. G. Laws, C. Planck, C. A. L. Bull, G. Heathcote, P. F. Blake, Rev. A. Cyril Pearson, Sir J. O. S. Thursty, and E. B. Schwann, the latter one of the foremost authorities on the problem in England; (Germany and Austria), C. Bayer, P. Klett, R. Willmers, J. Kohtz, C. Kockelkorn, R. Braune, F. Schröder, A. Bayersdorfer, J. Berger, M. Ehrenstein, H. v. Gottschall, R. Schindler, R. Weinheimer, O. Nemo, M. Feigl, and C. Erlin; (Bohemia), J. Dobrusky, J. Pospisil, G. Chocholous, K. Kondelik, P. K. Traxler, and J. Kotre; (United States), S. Loyd, G. Cheney, G. E. Carpenter, C. A. Gilberg, W. A. Shinkman, F. M. Teed, and O. Wurzburg; (Canada), J. N. Babson; (Jamaica), A. F. Mackenzie; (France), H. Leprettel and E. Pradignat; (Italy), G. B. Valle; (Scandinavia), Fr. af Geyerstam and A. S. Sørensen; (Spain), Tolosa Carreras and V. Marin;

Remarks.—Problems I. to X. are selected to illustrate the old and transition styles of composition, whilst Nos. XI. to XX. belong to the later transition and modern period.

I. and II. are early examples of problem composition.

IV. is the "Indian" in its original, but not wholly sound form.

A. F. Mackenzie describes this now well-worn theme as "covering an ambush in a stale-mating position, giving the king a loophole of apparent escape, and then mating by double check" (*Chess: its Poetry and its Prose*).

V. is from a set in the *Era* tourney; 1855. It is a fine early example of the cross-check theme, the White King exposing himself to the enemy's fire both on the first and second moves.

VI. A prize problem of the year 1859, is an early example of the introduction of several distinct ideas in a single problem. According to later ideas, the check upon the first move would be considered as a key-move of too aggressive a character. In this case, however, compensation is found in the interesting quiet continuations which it introduces.

VII. is the famous Bristol tourney prize problem, 1861, from which the term "Bristol" theme is derived, of which the essential idea consists in moving a piece to a most out-of-the-way place, for the simple object of making room for another piece to reach a desired square. Compare with No. XVII., in which the

"Bristol" idea is worked in accordance with modern ideas of economy and purity.

VIII. A characteristic example of J. B. of Bridport's peculiar style, in which neat construction and elegance are more marked features than complexity.

Problem No. IX. is a masterpiece of difficulty. It was composed in 1871 for a solution tourney at Crefeld.

Problem No. X. is worthy of note as containing a cook (*i.e.*, an unintended second solution) of almost equal obscurity to that intended by the author. A comparison of this problem with No. XIII. by J. Jespersen affords another illustration of the progress in the art of composition. Not only is the latter problem sound, but the unfortunate threat of immediate mate is avoided, and a second idea of equal merit is combined with that common to both. This it will be seen lies in the sacrifice of the Q on the first move, to prevent subsequently a black pawn from moving two squares, so as to nullify the double threat of mate which a quiet second move of the Kt introduces.

Problem No. XIV. is a fine example of the "pawn promotion" theme, the point of which lies in the fact that White (having the right to claim a Q, on advancing his pawn to the eighth square) finds it more effectual to claim pieces of less power, *viz.*, a Knight, a Bishop, and a Rook in the three several variations.

Problem No. XV. is a good example of a theme recurrent. It will be seen that the leading mate given by Q, B, and Kt is repeated, in all cases being perfectly pure, no less than four times.

Problem No. XVI. is given to show the extraordinary lengths to which variety can be carried consistently with a scrupulous regard to the principles of construction. Every single variation results in a mate perfect in form.

Problem No. XVII. is a modern (1896) version of the "Bristol," and shows the advance made, not only in the lighter, cleaner style, but in the addition of a secondary idea of merit.

Problems XVIII. and XIX. are typical "modern style" prize-winners in leading tourneys, and illustrate the blending of several equally fine variations into a harmonious and finished whole.

Problem XX. is an example of a sui-mate.

IMPORTANT MATCHES SINCE 1834.

1896	Moscow	Lasker v. Steinitz	10	2	5

Comments.

Steinitz v. Blackburne (1863).—A remarkable victory, judging from the figures, but Blackburne suffered from a severe cold all through the contest, and should have won at least three games on the merits of the positions.

Paulsen v. Anderssen (1877).—Paulsen's victory was out of proportion considering the respective strength of the players.

Zukertort v. Blackburne (1881).—A legitimate victory, Zukertort being then at the height of his power.

Blackburne v. Gunsberg (1881).—A fair average number of wins for Gunsberg, who was then gradually making his way to the front rank.

Steinitz v. Zukertort (1886).—A memorable match. Zukertort started well ahead; the second series of games was played at St Louis after an interval, which gave Steinitz time to recover from his despondency at the New York defeat. Zukertort lost courage in proportion as Steinitz gained it, so that the concluding series at New Orleans proved Zukertort's débâcle.

Blackburne v. Zukertort (1887).—Blackburne took full revenge for his previous defeat, but Zukertort was already merely the shadow of himself.

Steinitz v. Tchigorin (1889).—A good fight on the part of Tchigorin, the result being exactly what was anticipated.

Gunsberg v. Tchigorin (1890).—Even games being played, Gunsberg would not stake the result of the match upon a single decisive game, which Tchigorin proposed.

Steinitz v. Gunsberg (1891).—Steinitz should have won by a larger majority, but he persisted in playing a number of Evans gambits, defending compromisingly with one of his own inferior variations.

Steinitz v. Tchigorin (1892).—Here the Russian master made a better stand than in the previous match, also owing to Steinitz indulging in hobbies.

Lasker v. Blackburne (1892).—The first noteworthy achievement of the future champion. This was a better result, as far as quality is concerned, than Steinitz's against the latter opponent, for whereas in the match against Steinitz Blackburne had chances of winning some of the games, he had none in this.

Dr Tarrasch v. Tchigorin (1893).—A fine match, well fought and

producing instructive games. This, and Tchigorin's victory at Budapest, were his best performances. It must be remembered that Dr Tarrasch was then considered the greatest living player.

Lasker v. Steinitz (1894).—A memorable match. It was said at the time that Steinitz was ill-advised to accept the challenge of the rising master. So he was. But pecuniary circumstances compelled him to play and to stake a lifelong reputation upon the issue of this contest, even if he had known that he would be beaten. In better circumstances he refused to play with Mason, who challenged him after the match with Blackburne.

Dr Tarrasch v. Walbrodt (1894).—The latter was no match against the famous doctor, and no other comment is required.

Lasker v. Steinitz (1896).—This return match should never have been played. Pecuniary circumstances again induced Steinitz to venture upon a hopeless task. In fact, he insisted on playing, Lasker not being particularly eager. The result was a foregone conclusion, Lasker standing at the height of his fame, having just won the first prize at the great Nuremberg tournament. After the match Steinitz had an attack of mental aberration, which was erroneously ascribed to the "strain upon his mind" which the contest involved. But age and a shattered career, coupled with a predisposition to hypochondria, were the real causes.

GAMES.

The following is a selection of noteworthy games played by famous masters:—

QUEEN'S GAMBIT DECLINED.

White.	Black.	White.	Black.
W. Steinitz.	Dr E. Lasker.	W. Steinitz.	Dr E. Lasker.
1. P - Q4	P - Q4	21. Kt - B3	Kt - Q5
2. P - QB4	P - K3	22. Q x P	Kt x B (ch)
3. Kt - QB3	Kt - KB3	23. P x Kt	R - Kt sq
4. B - B4	B - K2	24. Q x P	R - Kt3
5. P - K3	Castles	25. Q - B4	R x P
6. R - B sq	P - B4	26. P - KR4	B - R2
7. QP x P	B x P	27. B - K4	Q - Q3
8. P x P	P x P	28. P - B4	Q - Q2
9. Kt - B3	Kt - B3	29. B - Kt2	Q - Kt5
10. B - Q3	P - Q5	30. Q - Q3	Kt - B4
11. P x P	Kt x P	31. Kt - K4	B - K6
12. Castles	B - KKt5	32. R - B3	R x B
13. Kt - QKt5	B x Kt	33. K x R	Kt x P (ch)
14. P x B	Kt - K3	34. K - R2	Kt x R (ch)
15. B - K5	Kt - R4	35. K - Kt2	Kt - R5 (ch)
16. K - R sq	Q - Kt4	36. K - R2	Kt - B4
17. B - Kt3	QR - Q sq	37. R - QKt sq	P - R4
18. Q - B2	Q - R3	38. R - Kt5	R - R sq
19. QR - Q sq	R - B sq	39. P - R3	R x P
20. Q - Kt3	P - R3		Resigns.

This game was played in the St Petersburg tournament 1895, a fine specimen of Lasker's style. The final attack beginning with 21...with Kt - Q5 furnishes a gem of an ending.

BISHOP'S GAMBIT.

White.	Black.	White.	Black.
Charousek.	Tchigorin.	Charousek.	Tchigorin.
1. P - K4	P - K4	13. Q - P (ch)	K - K2
2. P - KB4	P x P	14. Kt x P	Kt x Kt
3. B - B4	Kt - QB3	15. B x Kt	P - B3
4. P - Q4	Kt - B3	16. Kt - B3	B - B5
5. P - K5	P - Q4	17. P - K6	R - B sq
6. B - Kt3	B - Kt5	18. B - B7	P x P
7. Q - Q3	Kt - KR4	19. B x Q (ch)	R x B
8. Kt - KR3	Kt - Kt5	20. Q - Kt7 (ch)	R - Q2
9. Q - QB3	Kt - R3	21. R - B7 (ch)	K x R
10. Castles	B - K7	22. Q x R (ch)	B - K2
11. B - R4 (ch)	P - B3	23. R - K sq	R - K sq
12. B x P (ch)	P x B	24. P - QKt3	Resigns.

This pretty game was played in the tie match for first prize at the Budapest tournament 1896.

RICE GAMBIT.

White.	Black.	White.	Black.
Professor Rice.	Major Hanham.	Professor Rice.	Major Hanham.
1. P - K4	P - K4	15. Q - R3	Kt - B7
2. P - KB4	P x P	16. R x B (ch)	B - K3
3. Kt - KB3	P - KKt4	17. K - B sq	Q - R8 (ch)
4. P - KR4	P - Kt5	18. Kt - Kt sq	Kt - R6
5. Kt - K5	Kt - KB3	19. P x Kt	P - B6
6. B - B4	P - Q4	20. B - Kt5	Q - Kt7 (ch)
7. P x P	B - Q3	21. K - K sq	P - B7 (ch)
8. Castles	B x Kt	22. K - Q2	P - B8 = Kt
9. R - K sq	Q - K2		(ch)
10. P - B3	P - Kt6	23. K - Q3	K - Q2
11. P - Q4	Kt - Kt5	24. P x B (ch)	K - B2
12. Kt - Q2	Q x P	25. Q - K7 (ch)	K - Kt3
13. Kt - B3	Q - R3	26. Q - Q8 (ch)	R x Q
14. Q - R4 (ch)	P - B3	27. B x Q and mates	

The Rice Gambit (so called after its inventor, Prof. Isaac L. Rice of New York), whether right or not, is only possible if Black plays 7...B-Q3. Paulsen's 7...B-Kt2 is better, and avoids unnecessary complications. 8. P-Q4 is the usual move. Leaving the Knight *en prise*, followed by 9. R-K sq, constitutes the Rice Gambit. The interesting points in the game are that White subjects himself to a most violent attack with impunity, for in the end Black could not save the game by 22. P-B8 claiming a second Queen with a discovered check, nor by claiming a Knight with double check, as it is equally harmless to White.

RUY LOPEZ.

White. Halprin.	Black. Pillsbury.	White. Halprin.	Black. Pillsbury.
1. P-K4	P-K4	14. P-Kt6	BP x P
2. Kt-KB3	Kt-QB3	15. Kt-Q5	P x Kt
3. B-Kt5	Kt-B3	16. KR-K sq (ch)	K-B sq
4. Castles	Kt x P	17. R-R3	Kt-K4
5. P-Q4	Kt-Q3	18. R x Kt	P x R
6. P x P	Kt x B	19. R-B3 (ch)	K-Kt sq
7. P-QR4	P-Q3	20. B-R6	Q-K2
8. P-K6	P x P	21. B x P	K x B
9. P x Kt	Kt-K2	22. R-Kt3 (ch)	K-B sq
10. Kt-B3	Kt-Kt3	23. R-B3 (ch)	K-Kt2
11. Kt-Kt5	B-K2	24. R-Kt3 (ch)	K-B sq
12. Q-R5	B x Kt	25. R-B3 (ch)	K-Kt sq
13. B x B	Q-Q2		Draw.

This brilliant game, played at the Munich tournament, 1900, would be unique had the combinations occurred spontaneously in the game. As a matter of fact, however, the whole variation had been elaborated by Maroczy and Halprin previously, on the chance of Pillsbury adopting the defence in the text. The real merit belongs to Pillsbury, who had to find the correct defence to an attack which Halprin had committed to memory and simply had to be careful to make the moves in regular order.

SICILIAN DEFENCE.

17. QR-K sq	R-B2		

This game, played in the London tournament, 1883, is one of the most remarkable productions of modern times, neither surpassed nor indeed equalled hitherto.

END GAMES.

A game of chess consists of three branches—the opening, the middle, and the end game. The *openings* have been analysed, and are to be acquired by the study of the books on the subject. The *middle game* can only be acquired practically. The combinations being inexhaustible in their variety, individual ingenuity has its full scope. Those endowed with a fertile imagination will evolve plans and combinations leading to favourable issues. The less endowed player, however, is not left quite defenceless; he has necessarily to adopt a different system, namely, to try to find a weak point in the arrangement of his opponent's forces, and concentrate his attack on that weak spot. As a matter of fact, in a contest between players of equal strength finding the weak point in the opponent's armour is the only possible plan, and this may be said to be the fundamental principle of the modern school. In the good old days the battles were mostly fought in the neighbourhood of the King, each side striving for a checkmate. Nowadays the battle may be fought anywhere. It is quite immaterial where the advantage is gained, be it ever so slight. Correct continuation will necessarily increase it, and the opponent may be compelled to surrender in the end game without being checkmated, or a position may be reached when the enemies, in consequence of the continual fight, are so reduced that the Kings themselves have to take the field—the end game. The *end game*, therefore, requires a special study. It has its special laws, and the value of the pieces undergoes a considerable change. The Kings leave their passive rôle and become attacking forces. The pawns increase in value, whilst that of the pieces may diminish in certain cases.

Two Knights, for instance, without pawns, become valueless, as no checkmate can be effected with them. In the majority of cases the players must be guided by general principles, as the standard examples do not meet all cases.

The handbooks as a rule give a sprinkling of elementary endings, such as to checkmate with Queen, Rook, Bishop and Knight, two Bishops, and pawn endings pure and simple, as well as pawns in connexion with pieces in

Position from a Game played by the late J. G. Campbell in 1863.

Obviously White has to lose the game, not being able to prevent the pawns from queening. By a remarkably ingenious device White averts the loss of the game by stale-mating himself as follows:—

1. B-Q2, P-Kt7; 2. B-R5, P-Kt8=Q; 3. P-Kt4 stale-mate.

Position by Surratt, 1808.

White wins as follows:—

1. P-Kt6, RP×P; 2. P-B6, P(Kt2)×P; 3. P-R6 and wins by queening the pawn. If 1...BP×P then 2. P-R6, KtP×P; 3. P-B6 and queens the pawn.

Position by B. Horwitz.

As a rule the game should be drawn. Supposing by a series of checks White were to compel Black to abandon the pawn, he would move K-R8; Q×P and Black is stale-mate. Therefore the ingenious way to win is:—

1. K-B4, P-B8=Q ch; K-Kt3 and wins. Or 1...K-R8 (threatening P-B8=Kt); then 2. Q-Q2 preliminary to K-Kt3 now wins.

Position by B. Horwitz.

Without Black's pawn White could only draw. The pawn being on the board, White wins as follows:—

1. Kt-B4, K-Kt sq; 2. Kt(B4)-K3, K-R sq; 3. K-Kt4, K-Kt sq; 4. K-R3, K-R sq; 5. Kt-B4, K-Ktsq; 6. Kt(B4)-Q2, K-R sq; 7. Kt-Kt3 ch, K-Kt sq; 8. Kt-B3 mate.

various forms. In the 'eighties a valuable work on end games was published in England by the late B. Horwitz; thus for the first time a theoretical classification of the art was given. This was followed by a more comprehensive work by Professor J. Berger of Graz, which was translated a few years later by the late Mr Freeborough.

A few specimens of the less accessible positions are given below:—

Position by B. Horwitz.

White wins with two pieces against one—a rare occurrence.

1. Kt-K6, B-R3; 2. B-Q4 ch, K-R2; 3. B-B3, B moves anywhere not en prise; 4. B-Kt7 and Kt mates.

Position by O. Schubert.

White wins as follows:—

1. P-Kt5, Kt-Kt5; 2. K-B3, Kt-K6; 3. B-K6, Kt-B8; 4. B×P, Kt-Q7 ch; 5. K-Kt4, Kt×P; 6. P-Kt6, Kt-B8, ch; 7. K-Kt5, P-K5; 8. K×Kt, P-K6; 9. B-B4, K×B; 10. P-Kt7, P-K7; 11. P-Kt8=Q ch, and wins by the simple process of a series of checks so timed that the King may approach systematically. The fine points in this instructive ending are the two Bishops' moves, 3. B-K6, and 9. B-B4, the latter move enabling White to queen the pawn with a check.

Position by F. Amelung.

White with the inferior position saves the game as follows:—

1. P-R6, P×P; 2. K-B3 dis. ch, K moves; 3. R-R2, or Kt2 ch, K×R; 4. K-Kt2 and draw, as Black has to give up the Rook, and the RP cannot be queened, the Black Bishop having no power on the White diagonal. Extremely subtle.

Position by B. Horwitz.

The main idea being to checkmate with the Bishop, this is accomplished thus:—1. B-K4 ch, K-R4; 2. Q×R, Q×Q; 3. K-B7, Q-B sq ch; 4. K×Q, B×P; 5. K-B7, B×P; 6. B-Kt6 mate.

Position by A. Troitzky.

BLACK.

WHITE.

White wins as follows:—

1. P-R8=Q, R-Kt7 ch; 2. K-Kt5, R×Q; 3. Kt-Q7 ch, K-Kt2; 4. P-B6 ch, K-R2; 5. QP×Kt, R-Rsq; 6. Kt-B7 ch, R×Kt; 7. P×R=Kt mate.

Position by Hoffer

BLACK.

WHITE.

A position from actual play. White plays 1. R-B5 threatening to win a piece. Black replies with the powerful Kt-Kt5, threatening two mates, and finally White (Mr Hoffer) finds an ingenious sacrifice of the Queen—the saving clause.

The following are the moves:—

1. R-B5, Kt-Kt5; 2. Q-Kt8 ch, K-Kt3; 3. Q-K6 ch, K-R2; 4. Q-Kt8 ch, and drawn by perpetual check, as Black cannot capture the Queen with K or R without losing the game.

PROGRESS OF THE GAME

To gauge the enormous strides which chess has made since 1875, it will suffice to give the following statistics. In London Simpson's Divan was formerly the chief resort of chess players; the St George's Chess Club was the principal chess club in the West End, and the City of London Chess Club in the east. Now the British Chess Club is the principal West End club, whilst about a hundred or more clubs are disseminated all over the metropolis. Formerly only the British Chess Association existed; after its dissolution the now defunct Counties' Chess Association took its place, and this was superseded by the re-establishment by Mr Hoffer of the British Chess Association, which again fell into abeyance after having organized three international tournaments—London, 1886; Bradford, 1888; and Manchester, 1890—and four national tournaments. There were various reasons why the British Chess Association ceased to exercise its functions, one being that minor associations did not feel inclined to merge their identity into a central association. The London League was established, besides the Northern Chess Union, the Southern Counties' Chess Union, the Midland Counties' Union, the Kent County Association; and there are associations in Surrey, Sussex, Essex, Hampshire, Wiltshire, Gloucestershire, Somersetshire, Cambridgeshire, Herefordshire, Leicestershire, Northamptonshire, Staffordshire, Worcestershire, Lancashire. All these associations are supported by the affiliated chess clubs of the respective counties.

Scotland has its own association and a large number of clubs. Wales counts nine chess clubs, and Ireland several clubs in Dublin, Belfast, and other chief places, altogether about twenty-five.

In spite of all this array of temples devoted to the worship of Caissa, England did not produce one eminent player between 1875 and 1901. First-class chess remained in the hands of the few veterans remaining from the Old Guard—Burn, Blackburne, Mason, and Bird. The old amateurs—with the exception of the Rev. C. E. Ranken—passed away, their place

being taken by a new generation of powerful amateurs, so well equipped that Great Britain could hold its own in an amateur contest against the combined forces of Germany, Austria, Holland, and Russia. It must be distinctly understood that the terms "master" and "amateur" are not used in any invidious sense, but simply as designating, in the former case, first-class players, and in the latter, those just on the border-land of highest excellence. The professional element as it existed in the heyday of Simpson's Divan is almost extinct, the reason being the increased number of chess clubs where enthusiasts and students may indulge in their favourite pastime to their hearts' content, tournaments with attractive prizes being arranged during the season. The former occupation of the masters has gone in consequence; the few who still exist depend upon the passing visitors from the provinces who are eager to test their strength by the standard of the master. Blackburne has visited the provinces annually, keeping the interest in first-class chess alive by his simultaneous play and his extraordinary skill as a blindfold player—unsurpassed until the advent of Pillsbury, who has done similar good work in America. Pillsbury is the only first-class player produced by the United States. America has a number of amateurs—Showalter, Delmar, Hymes, Barry; and they have also beaten Great Britain in producing a second Morphy. Still the Americans have difficulties in recruiting a team of ten for the annual cable match against Great Britain.

It stands to reason that first-class chess can only be acquired by an interchange of opinions with and by the advice of first-class players, and until this fact is recognized and acted upon by the officers of clubs, the undoubted talent of the amateurs may be diverted into the furrows of mediocrity. A club trophy or a cup should not be considered the Ultima Thule of a skilful chess player.

Germany has produced Dr Tarrasch, Dr E. Lasker, Lipke, Fritz, Bardeleben, Walbrodt, Mieses, and a goodly number of amateurs, to replace Anderssen, Paulsen, Tassilo von Heydebrand und der Lasa, and others. Austria has worthy substitutes for Kolisch, Bauer, Falkbeer, in Max Weiss, Schlechter, Marco, and Hruby. It has also such fine players as the Fleissigs, Dr Mertner, Dr Kaufmann, Fahndrich, Jaques Schwarz, and others. Hungary is worthily represented by Maroczy, Makovetz, and Brody, Maroczy being the best since Charousek's death. Russia, having lost Jacnisch, Petroff, and Schumoff, is now represented by Tchigorin, Janowsky, Schiffers, Alapin, Winawer, and Taubenhau, and some younger players are ready to take their place in future. France has been on the decline for many years, and at present has only the veteran M. Arnous de Rivière and the naturalized M. Rosenthal left. Next come Goetz and two good amateurs, MM. Didier and Billecard. Italy has only Signor Salvioli, although latterly Signor Reggio has come to the fore. Holland has a fair number of players equal to English amateurs, but no master since the promising young Van Lennep died. Fortunately the periodical international tournaments contribute in a large measure to maintain the standard of first-class chess. A collection of the games is generally published in book form, whilst the press disseminates a selection of the best games during the progress of these contests.

Past and Present.

The theory of the game has not advanced in proportion to the enormous strides in popularity of chess. The tendency has been one of elimination, and therefore progress has been negative, if the expression may be used. For

merly the theory had been enriched by such enthusiasts as Dr Max Lange, Louis Paulsen, Professor Anderssen, Neumann, Dr Suhle, Falkbeer, Kieseritzky, Howard Staunton, Dr Zukertort, W. N. Potter, and Steinitz, foremost amongst them being Louis Paulsen. The openings were thoroughly overhauled, new variations discovered and tested in practical play over the board. These are now *tempi passati*. The masters who find flaws in old and discover new variations bring them to light only in matches or tournaments, as new discoveries have now a market value; new discoveries may gain prizes in matches or tournaments. For the same reason the romantic school is extinct, and the eliminating process alluded to above has resulted in the retention of a small *répertoire* only, sufficient for practical purposes in important contests. Gambits and kindred openings containing elements of chance are avoided, and the whole stock which a first-class player requires is a thorough knowledge of the *Ruy Lopez*, the *Queen's Pawn Openings*, and the *French and Sicilian Defences*—openings which contain the least element of chance. The *répertoire* being restricted, it necessarily follows that the scope for grand combinations is also diminished, and only strategy or position play remains. The romantic school invariably aimed at an attack on the king's position at any cost; nowadays the struggle is to obtain a "minute" advantage, and the whole plan consists in finding a weak spot in the opponent's arrangement of forces, or to create such a weak spot—and this is the theory of the modern school, conceived and advocated by Steinitz (mentioned under "End Games"). But it is a curious fact that Steinitz founded the modern school rather late in life. He felt his powers of combination waning, and being the "world's champion," and eager to retain that title, he started the new theory. This novel departure revolutionized chess entirely. The attacking and combination style was sacrificed to a sound, sober, and dry style; but Steinitz, strange to say, was not even the best exponent of his own theory, this position falling to younger players, Dr Siegbert, Tarrasch, Schlechter, Mr Amos Burn, and Dr Emanuel Lasker. Pillsbury and Janowsky adhere to both styles, the former in a high degree, and so did the late Dr Zukertort and Charousek, whilst Tchigorin is a free-lance, with a style of his own. The old charm of the game has gone—in match and tournament play at least—and beauty has been sacrificed to exact calculation and to scoring points. This is to be regretted, for the most beautiful games occur still if a player resorts to the gambits. One of the finest games in the Hastings tournament was played by Tchigorin against Pillsbury, and this was a *King's Gambit Declined*; Charousek won a *Bishop's Gambit* against Dr Lasker in the Nuremberg tournament; and some brilliant games occur in *Queen's Gambit Declined*, if either white or black sacrifices the KP. Another reason why gambits should be adopted by players in tournaments is that competitors would necessarily be readily prepared for the regulation openings, so that the gambits might take them by surprise. After all, the new school is a natural consequence of the progress of the game. Paulsen, Anderssen, and Tchigorin devoted a lifetime to the Evans gambit, and volumes of analyses were written on it, and then comes Dr Lasker, revives an obsolete defence, and the Evans gambit disappears! Dr Zukertort achieved a great success with 1 Kt to KB 3 in the London tournament, 1883, and since then this or the kindred 1 P to Q 4 opening has become the trusty weapon in serious encounters. Dr E. Lasker wrote *Common Sense in Chess*, and gave the best defences of the *Ruy Lopez* (a certain form of it); and the "common sense" was demolished in the Paris and Nuremberg tournaments, and old forms of that remarkable opening

have to be refurbished. Any number of similar instances could be cited, but those mentioned will suffice to show the reason for the cautious style of the present day—the Moltkes have replaced the Napoleons.

The former versatility of style could be revived gradually if club tournaments were organized differently. The players should be compelled to adopt one single opening only in a two-round contest, each player thus having attack and defence in turn. The next season another opening should form the programme, and so on. Even in international tournaments this condition might be imposed, and the theory would be enriched; full scope would be given to power of combination and ingenuity, whilst the games would be more interesting. The *raison d'être* of tournaments being to further the progress of the game, the suggestion, it would seem, might be seriously considered. Lovers of the game generally give special prizes for brilliant games, but these prizes are only an allurements to those competitors who no longer hope to gain any of the regular prizes. So as a last resource, having nothing to lose, they adopt a more enterprising style, even at the expense of soundness.

The club trophies and the sums devoted to brilliancy prizes might be devoted to a more useful purpose—namely, as prizes for essays on the Openings, so as to induce experts to devote their leisure to the advancement of the theory. All these suggestions, however, could only be thoroughly carried out by a powerful central authority such as a British Chess Association. If amateurs like Sir George Newnes, Captain A. S. Beaumont, and Mr F. G. Neumann should take steps to reconstitute such an administrative body, a new era for English chess would dawn.

There are still amateurs who devote their energies to the theory of the game; but so long as innovations or new discoveries are not tested by masters in serious games, they are of no value. A case in point may be cited. Steinitz used to keep a number of new discoveries ready to be produced in masters' contests, the result being that his novelties were regularly demolished when it came to a practical test. The mistake was that he did not try his novelties over the board with an opponent of equal strength, instead of trusting to his own judgment.

Literature.

Chess literature has grown *pari passu* with the popular progress of the game. *Gossip's Manual* and *Wormald's Openings* were the last old-form works. No sooner did the *Westminster Papers* (the chief monthly magazine) cease publication, than the *Chess Monthly* was started in its stead by Hoffer and Zukertort, and was continued single-handed by the former after Dr Zukertort's death. It ceased publication after seventeen years' existence. The former *Huddersfield Magazine* was converted into the *British Chess Magazine*, and this is now the only English monthly periodical. The demand for such a publication diminished as the daily press opened its pages to regular chess columns. After the famous London tournament in 1883, the *Standard*, *Morning Post*, and *Daily News* led the way in this matter, other papers following suit; and within recent years the *Times* has had an occasional chess column in its daily and a regular column in its weekly issue. The provincial papers devote still more space to chess than the London press, especially in their Saturday issues. The principal towns have two or more chess columns. Scotland has chess columns in Aberdeen, Edinburgh, and Glasgow; Ireland in Belfast and Dublin; and Wales in the Cardiff *Evening Express*. There are chess columns in every important town in Canada, in New South Wales, Victoria, Melbourne,

South Australia, Queensland, West Australia, New Zealand, British India, Jamaica, Cape Town, Johannesburg, Calcutta, and Malta. In the American press liberal space is devoted to chess, and the same is the case on the Continent of Europe, Germany leading. There are chess publications in Havana, Peru, and even in China.

BIBLIOGRAPHY.—More important works only need be enumerated. There is a vast mass of minor publications, which space does not permit to give. VASQUEZ. *El Archedrez di Memoria*, Havana, 1893; *La Odisea de Pablo Morphy*, Havana, 1893. —BAUER. *Schachlexikon*, Leipzig, 1893. —JEAN DUFRESNE. *Kleines Lehrbuch des Schachspiels*, 6th ed., Leipzig, 1893. —E. Further, The London Tournament Book, 1883; Twelve Tournament Books of the Tournaments of the German Chess Association, Veit and Co., Leipzig; The Hastings Tournament Book, London, 1896; The Vienna Tournament Book, by HALPRIN and MARCO, 1900; The Nuremberg Tournament Book, by Dr TARRASCH; The Book of the London Congress, by L. HOFFER, Longman, 1899; The Paris Tournament Book, Paris, 1900, by ROSENTHAL, &c. (L. H.)

Chester, a city and county of itself, municipal county (1888) and parliamentary borough, episcopal city, seaport, and county town of Cheshire, England, on the Dee, 179 miles N.N.W. of London by rail. A station on the Great Central railway was opened in 1890, whence branch lines have since been made to Hawarden and South Wales. The parliamentary representation was in 1885 reduced to one. The churches include St Mary's-without-the-Walls (1887) and the parish church of St Mary-on-the-Hill (1887). Among the schools are Blue Coat School (1700), the Diocesan Training College for schoolmasters, and the Queen's School for girls (1878). Other buildings are the Royal Theatre (1882), Grosvenor Museum and School of Art (1886), Campbell Memorial Hall (1895). Handbridge Park was opened in 1892. Extensive alterations of the castle are in progress. The navigation of the Dee has been much improved. In 1898, 86 vessels of 7240 tons were registered at the port; entrances numbered 2194 of 167,923 tons; clearances 2092 of 170,232 tons. Imports of foreign and colonial produce for 1898, £29,205, against £49,576 in 1888. Exports of the produce and manufactures of the United Kingdom in 1898 amounted to the value of £16,058, against £1621 in 1888. The area of the municipal borough, according to the delimitation made in 1898, measures 2860 acres. Before then the area of city and county borough was 2960 acres; population on the old area (1881), 36,794; (1901), 36,281. Area of parliamentary borough, whose limits reach into the ancient county of Flint, 3455 acres; population (1881), 40,972; (1891), 42,295; (1901), 46,204.

Chester, a city of Delaware county, Pa., U.S.A., situated in 39° 54' N. lat. and 75° 21' W. long., on Delaware river. It is regularly laid out on a level site, with broad streets, and has extensive cotton manufactures and a large shipbuilding industry, mainly of iron vessels. It is the

site of the Pennsylvania Military College. Three railways traverse it: the Philadelphia, Wilmington, and Baltimore, the Baltimore and Ohio, and the Philadelphia and Reading. The assessed valuation of real property in 1900, on a basis of about two-thirds of the full value, was \$14,883,773, the net debt \$769,647, and the tax-rate \$19.50 per \$1000. Population (1880), 14,997; (1890), 20,226; (1900), 33,988, of whom 5074 were foreign-born and 4403 negroes.

Chesterfield, a municipal borough (enlarged 1892) and market town in the Chesterfield parliamentary division of Derbyshire, England, 24 miles N. of Derby by rail. A gas and water board has been incorporated, and the gas-works reconstructed. A George Stephenson Memorial Hall has been erected, containing a free library, a lecture room, art and science class-rooms, the rooms of the Chesterfield Institute, and a theatre. A large theatre was built in 1895. Chesterfield Hospital has been enlarged, and a public park purchased. There are slate and sandstone quarries in the neighbourhood. Extended area, 1219 acres; population (1881), 19,835; (1901), 27,185.

Chester-le-Street, a town in the Chester-le-Street parliamentary division of Durham, England, 6 miles N. of Durham city by rail. Two Roman altars with inscriptions have been found. A church founded towards the end of the 13th century, and containing interesting memorials, has been restored. There are Congregational and Methodist chapels; also a mechanics' institute and a church institute; an infectious diseases hospital has been opened. Confectionery is manufactured. Area of civil parish, 2900 acres; population (1881), 6911; (1891), 8623; (1901), 11,753.

Chesterton, a parish and village in the Chesterton division of Cambridgeshire, England, the village being 1½ miles N. from Cambridge station, on the north bank of the Cam. It is the goal for boat-races from Cambridge, and several picturesque boat-houses have been erected along the river by the University Boat Club. Boat-building and tile manufacture are local industries. In 1894 an urban district council was established. Area, 2778 acres. Population (1881), 5706; (1901), 9583.

Chevalier, Michel (1806-1879), French political economist, was born at Limoges, 13th January 1806. In his early manhood, while employed as an engineer, he became a convert to the theories of Saint Simon; these he ardently advocated in the *Globe*, the organ of the Saint Simonians, which he edited until his arrest in 1832 on a charge of outraging public morality by its publication. He was sentenced to a year's imprisonment, but was released in six months through the intervention of M. Thiers, who sent him on a special mission to the United States to study the question of land and water transport. In 1836 he published, in two volumes, the letters he wrote from America to the *Journal des Débats*. These attracted so much attention that he was sent in the same year on an economic mission to England, which resulted in his publication (in 1838) of *Les intérêts matériels de la France*. The success of this made his position secure, and in 1840 he was appointed professor of political economy in the Collège de France. He sat for a short time (1845-46) as a member of the Chamber of Deputies, but lost his seat owing to his enthusiastic adoption of the principles of free trade. Under Napoleon III. he was restored to the position of which the revolution of 1848 had temporarily deprived him. In 1850 he became a member of the Institute, and in the following year published an important work in favour of free trade, under the title of *Examen du système commercial connu sous le nom de système protecteur*. His chief public triumph was

the important part he played in bringing about the conclusion of the commercial treaty between France and Great Britain in 1860. Previously to this he had served, in 1855, upon the commission for organizing the Exhibition of 1855, and his services there led to his forming one of the French jury of awards in the London Exhibition of 1862. He was created a member of the Senate in 1860, and continued for some years to take an active part in its discussions. He retired from public life in 1870, but was unceasingly industrious with his pen. He became grand officer of the Legion of Honour in 1861, and during the later years of his life received from many quarters public recognition of his eminence as a political economist. He died at Montpellier, 28th November 1879. Of his works, many of which have been translated into English and other languages, some of the more important (in addition to those already mentioned) are: *Cours d'économie politique* (1842-50); *Essais de politique industrielle* (1843); *De la baisse probable d'or* (1859), which was translated into English by Cobden; *L'Expédition du Mexique* (1862); *Introduction aux rapports du jury international* (1868). (R. F. S.)

Chevreul, Michel Eugène (1786-1889), French chemist, was born, on 31st August 1786, at Angers, where his father was a physician. At about the age of seventeen he went to Paris and entered Vauquelin's chemical laboratory, afterwards becoming his assistant at the Natural History Museum in the Jardin des Plantes. In 1813 he was appointed professor of chemistry at the Lycée Charlemagne, and subsequently undertook the directorship of the famous Gobelins tapestry works, where he carried out his researches on colour contrasts. In 1826 he became a member of the Academy of Sciences, and in the same year was elected a foreign member of the Royal Society of London, whose Copley medal he was awarded in 1857. He succeeded his master, Vauquelin, as professor of organic chemistry at the Natural History Museum in 1830, and thirty-three years later assumed its directorship also; this he relinquished in 1879, though he still retained his professorship. In 1886 the completion of his hundredth year was celebrated with public rejoicings; and after his death, which occurred in Paris on 9th April 1889, he was honoured with a public funeral. In 1901 a statue was erected to his memory in the museum with which he was connected for so many years. His scientific work covered a wide range, but his name is best known for the classical researches he carried out on animal fats, published in 1823 (*Recherches sur les corps gras d'origine animale*). These enabled him to elucidate the true nature of soap; he was also able to discover the composition of stearin and olein, and to isolate stearic and oleic acids, the names of which were invented by him. A practical consequence of these investigations was the manufacture of stearin candles, to the supersession of the old tallow dips. Chevreul was a determined enemy of charlatanism in every form, and one of his less-known books, inspired by the "spiritualistic" movement that arose in America about 1848 and spread to Europe a few years later, was devoted to an exposure of the folly of attaching any importance to the manifestations of the divining-rod and table-turning.

Cheyenne, the largest and most important city of Wyoming, U.S.A., capital of Laramie county and of the state, situated near the southern boundary of the state, on the high plains near the east foot of the Laramie range, at an altitude of 6054 feet. It is on the main line of the Union Pacific railway, and is the terminus of branches of the Burlington and Missouri River, and the Union Pacific, Denver, and Gulf railways. The surrounding country is

a vast cattle range, of which Cheyenne is the shipping and supply point. Near Cheyenne is the large military post of Fort Russell. Population (1880), 3456; (1890), 11,690; (1900), 14,087, of whom 1691 were foreign-born and 295 were negroes.

Chhatarpur, a native state of India, in the Bundelkhand agency. Area, 1178 square miles; population (1891), 174,148; average density, 148 persons per square mile; estimated revenue, Rs.2,50,000. The chief, whose title is Raja, is a Rajput of the Puar clan, whose ancestor dispossessed the descendant of Chhatar Sal, the founder of Bundelkhand independence, towards the end of the 18th century. The town of CHHATARPUR, which is named after Chhatar Sal, and contains his cenotaph, is situated in 24° 54' N. lat. and 79° 38' E. long., 70 miles by road S.W. of Banda. Population, 13,474. It has manufactures of paper and coarse cutlery, and a high school.

Chhattisgarh, a division of the Central Provinces, India. The total feudatory area is 29,435 square miles; the population in 1891 was 2,160,511, giving an average density of 73 persons per square mile. In 1901 the population was 1,983,496, showing a decrease of 8 per cent., due to famine. Much of the soil is still covered with forest, but it includes fertile rice land. The British division of Chhattisgarh comprises the three districts of Raipur, Bilaspur, and Sambalpur. Its area is 25,013 square miles; in 1881 the population was 3,115,997, and in 1891 it was 3,544,998, giving an average density of 142 persons per square mile. In 1901 the population was 3,274,113, showing a decrease of 8 per cent. This tract has been opened out by the Bengal-Nagpur railway, which crosses it on its way from Nagpur city to Calcutta. Several of the feudatory states have been under British management, while the chiefs were being trained during their minority in the Rajkumar college at Raipur. The number of children at school has risen from 8121 in 1892-93 to 14,839 in 1896-97, being 4.6 per cent. of the population of school-going age.

Chhindwara, a town and district of British India, in the Nerbudda division of the Central Provinces. The population of the town in 1881 was 8220, and in 1891 was 8973. The area of the district is 4630 square miles. In 1881 it had a population of 372,899, in 1891 of 407,494, showing an average density of 88 persons per square mile. In 1901 the population was 408,105. The land revenue and rates were Rs.3,34,441, the incidence of assessment being Rs.0:3:4 per acre; the cultivated area in 1897-98 was 691,697 acres, of which 8877 were irrigated from wells; the number of police was 283; the boys at school in 1896-97 numbered 3012, being 9.9 per cent. of the male population of school-going age, compared with 15.4 per cent. for the whole province; the registered death-rate in 1897 was 52.30 per thousand. It has manufactures of cotton cloth and brass-ware. Coal exists, but cannot be worked profitably in the absence of a railway.

Chiapas, a state of Mexico, bounded on the N. by the state of Tabasco, on the W. by those of Veracruz and Oaxaca, on the S. by the Pacific, and on the E. by the republic of Guatemala. Its area is 27,230 square miles. The population in 1879 was 205,362; 319,599 in 1895. The eastern plains have not yet been thoroughly explored. The principal industries are agriculture, fruit exploitation, salt extraction, and stock-raising. In 1897 it produced 2,465,100 kilograms of coffee, 10,126,998 kilograms of sugar-cane and products, 382,001 kilograms of tobacco, and 144,491 kilograms of cocoa. The state is divided politically into 11 departments and 101 municipalities.

The capital is Tuxtla Gutiérrez (population, 10,952), about $3\frac{1}{2}$ miles from the river Sabinas and 138 miles from the port of Tonala. Amongst other towns are Comitán (9316 inhabitants), Pichucalco (8549), Tapachula (8472), Tenejapa (7936), San Antonio (6715), Cuitalape (6455), La Concordia (6291), San Carlos (5977), Ococingo (5667).

Chiayari, a town of Liguria, Italy, province of Genoa, on the coast of the E. Riviera, 23 miles E.S.E. from Genoa. It possesses a citadel (restored in 1887), the shrine of the Madonna dell' Orto, with a miraculous image, and statues of Garibaldi and Mazzini. Population, about 11,000.

Chiavenna, a town of Lombardy, Italy, province of Sondrio, $6\frac{1}{2}$ miles N. from the N. end of Lake Como. Its famous beer and wine are kept in cellars hewn out of the sides of ravines. The pottery for which it has been

noted since Roman times is made out of a natural stone (*laves*). Population, about 4500.

Chicacole, a town of British India, in the Ganjam district of Madras, situated in $18^{\circ} 75' N.$ lat. and $83^{\circ} 56' E.$ long., on the right bank of the river Languliya, here crossed by a bridge, 4 miles from the sea. Population (1881), 16,355; (1891), 18,204; municipal income (1897-98), Rs.27,500. Formerly the capital of a Mahomedan province, and afterwards of a British district. Several old mosques still remain. The town was famous for its muslins, but the industry is now decayed. The roadstead and lighthouse of Calingapatam are about 16 miles to the north, and the East Coast railway has a station inland. The town has a municipal high school, two printing-presses, each issuing a vernacular newspaper, and a club.

END OF SECOND VOLUME.

A PARTIAL LIST OF THE CONTRIBUTORS

TO

THE NEW VOLUMES

OF

THE ENCYCLOPÆDIA BRITANNICA

WITH THE INITIALS WHICH HAVE BEEN AFFIXED TO THEIR
RESPECTIVE ARTICLES.

THE LIST OF CONTRIBUTORS here given is necessarily incomplete, inasmuch as the later Volumes are still in course of preparation, and all the Contributors have not yet been selected. On the other hand, the present List may contain a few names which ultimately will not appear in the final List of Contributors. Death or other cause may prevent certain writers who have undertaken the preparation of Articles from completing the contributions which they were to furnish. A full List, compiled when the final Volume goes to press, will be given later. The present List, however, includes the names of all those who have written signed Articles for the first Volume.

After the few words of description which accompany the names are given the initials of the different authors as they have been affixed to the Articles contributed by them.

The Publishers congratulate themselves that in this List of a thousand names are to be found not only the most famous scholars and writers of Great Britain, but of the whole world.

A

ABBE, Prof. Cleveland, A.M., Ph.D., LL.D.; Meteorologist, U.S. Weather Bureau; author of 'Atmospheric Radiation,' etc.; editor of 'Monthly Weather Review'; Lecturer on Meteorology, Johns Hopkins University. (C. A.)

ABBOT, Rev. Lyman, D.D.; editor of 'The Outlook' (New York); associate editor of 'The Christian Union' (New York) with Henry Ward Beecher, whom he succeeded as pastor of Plymouth Church, Brooklyn; author of 'Christianity and Social Problems,' 'Life of Christ,' 'Theology of an Evolutionist,' 'Life and Epistles of St Paul.' (L. A.)

ABNEY, Sir William de Wiveleslie, K.C.B., D.Sc., D.C.L., F.R.S.; Principal Assist. Sec., Board of Education, South Kensington, since 1899; President, Royal Astronomical Society, 1895-96; author of 'Photography' in Ninth Edition of the 'Ency. Brit.'; 'Instruction in Photography,' 'Treatise on Photography,' 'Colour Vision,' 'Colour-Measurement and Mixture,' 'Thebes and its Five Great Temples,' in part of 'The Pioneers of the Alps.' (W. de W. A.)

ADAMS, B. B.; associate-editor of the 'Railroad Gazette' (New York). (B. B. A.)

AIRY, Wilfred, B.A., M.I.C.E.; Examiner of Inspectors of Weights and Measures, Board of Trade; author of 'Levelling and Geodesy,' 'Weighing Machines,' etc. (W. A.)

AKERS, C. E.; author of 'Argentine, Patagonian, and Chilian Sketches,' etc. (C. E. A.)

ALCOCK, Charles William; Secretary Surrey County Cricket Club since 1872; Hon. Sec. Football Association, 1887-90; author of 'Football our Winter Game, 1887,' editor of 'Cricket Newspaper,' 1882-1900, 'Football Annual,' 'Cricketer's Annual' (Lillywhite's), etc. (C. W. A.)

ALEXANDER, Gen. Edward Porter; General of Ordnance; and later Brigadier-General of Artillery and Chief of Artillery in Gen. Longstreet's Corps, Confederate Army. (E. P. A.)

ALEXANDER, W. D., Honolulu; author of 'A Brief History of the Hawaiian People.' (W. D. A.)

ALLBUTT, Thomas Clifford, M.A., M.D., LL.D., D.Sc., F.R.S.; Regius Professor of Physic, Camb., since 1892; Commissioner in Lunacy, 1889-92; author of 'The Ophthalmoscope in Medicine,' 'Goulstonian Lectures (On Visceral Neuroses),' 'On Scrofula,' 'Science and Medical Thought'; editor of 'System of Medicine and Gynecology,' etc.; inventor of short clinical thermometer. (T. C. A.)

ALLDRIDGE, T. J., F.R.G.S., F.Z.S.; for many years Travelling Commissioner of Sierra Leone; District Commissioner of Sherbro District, Sierra Leone; author of 'The Sherbro and its Hinterland.' (T. J. A.)

ANDERSON, Miss A. M.; Principal Lady Inspector of Factories, Home Office. (A. M. A.)

ANDERSON, W., F.R.C.S., the late; Comp. of the Order of the Rising Sun (Japan); Professor at Royal Academy; Chairman of Council of the Japan Society; Medical Director, Imperial Naval Medical College, Tokio; author of 'The Pictorial Arts of Japan,' 'Japanese Wood Engravings,' 'Cat. of Chinese and Japanese Pictures in British Museum.' (Wm. A.)

ANDERSON, Lt.-Col. W. P.; Chief Engineer and Superintendent of Lights, Department of Marine and Fisheries, Ottawa, Canada. (W. P. A.)

ANDREWS, Hon. Elisha Benjamin, LL.D.; Chancellor of the University of Nebraska; late Superintendent of Schools of the City of Chicago; formerly President of Brown University; author of 'Institutes of General History,' 'Institutes of Economics,' 'History of the United States,' etc. (E. B. A.)

ANSTRUTHER-THOMSON, Major W., F.G.S., F.S.A.; Inspector of Concentration Camps, S.A. (W. A.-T.)

ARCHER, William; dramatic critic of 'World' (London), 1884 onwards; edited and translated Ibsen's 'Prose Dramas'; author of 'Life of Macready,' 'Masks or Faces,' 'The Theatrical World,' 'Study and Stage,' 'America To-day, 1900,' 'Poets of the Younger Generation,' etc. (W. A.)

ARMSTRONG, Edmund Archibald, Barrister-at-Law, Inner Temple. (E. A. A.)

ARMSTRONG, Henry Edward, Ph.D., LL.D., F.R.S.; Professor of Chemistry at the City and Guilds of London Central Institute, South Kensington; author of 'Carbon,' etc., in Ninth Edition of 'Ency. Brit.'; 'Introduction to the Study of Organic Chemistry.' (H. E. A.)

ARMSTRONG, Sir Walter; Director of the National Gallery of Ireland; author of 'Sir Joshua Reynolds,' 'Thomas Gainsborough,' 'Sir Henry Raeburn,' 'Alfred Stevens,' 'Peter de Wint,' 'Velasquez,' 'Scottish Painters,' 'J. M. W. Turner,' etc., and co-editor of 'Bryan's Dictionary of Painters.' (W. A.)

ASHWORTH, Philip A., Dr. Juris, of the Inner Temple, Barrister-at-Law; editor of Taswell-Langmead's 'Constitutional History of England,' translator of Gnaeus's 'History of the English Constitution,' etc. (P. A. A.)

ASKWITH, Rev. Edward Harrison, M.A., B.D.; Chaplain of Trinity College, Cambridge; author of 'Christian Conception of Holiness,' 'Epistle to the Galatians,' etc. (E. H. A.)

ASTON, Major George Grey, R.M.A.; late Professor of Fortification, Royal Naval College, Greenwich. (G. G. A.)

ASTON, William George, B.A., M.A., Hon. D.Lit., C.M.G.; student interpreter in Japan, 1864; interpreter and translator to British Legation at Yedo, 1870; assistant Japanese Secretary, Yedo, 1875-82; acting Consul, Hiogo, 1880-83; Consul-General for Corea, 1884; Japanese Secretary, Tokio, 1886; author of 'A Grammar of the Japanese Spoken Language,' 'A Grammar of the Japanese Written Language,' 'A Translation of the Nihongi, or Annals of Ancient Japan,' 'History of Japanese Literature,' etc. (W. G. A.)

ATWATER, Wilbur Olin, Ph.D.; Professor of Chemistry, Wesleyan University, U.S.A.; Special Agent of the U.S. Department of Agriculture in charge of Nutrition investigations. (W. O. A.)

AVES, Ernest, M.A.; formerly Sub-Warden of Toynbee Hall; author of papers on sociology and economics. (E. A.)

AXON, William Edward Armitage, LL.D.; late Dep. Librarian Manchester Free Libraries; author of 'Manchester' in Ninth Edition of 'Ency. Brit.'; 'The Annals of Manchester,' 'Manchester a Hundred Years Ago,' 'Lancashire Gleanings,' 'Stray Chapters in Literature,' 'Folk-lore and Archaeology,' etc. (W. E. A.)

B

BACON, Edwin Monroe, M.A.; editor of 'Time and the Hour' (Boston, U.S.A.); sometime editor-in-chief of the 'Boston Globe,' the 'Boston Advertiser,' and the 'Boston Post'; author of 'Boston Illustrated,' 'Bacon's Dictionary of Boston,' 'Boston of To-day,' etc. (E. M. B.)

BADEN-POWELL, Maj. Baden F. S.; inventor of man-lifting kites; late President Aeronautical Society; author of 'In Savage Isles and Settled Lands,' many articles on ballooning, etc. (B. F. S. B.-P.)

BAGWELL, Richard, M.A.; author of 'Ireland' in the Ninth Edition of the 'Ency. Brit.'; 'Ireland under the Tudors,' 'A Plea for National Education,' etc. (R. B.)

BAINES, Jervoise Athelstane, C.S.I.; Hon. Sec. (gold medallist) and Vice-President Royal Statistical Society; Census Commissioner under Government of India, 1889-93; employed at India Office and as secretary to Royal Commission on Opium, 1894-95; author of 'Official Reports on Provincial Administration, on Indian Census Operations, 1881-91, on Indian Progress, 1894, many papers, ethnographic and statistical, for London societies. (J. A. B.)

- BAKER, Henry Frederick, M.A., F.R.S.;** Fellow and Lecturer of St John's College, Cambridge; University Lecturer in Mathematics. (H. F. BA.)
- BALCARRES, Lord, M.P., F.S.A., F.S.A.S.;** Trustee of National Portrait Gallery, London; Hon. Sec. Society for Protection of Ancient Buildings; Vice-Chairman of National Trust. (B.)
- BALDRY, Alfred Lys, artist;** author of 'Albert Moore: his Life and Works,' 'The Life and Works of Marcus Stone, R.A.,' 'Sir John Everett Millais,' 'Hubert von Herkomer,' etc. (A. L. B.)
- BALDWIN, Hon. Simeon Eben, A.M., LL.D.;** Judge of the Supreme Court of Errors of Connecticut; Professor of Constitutional and Mercantile Law, Corporations, and Wills, Yale University; sometime President of the American Bar Association and American Social Science Association; author of 'Baldwin's Connecticut Digest,' 'Cases on R.R. Law,' 'Modern Political Institutions,' etc. (S. E. B.)
- BALDWIN, W. H., Jr.;** President of the Long Island R.R. Co., U.S.A. (W. H. B.)
- BALE, Edwin, R.L.;** Art Director, Cassell and Company; Hon. Sec. Artists' Committee for Promoting Art Copyright Bill, etc. (E. BA.)
- BALFOUR, Isaac Bayley, M.D., D.Sc., M.A., F.R.S., F.L.S.;** Regius Keeper of Royal Botanic Garden, Edinburgh; Professor of Botany, University of Edinburgh; Transit of Venus Expedition to Rodriguez, 1874; Regius Professor of Botany, University of Glasgow, 1879-84; explored island of Socotra, 1880; Sherardian Professor of Botany, University of Oxford, and Fellow of Magdalen College, 1884-88; author of 'Botany of Rodriguez,' 'Botany of Socotra,' editor of 'Annals of Botany.' (I. B. B.)
- BANCROFT, Frederic, Ph.D.;** Chief of Bureau of Rolls and Library, U.S. Department of State; author of 'Life of William H. Seward,' etc. (F. BA.)
- BANISTER, G. H., M.I.C.E., M.I.M.E.;** late Assistant to Superintendent of the Royal Carriage Department, Woolwich; Whitworth Scholar. (G. H. BA.)
- BARCLAY, Thomas, LL.B., Ph.D.;** member of the Institute of International Law; Vice-President of the International Law Association; Examiner in Jurisprudence and International Public and Private Law to the University of Oxford, 1900; member of the Supreme Council of the Congo Free State; Vice-President of the Franco-Scottish Society; President of the British Chamber of Commerce in Paris, 1899-1900; Knight of the Legion of Honour and of the Order of Leopold; author of 'Companies in France,' and other law books, all the articles on International Law in the 'Encyclopedia of the Law of England,' etc. (T. BA.)
- BARING, The Hon. Maurice;** Attaché to the British Embassy, Paris, 1899; Third Secretary to the British Embassy, Rome, 1902. (M. BA.)
- BARLOW, Major H. W. W., R.A.;** Secretary to Chief Superintendent, Royal Ordnance Factories, Woolwich. (H. W. B.)
- BARNES, William Emery, D.D.;** Fellow of Peterhouse, Cambridge; Hulsean Professor of Divinity, Cambridge; assist. editor of 'Journal of Theological Studies'; Lecturer in Hebrew at Clare Coll. Camb., 1885-94; in Hebrew and Divinity at Peterhouse, 1899-1901; author of 'The Genuineness of Isaiah xxiv.-xxvii.,' 'Canonical and Uncanonical Gospels,' 'The Peshitta Text of Chronicles,' I. II. Chronicles, with Introduction and Notes (Cambridge Bible), Isaiah (Churchman's Bible). (W. E. B.)
- BARNETT, Rev. Samuel Augustus, M.A.;** Canon of Bristol; Founder and Warden of Toynbee Hall, Whitechapel; President of the Sunday Society; Chairman Whitechapel Board of Guardians, 1894; Chairman of Children's Country Holiday Fund; Chairman Pupil Teachers' Scholarship Fund; author of 'Practicable Socialism' with Mrs. Barnett, 'Service of God.' (S. A. B.)
- BARRETT, F. N.;** editor of the 'American Grocer' (New York). (F. N. B.)
- BARTLET, Rev. J. Vernon, M.A.;** Professor of Church History, Mansfield College, Oxford; author of 'Early Church History,' 'The Apostolic Age,' etc. (J. V. B.)
- BARTLEY, George Christopher Trout, M.P.;** Assistant-Director of Science Division of Science and Art Department, London, till 1880; established National Penny Bank, 1876; author of 'A Square Mile in the East of London,' 'Schools for the People,' 'Provident Knowledge Papers,' 'The Seven Ages of a Village Pauper,' 'The Parish Net.' (G. C. T. B.)
- BARWICK, G. F.;** Assistant Keeper of Printed Books and Superintendent of Reading-room, British Museum; author of 'International Exhibitions,' 'The Laws Regulating Printing and Publishing in Spain,' and translator of various works of travel, etc. (G. F. B.)
- BASSETT, John Spencer, Ph.D.;** Professor of History, Trinity College, N.C.; author of 'Constitutional Beginnings of North Carolina,' 'Slavery and Servitude of the Colony of North Carolina,' 'Anti-Slavery Leaders of North Carolina,' 'Slavery in the State of North Carolina.' (J. S. BA.)
- BASTABLE, C. F., M.A., LL.D.;** Professor of Political Economy, Dublin University, 1882; author of 'Money' in Ninth Edition of 'Ency. Brit.,' 'Theory of International Trade,' 'Commerce of Nations,' 'Public Finance,' 'Dictionary of Political Economy,' and 'Economic Journal.' (C. F. B.)
- BATHER, Francis Arthur, M.A., D.Sc., F.G.S.;** Natural History Museum, South Kensington; Hon. Member Soc. Linnéenne de Normandie; author of 'Concise Knowledge of Natural History,' 'The Genera and Species of Blastoides,' 'Echinoderma' (in Lankester's 'Zoology'), 'The Crinoidea of Gotland,' etc. (F. A. B.)
- BAUERMAN, H., F.G.S.;** Lecturer on Metallurgy, Ordnance College, Woolwich; author of 'Bismuth,' 'Coal,' 'Fuel,' 'Furnace,' etc., in Ninth Edition of 'Ency. Brit.,' 'A Treatise on the Metallurgy of Iron,' 'Text-book of Systematic Mineralogy,' etc. (H. B.)
- BEALBY, J. T., B.A.;** sometime acting editor of 'Scottish Geographical Magazine'; author of 'A Daughter of the Fen,' and numerous geographical magazine articles; joint author of 'Stanford's Compendium Europe'; translator of Sven Hedin's 'Through Asia.' (J. T. BE.)
- BEDDARD, Frank Evers, M.A., F.R.S.;** Prosector of Zoological Soc. of England since 1884, and Vice-Sec. since 1898; formerly Lecturer on Biology at Guy's Hospital; has been Examiner in Zoology and Comparative Anatomy, University of London, and of Morphology at Oxford; now Examiner in the University of New Zealand; naturalist to 'Challenger' Expedition Commission 1882-84; author of 'Worm' in Ninth Edition of 'Ency. Brit.,' 'Animal Coloration,' 'Text-book of Zoogeography,' 'A Monograph of the Oligochaeta,' 'Structure and Classification of Birds.' (F. E. B.)

FITZMAURICE-KELLY, James; corresponding member of the Spanish Academy; author of 'A History of Spanish Literature,' 'The Life of Miguel de Cervantes Saavedra,' etc. (J. F. K.)

FLEMING, C. J. N., B.A.; Scottish International Football Player; member of Committee of Scottish Rugby Football Union. (C. J. N. F.)

FLEMING, John Ambrose, M.A., D.Sc., F.R.S.; Pender Professor of Electrical Engineering, Univ. College, London; Fellow of Univ. Coll. London; author of 'Treatise on the Alternating Current Transformer,' 'Electric Lamps and Electric Lighting,' 'Magnets and Electric Currents,' 'A Handbook for the Electrical Laboratory and Testing Room.' (J. A. F.)

FOOTE, Arthur De Wint; Superintendent of North Star Mining Company, California; Member of the American Society of Civil Engineers. (A. De W. F.)

FORBES, Dr H. O., LL.D., F.R.G.S.; Director of Museums, Liverpool; author of 'A Naturalist's Wanderings in the Eastern Archipelago,' etc. (H. O. F.)

FORD, Worthington Chauncey, Public Library, Boston, U.S.A.; Chief of Bureau of Statistics, U.S. Department of State, 1885-89, and of Bureau of Statistics, U.S. Treasury Department, 1893-98; author of 'American Citizen's Manual,' etc. (W. C. F.)

FORD, W. J., M.A.; author of 'A Cricketer on Cricket.' (W. J. F.)

FORTIER, Alcée, Litt.D.; Professor of Romance Language, Tulane University, New Orleans; sometime President of the Modern Language Association of America, and of the American Folk-Lore Society; President of the Louisiana Historical Society since 1894; author of 'Louisiana Studies,' 'Louisiana Folk Tales,' etc. (A. F.)

FOSTER, Clement Le Neve, B.A., D.Sc., F.R.S.; Professor of Mining at Royal School of Mines, London; Examiner in Mining for the Board of Education; Geological Survey of Great Britain, 1860-65; H.M. Inspector of Mines, 1878-1901; author of 'Mining in Ninth Edition of 'Ency. Brit.,' 'Ore and Stone Mining,' etc. (C. L. N. F.)

FOSTER, Hon. John Watson, LL.D.; ex-U.S. Minister to Mexico, Russia, and Spain; U.S. Secretary of State 1892-93, and Agent of the United States in the Behring Sea Arbitration. (J. W. F.)

FOSTER, Sir Michael, D.C.L., D.Sc., LL.D., K.C.B., F.R.S., M.P.; Professor of Physiology, Cambridge; secretary R.S.; President British Ass., 1899; author of 'Physiology' in Ninth Edition of 'Ency. Brit.,' 'Text-Book of Physiology,' 'Lectures on History of Physiology'; joint-editor of 'Scientific Memoirs of Thomas Henry Huxley,' etc. (M. F.)

FOWLER, G. H., Ph.D. Leipzig; late Hon. Secretary, Marine Biological Association, Plymouth; edited 'The Hydromedusa,' and 'The Leptomedusa,' 'Marshall's The Frog,' 'Erichson's 'Scientific Progress in Entomology.' (G. H. F.)

FOX, Francis, M.I.C.E.; author of 'On the Results of Trials of Varieties of Iron Permanent Way,' and various papers on 'Ventilation, Tunnelling,' etc. (F. F.)

FOX, Major; head of London Salvage Corps. (F. J. F.)

FRANKLIN, Fabian, Ph.D.; editor of 'Baltimore News,' Baltimore, U.S.A.; formerly Professor of Mathematics, Johns Hopkins University. (F. F.)

FRANTZ, Henri; art critic, 'Gazette des Beaux Arts,' Paris. (H. F.)

FREEM, William, LL.D., F.G.S. F.L.S., F.R.S.; Lecturer on Agricultural Entomology, Edin. Univ.; author of 'Elements of Agriculture,' 'Soils and their Properties,' 'The Complete Grazer,' etc. (W. F.)

FREEMANTLE, Commander S., R.N.; part author of 'Nautical Terms and Phrases in French and English,' etc. (S. F.)

FRERE, Rev. Walter Howard, M.A.; Superior of the Community of the Resurrection; author of 'A New History of the Book of Common Prayer,' 'Notes on the Early History of the Use of Incense'; editor 'Bibliotheca Musico-Liturgica,' 'The Marian Reaction,' etc. (W. H. F.)

FRY, Rt. Hon. Sir Edward, B.A., D.C.L., LL.D., F.R.S., F.S.A., F.L.S.; Judge of High

Court, Chancery Division, 1877-83; Lord Justice of Appeal, 1883-92; Fellow University of London and Univ. Coll. London; Hon. Fellow of Balliol Coll. Oxford; presided over the Royal Commission on the Irish Land Acts, 1897-98; author of 'Quakers' in Ninth Edition of 'Ency. Brit.,' 'The Specific Performance of Contracts,' 'British Mosses,' 'James Hack Tuke,' etc. (E. F.)

FULTON, Robert Burwell, A.M., LL.D.; Chancellor of the University of Mississippi; author of 'Mississippi, State' in Ninth Edition of 'Ency. Brit.' (R. B. F.)

G

GADOW, Hans Friedrich, Ph.D., Hon. M.A. Cambridge, F.R.S.; Strickland Curator and Lecturer on Zoology, Cambridge; British Museum, Natural History Department, 1880-82; author of 'In Northern Spain,' 'A Classification of Vertebrata,' 'Aves in Bronn's Animal Kingdom,' 'Amphibia and Reptiles,' and papers in Royal Society Philosophical Transactions and other scientific periodicals. (H. F. G.)

GAMBLE, F. W., editor of 'Junior Course of Practical Zoology,' 'Flatworms and Mesozoa,' etc. (F. W. G.)

GANNETT, Henry; Chief Geographer U.S. Geological Survey; Chief Geographer 10th, 11th, and 12th U.S. Censuses; author of 'Idaho,' etc., in Ninth Edition of 'Ency. Brit.,' 'Dictionary of Altitudes,' 'Statistical Atlas of the U.S.,' etc. (H. G.)

GARCKE, Emil, M.I.E.E., F.S.S.; Manager of the Brush Electrical Engineering Co.; Chairman Elect. Sect. London Chamber of Commerce, 1884-88; Member of Council, Tramways and Light Railways Assoc.; author of 'Manual of Electrical Undertakings,' joint-author of 'Factory Accounts.' (E. G.)

GARDNER, Ernest Arthur; Yates Professor of Archaeology, University College, London; Director of British School of Archaeology at Athens, 1887-95; author of 'Handbook of Greek Sculpture,' 'Journal of Hellenic Studies,' many articles on Greek art, archaeology, and excavations, from 1882; joint-editor of the 'Journal of Hellenic Studies' since 1897. (E. G.)

GARDNER, J. Starkie, English Iron Worker and Expert; author of 'English Enamels,' 'Ironwork,' 'Armour in England,' etc. (J. S. G.)

GARDNER, Percy, Litt.D., F.S.A.; Line and Merton Professor of Classical Archaeology, Oxford University; Corresp. Member of the Academy of Sciences, Göttingen; Member of the Archaeological Institutes of Germany, Austria, America, Greece, etc.; Assistant at British Museum, 1871; Fellow of Christ's College, Cambridge, 1872; Disney Professor of Archaeology, Cambridge, 1880; editor of 'Journal of Hellenic Studies'; author of 'Corinth,' 'Ephesus,' in Ninth Edition of 'Ency. Brit.,' 'The Parthian Coinage,' 'Samos and Samian Coins,' 'Types of Greek Coins,' 'Numismatic Commentary on Pausanias,' 'New Chapters in Greek History,' 'Manual of Greek Antiquities' (with Mr. Jevons), 'Sculptured Tombs of Hellas,' etc. (P. G.)

GARNETT, Richard, LL.D., C.B.; Assistant in Library of British Museum, 1851; Superintendent of Reading Room, 1875; Keeper of Printed Books, 1890-1899; edited the British Museum Catalogue from 1881 to 1890; author of 'Alexander VI.,' 'Anthology,' 'Augustan History,' 'Byzantine Historians,' 'Chateaubriand,' 'Hazlitt,' 'Leigh Hunt,' etc., in Ninth Edition of 'Ency. Brit.,' 'Relics of Shelley,' 'Life of Carlyle,' 'Life of Emerson,' 'Twilight of the Gods,' 'Life of Milton,' 'Age of Dryden,' 'William Blake,' 'A History of Italian Literature,' 'Life of Edward Gibbon Wakefield.' (R. G.)

GARNETT, William, M.A., Hon. D.C.L. Durham; Sec. Technical Education Board, London Co. Council; Whitworth Scholar (first); Demonstrator in Physics, Cambridge; Prof. of Math., Physics and Mechanics, University Coll. Nottingham; Principal, Durham Coll. of Science, Newcastle-upon-Tyne; author of 'Dynamics,' 'Energy,' 'Evaporation,' 'Hydrometry' in the Ninth Edition of 'Ency. Brit.,' 'Elementary Dynamics,' 'Elementary Mechanics,' etc. (W. G.)

GARSTANG, Walter, M.A., F.Z.S.; late Fellow of Lincoln Coll., Oxford; Naturalist in charge of Fishery Investigations, Marine Biol.

- Assoc.; delegate of H.M. Gov. to Internat. Conf. on Exploration of the Sea, Christiania, 1901; medalist of the Société Centrale d'Agriculture et de Pêche, Paris; author of numerous memoirs on Marine Biology, etc. etc. (W. G. A.)
- GATES, Lewis Edwards, A.B.;** Assistant Professor of English, Harvard University; author of 'Selections from Jeffrey,' 'Selections from Newman,' 'Three Studies in Literature.' (L. E. G.)
- GEDDIE, John;** on the editorial staff of the 'Scotsman,' Edinburgh; author of 'The Water of Leith,' etc. (J. G. E.)
- GEIKIE, Sir Archibald, Hon. D.C.L., D.Sc., LL.D., F.R.S., F.G.S.;** correspondent of Institute of France, of the Lincei, Rome, of the Academies of Berlin, Vienna, Belgium, Stockholm, Turin, Munich, Christiania, Göttingen, Kais. Leopold, Carol., Philadelphia, New York, National Academy of Sciences of United States, etc.; Director Geological Survey of Scotland, 1867; first Murchison Professor of Geology and Mineralogy, Edinburgh, 1871-82; Foreign Sec. Royal Society, 1890-94; President Geological Society, 1891-92; President British Association, 1892; Director-General Geological Survey of United Kingdom, and Director Museum of Practical Geology, London, 1882-1901; author of 'Geography' (Physical), 'Geology,' 'Hutton, James,' 'Murchison,' 'Scotland' (geology), 'Vesuvius,' in Ninth Edition of 'Ency. Brit.,' 'Memoir of Edward Forbes' (with G. Wilson), 'Geological Map of Scotland' (with Murchison), 'The Scenery of Scotland viewed in connexion with its Physical Geology,' 'Text-book of Geology,' 'New Geological Map of Scotland,' 'The Ancient Volcanoes of Britain,' etc. (A. G. E.)
- GIANNINI, Torquato C.,** State Advocate, San Marino; author of 'Laws and Decrees of the Republic of San Marino,' etc. (T. G.)
- GIBBONS, H. E. Cardinal James, Archbishop of Baltimore, U.S.;** author of 'The Faith of Our Fathers,' 'Our Christian Heritage,' 'The Ambassador of Christ.' (J. G. E.)
- GIBBS, George;** Consulting Engineer to the Baldwin Locomotive Works, and the Westinghouse Electric Manufacturing Co.; formerly Mechanical Engineer for the Chicago, Milwaukee, and St. Paul R.R. Co.; Member Am. Soc. Mech. Engineers, and Am. Soc. Civ. Engineers. (G. G.)
- GIBSON, George Alexander, M.D., D.Sc. Edin., F.R.C.P. Edin., F.R.S. Edin.;** Hon. Member Norwich Med. Chir. Soc.; Fellow and Member of many societies in England and Scotland; Physician to Royal Infirmary of Edinburgh; Lecturer on Medicine in School of Medicine of Royal Colleges; editor of the 'Edinburgh Med. Journ.' since 1896; Secretary, Royal Coll. of Physicians, Edin., 1884-94; Member of Council of the College since 1894; author of 'Physical Diagnosis' (part), 'Cheyne-Stokes Respiration,' 'Diseases of the Heart and Aorta'; editor of 'Text-Book of Medicine,' 1901. (G. A. G.)
- GIFFEN, Sir Robert, K.C.B., F.R.S.;** assistant editor of 'Economist,' London, 1868-76; Chief of Statistical Department, Board of Trade, 1876-82; Assistant Secretary Board of Trade, and afterwards Controller-General of Commercial, Labour, and Statistical Departments, 1882-97; President of Statistical Society, 1882-84; author of 'American Railways as Investments,' 'Stock Exchange Securities,' 'Essays in Finance,' 'The Progress of the Working Classes in the Last Half-Century,' 'The Growth of Capital,' 'The Case against Bimetallism,' etc. (R. G.)
